I have known a gentleman, who, at the time of the French invasion in Tyrol, being transported from Trent to Milan as a political hostage, lost entirely the use of his senses; he thought himself the Austrian emperor, and as such he held imaginary drawing-rooms, levees, and other similar public shows; he wore and distributed decorations, and appointed places; and he went always in a rage if any of his acquaintances attempted to dispute his dignity. In this state he remained for two years, under the treatment of some eminent men, at the expiration of which time I was charged by his family to conduct him back to Trent.

I caused him to be transported by night from his dwelling; no one was in the coach but myself and a faithful servant. During the day-time we stopped for a few hours at a country inn. The lunatic was placed in a solitary room. His diet was biscuit and water. The third day we arrived in Trent, where he was taken to his house, and into his own bed, without knowing it. The next morning, on opening his eyes, the sign of his own room, and of his garden, had such a salutary effect upon him, that he gave up his emperorship, with all his follies.

When this happened, I was but a young man; my plan was but the inspiration of the moment, and not the result of any system. Should it not be possible that I was then in a state of natural magnetic clear-sight? Is it not probable that we all bear within ourselves something innate, which now and then brings forth fruits far superior to those produced by external experience? Is that not the true origin of all arts and sciences? Is it only the poet that has a God within himself? I think this, like the material light, is latent in all natural objects;

thus the divine spark of spiritual light, of that light which excels all human learning, is latent in every human being. *Est deus in nobis.* There is something of a God within our bosom.

THE ALPINE PHILOSOPHER.

THE MUTILATION OF A MANUSCRIPT, OR THE SORROWS OF A SCRIBE.

To sit at night and pen the labour'd line,
To waste the penny candle or the lamp,
To singe your whiskers, should your head decline,
Worn by fatigue, or tortured by the cramp;
But following still the first and great design,
The brilliant metaphor and trope to stamp;
Dash, period, comma, with due punctuation;
Already warm with public approbation.
'Tis finish'd, and directed "For the Shepherd," seal'd
With variegated wax, and well secured,
In fancy wrapper properly conceal'd,
From prying curiosity insured.
You wait next week—when oh! with blood congeal'd,
Thunder and curses, this can't be endured!
"To correspondents," there it may be read,
"Pray do not pester us,"—subscription "[Ed.]"
Again you feel the "*itoh*" (for writing); take
The pen, and next proceed to "*scratch*,"—the paper;
Tho' passion's boiling, and your hand may shake,
Once more you scribble by the midnight taper.
"Sir, Shepherd, Editor, you quite mistake."
(If I were near I'd make you cut a caper!
The stupid printer, and more stupid editor,
For popular contempt have made me creditor!)
"I am resolved at once, Sir, to withdraw
My patronage from you, who're so unworthy.
No better taste! All critics are a bore;
I really think their wits must be quite dearthy;
My mind is ruffled, and my temper sore,
Your notions are so grovelling and so earthy.
But since I do not wish downright to kill you,
I've sent *another essay*.—Print it, will you?"
The style is epic, and the subject's grand,
As you'll discover ere you have perused it;
'Tis written accurately, neat and bland
As Perry's pen would let me, for I used it.
I hope your judgment, *this time*, will withstand
The base attempts of those who have abused it;
Meantime my patience "*manet*" (that's *endures*).
Till the next number.—Farewell—I am your's.
Hurrah! my name's in print!—but stop! what's this?
A blunder, I declare! Eternal powers!
Confound the senseless scoundrels! Yes it is!
Behold the meed of literary hours!
I'll write no more—'twould mar my future bliss;
My blooming sweets are all repaid with sour.
I'll cut my—no! henceforth my labour's stinted;
An author's meaning never can be printed.

QUIZZICUS.

P. 8. On reference to my last article, I perceive that abomination of abominations, the apostrophe, standing where it ought not, viz., in the fourth line of the last stanza but one. The compositor has been too greedy for "*fat*," and so made my verse halt a foot. Perhaps the latent satire contained in these verses may be serviceable to printers and correspondents: "*Arcades ambo.*" This sally is the *antipole* to your gravity.

Yours, in the bonds of Momus, Q.

WITCHCRAFT, &c.

It is a common thing for our modern liberals to turn up the lip at this, as well as a hundred other subjects of which they know nothing at all. It is quite a conclusive proof of mental imbecility or insanity with them, if a man is found to possess even a remnant of faith in such vulgar nonsense; nay, they go so far as to conclude that, because the faith was formerly universal, from the king on the throne and the leaders of the scientific world, down to the meanest and most illiterate subject, that insanity must have been at one time the universal character of the human species. Little do they imagine that our posterity will have as good reason for a similar opinion of this philosophizing, but illogical and stupid, generation. "A philosopher! a man of talent! why, he believed in witchcraft!" says a liberal of the nineteenth generation. This is quite enough: and the judge, who, in former times, condemned an old woman upon evidence which would have hung a murderer, or transported a thief, is a fool, and something worse, for passing sentence upon such an ideal crime.

But if any person will be at the pains to examine the evidence of many of those trials, he will, if a candid person, at once discover that it was impossible for the judge to evade the necessity of passing sentence upon the accused. The evidence is quite as complete as that of any modern trial; it is supported by the oaths of the different witnesses, corroborated, as usual, by the tests of cross-examination: much more conclusive and circumstantial than the evidence which is now considered sufficient to prove a debt, or, lately, to affiliate a bastard child, which consists of nothing more than the oath of an individual. In the trials of witchcraft the witnesses are numerous, and the evidence consistent (we don't say in every case). Whatever, therefore, we may think of the subject, we have no right to speak in disparagement of the characters of the judges who presided on such occasions, and lent an ear to the tales of the marvellous. They acted in the spirit of the age to which they belonged, and of the laws which they administered; and we have no doubt that those laws were necessary. Laws are never made to create a crime; they only come into being after it is found necessary to repress the evil by legislative means. The fact, therefore, of laws being enacted against witchcraft is a proof that some sort of mysterious mischief was wrought upon the minds and persons of individuals by means which could be classed under no other category of moral evil than that of superhuman or diabolical.

But how does it happen that such species of diabolism disappear with the progress of education? Just in the same manner as weeds disappear when the larger plants surmount and suffocate them. Ignorance and individualism, or feudalism, are the soil and the sunshine which bring all such poisonous herbs to perfection: they die by the influence of the social principle. Thus we find that, wherever such practices prevail, there also predominate in extreme degree the likings and dislikings of personal prejudices, which in former times were carried to such an extravagant excess that families and tribes were trained from infancy to the hatred and persecution

of one another, and to regard it as a moral duty which they owed to God and their kin to preserve this animosity until death. The spite, the revenge, the envy and malice, which were thus engendered, are inconceivable to us; but on the other hand, the generosity and fidelity which they were taught to maintain towards kindred and allies, were equally remarkable. With the virtues, however, we have nothing to do; the vices alone were the sources of that mysterious power which wrought on the imagination of individuals of peculiar organization, and produced such effects as history and tradition record.

This is a simple way of accounting for many of the phenomena attributed to witchcraft, but it is not a satisfactory explanation of all. There are many which can be accounted for in no other manner than by a species of revelation. There have always been two species of revelation in the world; one which devoted itself to universal subjects, which has given birth to religion; and one which devoted itself to individual subjects, which has given birth to superstition. The stream of the one has come down through the Jewish and Christian church; the other belongs in an especial manner to the Gentile church, and flourished in the days of the oracular shrines of the ancient pagans, which gave many remarkable responses, and commanded the faith of the majority of the population and literati of the age. These two have always been antipodes to each other. Moses was commanded to destroy the opposite species of revelation to his own, and the other had always an antipathy to the system of unity to which Moses and the Jews belonged. Since Christianity appeared, they have gradually blended together, and continue so to this day. Thus we find that our modern wizards, sorcerers, and other students of the arts of diabolism, always invoke the name of Jesus Christ, and the holy angels, as the ministering patrons of their mysterious rites.

As we ourselves are convinced that there is, and always has been, in the world a revelation of a universal character, which treats of the destiny of the species or humanity at large, as contradistinguished from the individual; so we have as little doubt that there is, and always has been, a revelation of an individual character, which is given to different individuals in different degrees of perfection, and is sometimes counterfeited by others for mercenary purposes. We have examined this subject experimentally, and been satisfied in our own mind that there is a foundation for many of the popular opinions respecting superhuman influences. But we are also satisfied, in accordance with our own double doctrine of universalism, that whatever truth there may be in sorcery, witchcraft, peeping, chiromancy, &c., there is also a greater mixture of deception, because man is a finite being, and cannot possibly understand the infinite language of Nature. We have met with persons who could write down the names of any individual who was brought to them. We have tried them over and over again, and found them correct; and in a place like London, the very circumstance of a man publishing to the world his capability of doing so is wonderful enough; but to accomplish it we confess is past belief, except to such curious fanatics as ourselves, who have put it to the test. But these per-

sons, along with many striking things which they can tell and predict, have so much error, that it is impossible any intelligent mind can ever be directed or counselled by them. This is a wise provision of Nature, who follows the same laws in this as in the revelation of universalism, that is, religion; she does it all in such a way as to throw us upon the resources of our own minds, and yet lets out so much of the *wonderful* as to keep alive the faith of the spiritual world, which is necessary to the final settling of all metaphysical and theological questions.

The balance is thus made even. One party considers all as deception practised by artful rogues, and disdains to investigate the subject with that curiosity and interest which is necessary to the discovery of truth; the other party falls into the opposite extreme of slavish fear and superstition. This latter is the error of the vulgar mind; the former is the supercilious and contemptuous peculiarity of the modern churchmen and infidels. We, as usual, differ from both. We have been intimately acquainted, and still are, with parties visited in both ways, both universally and individually; that is, as religious characters, and mere sorcerers, wizards, and fortune-tellers, and we have looked upon the phenomena attending their peculiar visitations without the smallest sensation of fear, or the slightest inclination to be guided by the responses which they gave to our enquiries; whilst, at the same time, we frankly own before the public, that we feel thoroughly convinced, after the minutest enquiry, that their craft is not all a human, but partly a divine imposition. But it is an imposition blended with remarkable truths. If it were not blended with truth, how could it be kept up? And, if it were not an imposition, it would supersede the use of our reasoning faculties, and destroy the foresight, the industry, and the ingenuity of the human race.

Our readers will discover, from the above remarks, that our faith is not superstitious; it does not nullify the judgment, neither does it encourage the study of such arts to discover the destiny of individuals, for their predictions are deceitful; but it encourages the study of them as branches of science which ought to be understood, and must be understood, in order to demonstrate the harmony of the universe, and the reality of a spiritual universal agent, who guides unseen the complicated machinery of Nature, and condescends to meddle with the little petty concerns of individuals and insects, as well as to guide the planets in their courses, and to keep up the light of the everlasting suns. That this spiritual power is a MYSTIC; speaks a language different from man; a language of tropes, metaphors, hieroglyphs, and emblems so exceedingly intricate that man will to all eternity find enough of employment in studying, and yet always be gratified by a sensible progress in acquiring a knowledge of it.

We shall continue this subject next week.

PHRENOLOGY AND PHYSIOGNOMY.

TO THE EDITOR OF THE SHEPHERD.

SIR,—It is a common remark among phrenologists, and one, too, which agrees with my individual experience, that opponents of phrenology are, generally speaking, ignorant of its very fundamental principles. I also

find some, who, with a smattering knowledge of its principles, are entirely ignorant of the state or condition in which the science at present is, and who, therefore, from using equivocal language, or otherwise misrepresenting it, make a false impression of its condition upon the minds of those equally unacquainted with it. Among this latter description, Sir, if my impression be correct that you are the author of a short article upon "phrenology" in last week's *Shepherd*, I am sorry to be compelled to enumerate even yourself.

You sneer at "bumpology," a name given to it by opponents of the former description; but because you either can not or will not, you make no distinction between phrenology as it is, and what ignorance makes it. Hence you speculate upon what it ought to be; and the result of your speculations is, merely, that it ought to be what it really is. I am much more willing to attribute this to ignorance than design on your part. You require no such supports to establish your intellectual character.

It is not by any modern addition which it has received, that phrenology is in this advanced position either, but by one of the latest works of Dr. Spurzheim, one of its founders. To establish my point, then, that physiognomy is, at present, admitted as part of phrenology, I will give a quotation from the Doctor's work, to which I have referred, which, besides bearing me out, will be found to be, of itself, intrinsically valuable. But, as it is only from a review of it that I can do this, your readers will make due allowance if the remarks be not so pointed to the present case, as from the work itself they might be made.

"The word physiognomy," says Dr. Spurzheim, "considered etymologically, signifies the knowledge of nature at large. Sometimes, however, it is employed to designate the configuration, and, even more commonly, the expression of the countenance. In another sense, again, it is used to imply a knowledge of the external signs, which proclaim internal qualities.

"Entire nature," he observes, "may be comprehended in the study of physiognomy; the husbandman judges by the aspect of the soil whether it be rich or poor; celerity is visible in the configuration of the roe, sluggishness in that of the bear; the muscular configuration of Hercules indicates strength; the elegant form of Hebe is expressive of grace; finally, the affections and intellectual characters of man, in the healthy and diseased states, are proclaimed by physiognomical signs. In looking round us we distinguish, as by intuition, the benevolent, candid, and modest individual from another who is cruel, artful, or haughty.

"Is it not, then, astonishing that this science should consist of mere isolated observations unreduced to principle? Every one is conscious of the various impressions made on him by others, but no one can in anywise account for them.

"The question then is, whether or not it be possible, by observation and induction, to determine physiognomical signs, in regard to the fundamental powers of the mind? Lavater, who wrote fragments on physiognomy, and who styles himself a fragment of a physiognomist, maintains, nevertheless, that physiognomy exists as a true science. With that opinion of Lavater I entirely agree."

Dr. S. distinguishes between signs dependent on configuration and organic constitution, and those emanating from gestures and motions. "Signs of the first kind proclaim innate dispositions and capacities of action. They constitute the study of *physiognomy*, strictly speak-

ing. Signs of the same kind, again, indicate powers in action, and constitute what is called *pathognomy*, or natural language. The latter description of signs is not included in the plan of this work; it will be examined in a separate treatise: at present I treat of the physiognomical signs alone.

"Lavater declares that 'the same face builds up every part; that such an eye supposes such a forehead and such a beard; in short, that each isolated part indicates the configuration of the whole; as, for example, all parts are oval if the head present that form: hence that man is a unit, and that his size, form, colour, hair, nose, mouth, skin, ears, hands, feet, bones, muscles, arteries, veins, nerves, voice, affections, passions, &c., are all and ever in harmony with each other.'

"According to this hypothesis, an unsightly person ought to be the concomitant of an unenviable soul. The contrary of this, however, is observed every day. Æsop and Socrates are proofs that a fine form is not necessary to greatness of talent and to generosity of feeling. Indeed, Euripides, Plutarch, and Seneca, have long ago maintained the inaccuracy of such an opinion. Lavater himself was obliged to acknowledge that ungainly forms are sometimes combined with honesty of character, and that individuals, beautiful and well-proportioned, are occasionally deceitful. 'I have often seen,' says he, 'a contradiction between the solid and flexible parts; and every one may possess certain qualities without the respective signs.' He, therefore, admits exceptions, and his assertions contradict each other.

"This, however, is not the case in Nature; she makes no exceptions from her laws, and is never in contradiction with herself. Moreover, the individual parts of the body are not proportionate to each other. The head of Pericles was too large for his body; hence the ancient artists who made his bust thought it necessary to conceal this disproportion by covering the head with a helmet. On the other hand, small heads are often found on large bodies. There is occasionally a resemblance observable between the nose, mouth, or some other part of different individuals, whilst all the rest of their persons is extremely unlike. Now, as every part has its particular function, and as each part indicates its special dispositions, it is impossible to find in any one part physiognomical signs of the functions performed by any other part.

"As innumerable observations have proved that the different propensities, sentiments, and intellectual faculties of man are manifested by various parts of the brain, it follows that the physiognomical signs of these faculties are to be sought for in the size and organic constitution of the cerebral parts."—"It is necessary to determine individually the parts appropriated to, and the signs of, the special faculties, and also of the moral combinations of them which constitute determinate characters."

"In this, as in every other subject of human enquiry, it is important to distinguish between theory and practice. The true principles of a science may be established, but those who apply them may err."—"The adversaries of phrenology are sedulous, and ready enough in exposing the errors which Dr. Gall and I, and our disciples, have committed; but they carefully abstain from all mention of the numerous facts which we cite in support of our opinions. I do not conceive that phrenology has reached perfection now; nor do I hope that its application, even when perfect, will always be without error. I have frequently been obliged to rectify my judgment, but I always endeavour to profit by my mistakes. If the study of physiognomy is to be abandoned, because they who practise it have committed

errors, there is no art or science which should not for a like reason be given up. Is there any chemist, physician, general, artist, lawgiver, or priest, who can say that he has never erred in the practice of his profession?

"The object of the present publication, accordingly, is to teach both theory and practice; to exhibit a practical application of phrenology, which will at the same time illustrate and aid in proving the science." Dr. S. subdivides it into two sections. "In the first," says he, "I shall make observations on bodily configuration, and organic constitution generally, in connexion with adaptation to peculiar functions; on the difference in the heads and faces of individuals whose characters are opposed to each other; and on the difference between the heads of the sexes, and of different nations: in the second, I shall compare the characters of various individuals with the accompanying cerebral organization."

"In order to escape all cabalistic quibbling on the part of adversaries, I repeat once more—that the size of the brain is *not* the only condition which gives energy to its functions; but that the bodily constitution, and the exercise, and the mutual influence of the faculties, also modify their activity. I repeat, too, that I make a distinction between innate dispositions and the activity they possess, and also between signs of dispositions and signs of their activity."—*Review of Spurzheim's Phrenology in connexion with the study of Physiognomy.*

The first section treats of "the physiognomical signs of the body, face, and head in general." Chapter I. is on the Physiognomical Signs of the Body, and concludes with a specification of Physiognomical Signs of the Body of the Sexes. Chapter II. treats of the Physiognomical Signs of the Face, in which he notices the difference of the faces of the sexes, and then treats of national faces; and chapter III. on the Physiological Signs of the whole Head, in which he treats of heads of the sexes, and of national heads. Should any of your readers like to see this work, which, the reviewer says, is, of all the Doctor's works, likely to be the most popular, it was published by Treuttel, Wurtz, and Ritcher, London.

DISSEMINATOR.

[If Disseminator examines our article again, he will find that Dr. Spurzheim and we are of the same mind; but his present self-called disciples have sadly apostatized from their master's doctrine.—*Ed.*]

POISONOUS HONEY.—Xenophon says, that the army of the ten thousand Greeks experienced a temporary madness by eating of the honey of Trebisonde. The truth of this has been ascertained by Keith Abbott, Esq., who says that in small quantities it causes headache and vomiting, and in greater quantities destroys all sense and power of motion. It is supposed to be from the flowers of the Azalea Pontica that the bees extract this honey.

VIRTUES OF CHAMOMILE.—In the *Irish Gardener's Magazine* it is said not only that decoctions of the leaves dried and powdered of the common chamomile will destroy insects, but that "nothing contributes so much to the health of a garden as a number of chamomile plants dispersed through it. No green-house or hot-house should be without chamomile in a green or a dried state—either the stalks or the flower will answer. It is a singular fact that if a plant is drooping, and apparently dying, in nine cases out of ten it will recover, if you place a plant of chamomile near it."

CORRESPONDENTS.

Eliza will find an answer to the first portion of her letter in our last week's Correspondence. She seems to lay

great stress upon Christ's words, "the Devil was a liar from the beginning." So he was, and so he is, and who is not? Even God himself, in making his covenant with David, swore by his holiness that he would not lie unto David, as if he was in the habit of lying to other people; and what is lying, but saying one thing and meaning another? which is in fact the true characteristic of prophecy and revelation. Yet God is true, ultimately, in the universal sense of these revelations, although he is false in the individual or partial sense. He is in fact every thing. It is folly to divest him of any conceivable attribute.

G. H. is very complimentary, but our modesty will scarcely suffer us to publish so much of our own praises. We admire the spirit of both pieces, but we would recommend him as a friend to devote his attention more to prose than rhyme. It requires a peculiarly active, rambling, lively mind to make a successful poet, and very few indeed are possessed of this gift, nor is it any disparagement to a man's intellectual character that he is not.

It is impossible for us to please all the ladies; we must offend some, and by so doing we are sure to please others.

Infidelity is such an unsystematic, unintelligible negative, that it is only fit for man in that state of transition when he casts off the errors of vulgar superstition, but has not yet discovered the first principles of truth. If L. P. imagines that there is a system, or any thing intelligible in it, we should be happy to be favoured with his views of Nature. We have not the least doubt but in the course of time the very name of infidel will be extinct, except in the catalogue of the fools of the old world. The word only conveys to our mind the idea of an intellectual vacuum, wilderness, or chaos. It requires no more knowledge to make an infidel than to make a fanatic; he has only to swear and laugh at all priestcraft, damn the Bible as an invention of knaves or monks, and say No, no, to every thing that treats of God or a future state. When he has advanced thus far, he is what some call a "liberal"—quite finished.

C. L. has been deferred till next week.

P. Q. is right; all parties must fritter away until one is formed upon universal principles, which embrace the past, the present, and the future; notwithstanding even when they receive their death-blow, they leave a remnant behind who adhere to the sectarian principle as its delegate and representative. This law prevails both amongst believers and infidels.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 25th inst., at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Tringate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Braddy, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 40.]

SATURDAY, MAY 30, 1835.

[Price 1d.]

SYSTEM OF NATURE.

THERE are evidently three divisions of general Nature, to which, in common parlance, we give the names of physical, intellectual, and moral. Whether these terms be suitable or not, we shall not enquire, but take them as we find them, without burdening ourselves and our readers with words with which they are not familiar.

Corresponding to these three, our mystic philosophers, or those who converse chiefly with the inward phenomena of feeling, and less with the outward phenomena of science, have invented another trinity, which they call the natural, the spiritual, and the divine, or celestial.

This latter triad is exactly analogous to the first; the order of progression, and the relations of each to the others, are precisely the same; only a mystic most probably insists upon a more exalted and refined acceptation of his word *divine* than he will concede to the word *moral*. Very well, let him have it. The one is the original, the other is the representative. He probably also insists upon the same claim to superiority in behalf of the word spiritual over intellectual. Let him have it. The intellectual is the application of the energies of the mind to science, or the study of external nature; the spiritual, to the internal nature. The divine and the moral *feelings* are not energies at all; they are mere sensations, sympathies, loves; the repose of the mind or the soul in a state of conscious happiness and equilibrium.

Corresponding to those we have three terms expressive of a triple alliance in individual nature, namely, body, spirit, soul. The body is the grosser or material principle; the spirit, the active, thinking, working principle; and the soul, the moral, or social, or divine principle. There is the same distinction between these latter three as between the former three; yet they all blend so imperceptibly together as to form a trinity in unity.

What we perceive in the individual man we must also discover in the universal man, as well as in universal Nature, for man is the image of the whole. This brings forth the divine trinity, namely, the Father, the Logos, the Soul, or Holy Ghost, commonly called the Spirit; all the three are spirit, only the one works in the natural, that is, merely physical world; the other, the word or wisdom, in the doctrinal or scientific world; and the third in the moral world.

The first and the last are the two extremes, perfect antipodes to each other, both enjoying a state of uninterrupted repose. What can be more tranquil than physical Nature, and her everlasting and unchangeable laws? Nothing, except the divine nature that sleeps in her

bosom, in an ecstasy of imperturbable, everlasting love. But between them both there is an infinite distinction, for the one is the tangible, the external, and the sensual; and the other the intangible, internal, and (but it is an imperfect word) moral.

In the spirit which goes between and links these two together, all the activity lies; he is the agent; he carries on the progress of those minds which are destined to move between the two extremes of physical on the one hand, and moral on the other.

The physical is the starting point; the material, sensual, selfish, unsocial; there man begins to live, both as a species and an individual; a poor sensualist, ignorant, unsocial, devilish. The spirit begins his operations immediately, and carries him on through the different stages as well as all the minor details of experience. These are threefold, according to the threefold division of Nature.

The first stage is physical or material; hence we find all the ancient prophets promised only temporal blessings to the faithful; dominion over the nations, plenty of corn and wine, and all the other luxuries of sense. This was the law; not a word about spirituals. Then came the Son, that is, the representative, or bodily type of the Logos, or thinking spirit of Nature, and he spiritualized the law into a mere ghost, like himself; and since that, it is even accounted a sin to pray for temporal good things, as eating and drinking, although the elect have no objection to take them on the sly when they can get them. And now we want the moral, or divine, when men will act from the very soul of religion, exemplify it in the sympathies and affections of the heart, and not as hitherto in the wranglings and disputations of the spirit and the head. This latter stage may with strict propriety be called divine—the reign of *God*, in the highest or most exalted sense of the word; as the other two were the reign of God in the lowest or grossest sense of the word, that is, the Devil.

It is evident from the above analysis that the Devil is twofold, and God onefold, and the two combined, threefold, or universal being; and it is also evident that the spirit, or middle-man, or mediator, is a man of both sides; that he acts first with the physical, and gradually progresses to the moral; in other words, two characters, that is, two natures; therefore we are told the Son of God has two natures, *human* (physical) and divine; that he comes twice, first in his physical character to die, and second in his divine character to live; consequently at his first coming he is *evil* in the effects of his mission, (not to send peace, but a sword;) and at his second coming

good, not to send a sword, but peace. This is a scientific and philosophical reason for the evil of first Christianity, and shows also the necessity of its utter annihilation.

But how is it annihilated? It must be annihilated in a manner analogous to the annihilation of Jewism, not by destruction of its elements, but by its sublimation or moralization. As Christianity spiritualized the law, so universalism must now moralize Christianity, by divesting it of its injustice, cruelty, and absurdity, but at the same time preserving sacred its original basis; for nothing in the past can be lost or cast aside which Providence has preserved for the tuition of his creatures.

But why is the Devil twofold? What special reason is there for making him so? Because he is the personification of imperfection, or evil, or action; for perfection does not act; it is eternal repose. Now action always presupposes passion, or a subject to act upon; consequently the Devil is the agent and patient, or the male and female in separation. God is the male and female in union, therefore the Jewish tabernacle was ordered thus:

three squares in all; two for the holy place, and one for the holy of holies, in which the shekinah dwelt, and into which none but the high-priest entered. This is the simplest model of nature which it is possible to draw, unless, perhaps, it be the following:

•
•

The first dot represents the universal God, the all in all; the two lower, the created or representative God, with the two extremes in a state of separation, or action. In the first, the two extremes reside in a state of neutrality, unity, or repose. In the second they are divided. This division creates action, and action creates evil progressing towards good. Therefore, as long as man was a unity he could quarrel with no one, he was a universal philanthropist and socialist; but as soon as the woman was taken out of him it was otherwise; this simple act of division brought sin into the world, for then there were two interests instead of one, and as they multiplied it became worse and worse, and must do so until they discover a universal principle or sympathy, by which the species may be united as one man. This is the redemption of man, and can only be effected by the divine or the moral principle. When this is done in a comparative sense, (it can never be perfectly accomplished,) Satan is transformed into an angel of light, yet still Satan, for he is divided, and must always be quarrelling more or less with his component parts; but he ceases to go by the name of Satan when he has passed the physical department and entered the moral; that is, when he has put an end to war and violence, and all other systems of physical coercion, and established a moral and intellectual form of government for mankind. This is our millennium.

We are now induced to offer a few observations upon

another threefold division, analogous to the former three, and more familiar to the public mind, namely, politics, science, religion. These three words must be explained. The first corresponds to industry, eating, and drinking, in individual life; the second to an investigation of the general phenomena and laws of external nature; the third to the culture of the soul, or the affections and passions. The two first are external in their sphere of operation, the latter is internal in an especial sense, and therefore called divine or central. All the three are internal or spiritual in a certain degree; industry is an impulse of the mind and affections; and study is the same; but their sphere is external, inasmuch as they deal with the outer world in providing materials for ingenuity and reflection to work upon; the religious culture is a polishing of the inward man, an adaptation of the feelings for every variety of impression to which they may be subjected.

Now this latter object is the great end and consummation of all human progress. What are we without this moral or religious polish but brutes or savages? Industry, wealth, science, are of no use to man, unless his affections are cultivated, and brought in subjection to social and universal principles. It is not science that determines the worth of a man, nor is it wealth or political power. Many of the most illiterate, forlorn, and destitute specimens of humanity have finer feelings, deeper and more intense sympathies, with the joys and sufferings of their fellow-creatures, than those who have experienced all the cultivation which wealth, power, education, and fine scientific talents could bestow upon them; for all those advantages avail them but little if they want a heart. This is the throne of true religion—a science which never yet has been taught in the world.

Some of our readers may ask if what is taught in the churches and chapels be not religion? We answer, No; it is merely a theory of science; it is doctrine, not religion. Religion cannot be taught: the man who presumes to teach religion is a fool. Religion is *felt*, religion is *practised*; but it is incommunicable. The State and Church are the Devil—the two-fold division of physical and spiritual: the divine, moral, or religious, is to come; and this constitutes a new church, in which mere science shall be subordinate to the social principle of love, and men shall be governed more by mercy than judgment. “Mercy is my darling attribute; judgment is my strange work.”

Neither the political nor the scientific principle can ever gather mankind; because they want the very essence of the social feeling which belongs to the religious department. Nor can the religious feeling alone, without the other two as subordinate agents, succeed in effecting this great object; because it is impossible that the religious principle of social love can inhabit the bosoms of those who are not politically and doctrinally united in the elementary principles of government and natural knowledge.

But some may ask how is it necessary that mankind should concern themselves with ideas of God, Providence, universal life, intelligence, &c., in order to associate for mutual benefit? Because those are universal and uniting principles; and no universal end can ever be accom-

plished without universal means. The settlement of all those disputations questions which separate the affections and moral sentiments of men, is effected by these universal principles of God, and by these only; they are the consummation of the progress of mind, and the beginning of the new era of social love. How is it possible to find any other universal principle but God? However, there is no harm in making an attempt at union without such universal principles. Fools must learn by experience only.

When these universal principles are received and cultivated, they carry supreme authority, the authority of a voice from heaven, along with them. And this is an essential requisite for union; a republican mass of conflicting opinions, propelling the rulers of the country in a thousand different directions, and confounding their minds by an infinite variety of motives and stimulants, is a most disorderly system of government. What is the cause of this confusion, but the want of a system of universalism, which begins with the individual unity, and ends with the social unity? Neither Radicals, Infidels, Liberals, nor Christians, teach this; because they do not know it; they have only an undefined, unintelligible set of ideas about education, liberality, toleration, &c. But education, without universal principles, would only aggravate the evils of life; and liberality, without universal principles, is impossible; and toleration, without liberality, is a word without a meaning. There is no possibility of social union upon any other basis than that of a principle of universal life, intelligence, and love; and that principle is God.

THE SHEPHERD.

ON MENTAL DISEASES.

LETTER IX.

O glücklich wer noch hoffen kann
Aus diesem meer des Irthums auf zu tauchen!
Was man nicht weis, das eben brauchte man,
Und was man weis kann man nicht brauchen.—GOETHE.

He is happy who has not lost the hope of escaping from the ocean of errors! What we do not know, is really useful; that which we know, is useless.

A most curious case of hallucination came under my treatment a few years ago—a case which proves the immense power of imagination, both in producing and curing diseases.

I was once called from my breakfast to visit a parson, who, as reported, was labouring under a fit of rage. I mounted the horse, and rode to the parsonage, which was a few miles from my residence. On entering the room, I found the parson, a well-bred and highly-talented gentleman, bound with cords on his bed, foaming and swearing. Four robust men were watching him. As soon as he caught sight of me, his physiognomy cheered up. I approached him gently, and asked him what the matter was? "Sir," said he, pointing to the right side of his forehead, "you see what I have. This enormous fungus causes me terrible pains; I sent for the surgeon, and that infamous rascal says that I am mad; and, instead of removing the fungus, he attempted to bleed me; but I have paid him as he deserved. The fellow, how-

ever, not satisfied with this, goes abroad, says to every one that I am raving mad, and bribes those ruffians to bind me down like a mad dog.

"What," answered I, immediately, "was the surgeon in his mind not to see that enormous fungus? And you, fellows, why lay hands upon your parson? Be gone immediately, and leave me alone with him!" The poor devils at first would reply, but upon my serious admonition went away; I cut the cords, and appeased him so far as to make him keep his bed quietly.

"You must keep your bed, and be quiet," said I, "and I promise to have you cured in twenty-four hours; but I must send to the town for an able operator." In the meanwhile I ordered dome cooling draughts, a foot-bath, and some fomentations to be applied to the imaginary fungus.

The next morning the surgeon arrived with his instruments, and performed a mock operation; and, strange to say, not only did the reverend gentleman feel all the pains of a real one, but fell into a state of debility, as if he had sustained a great loss of blood. After the operation I applied a blister to the affected part, which I kept open for about three weeks. By degrees he recovered, and has ever since been in the firm belief that I have cured him of the most painful deformity. Now, I ask, as this man was intelligent and rational in all respects, but complained of a visible and tangible disease, which did nowhere exist except in his fancy, of what use would have been the help of the pharmacopoeia? The imagination was sick, and imagination alone could cure him.

THE ALPINE PHILOSOPHER.

WITCHCRAFT, &c.

(Concluded from our last.)

THERE are peculiar and specific organizations for every department of mental and industrial agency. There are organizations which are designed for mechanical, others for scientific, literary, or political pursuits; others who are mystics by original constitution, and led to the study of the internal and invisible phenomena of mind by an irresistible necessity. Others again are remarkable for their sympathetic feelings, their nervous irritability, their visionary and somnambule tendencies, &c. In fine, there is an infinite variety of human character, which will one day be scientifically arranged under different generic or specific names, according to the phenomena which each presents. These varieties are essentially distinct. Each has its own circle of thought and action. The man of science is quite at home amid the intricacies of algebraic calculi and mathematical or experimental analyses; but not more so than the Southcottian visionary, who is daily conversing with angels and spirits; or the more sober and liberal-minded peeper, who, without presuming to reason about cause and effect, God, angel, Devil, moral right and wrong, or any thing else, but the purest individualities and personalities of fortune-telling, strains her eye-sight "from morn till dewy eve" contemplating and describing the vision of the crystal, which the wizard or herself has charged by incantation for her numerous customers.

"What power is it," we once asked a famous cry-

stal seer, "what power is it which creates the vision in the crystal?" "The power of the words," she simply replied. "Words! how can the words do it? Words are nothing." "I don't know," she said, "but I can see nothing unless the words are pronounced." But the wizard himself, her husband, who married her for her gift, always invoked the *power* of Jesus Christ, Michael, and all the angels of God. He averred that he himself never could see any thing in the glass. The reason was, in the words of the ancients, "he was not a seer." Some of our readers will, no doubt, say there was nothing to be seen. These are very wise readers, and "liberals," without doubt. They have finished their education, and have nothing more to learn. We ourselves cannot say so, but we are by no means anxious to make our readers receive any opinion from us which is not demonstrative. If they want such knowledge, let them enquire patiently and candidly for themselves, and not be directed in their estimates of Nature's ways of working by a puritanic or an infidel creed, which are both alike absurd.

But why should these things cease in an age of science? They have not ceased in reality; they have only ceased to be so frequently consulted and talked of, because it is discovered that they are mystical or deceptive, and cannot be followed as a rule of life, for which they were once consulted, like the oracles of the ancients. The phenomena still exist. All the spiritual materiel for a shrine as famous, as true, and as impenetrable as that of Apollo himself, is still in being. But the religious sense of the public,* and political policy of governments in Christendom have always persecuted these phenomena, according to the injunctions of Moses and the prophets, who belong to the other department of revelation, namely, the religious or universal, though hitherto it has been universal only in name.

There can be no doubt that charms, amulets, pentacles, and all other instruments of spiritual agency, have always been in use in all ages, and in all countries. Even to this day, when faith in these individualities is fast decaying, there is not a parish in England where the practice is not daily followed in the healing of diseases. We not long ago met with a respectable medical man from a central county in England, who told us that he frequently employed charms to soothe his patients, and he confessed that he considered them as good medicines in many complaints as he could administer. This, no doubt, depends on the faith of the patient, and he is a wise man whose liberal feelings permit him to make use of any means whatsoever which are calculated to produce that healthy and contented repose and confidence of mind, which are always the best assistants to a medical practitioner. A "liberal," of course, would disdain to do such a thing. Nothing but pure materialism, either a strong purge or a gentle purge, would satisfy his senses. Well, materialism is also good in its place, and so is witchcraft occasionally.

* It is not the religious world, vulgarly so called, nor the infidel world, who consult such oracles, but an intermediate class, who do not rightly know what they are, and probably for that very reason are the wisest of the three. The religious world abhor such things, and infidels despise them.

When a child has hurt his finger, he cries, and holds it out to "mamma," and mamma blows upon it, and says a kind word, and all is over. If mamma won't blow, the baby still cries with his sore finger. Behold the effect of a charm! The blowing is purely a sympathetic remedy, but it is a universal remedy all the world over. Savages do the same, and even liberals blow the fingers of their little murmuring patients.

But what say we to raising the Devil, the black art, and the higher order of enchantments? We shall get over those subjects too with our universal solvent—*faith*. Those things are rarities, and ever have been rarities, and we leave them in the hands of those who have seen and experienced them. But we do not consider it at all unlikely that Nature should occasionally raise up extraordinary and master minds in such arts as well as in poetry, painting, eloquence, and science; minds which eclipse all other practitioners, and leave an impression of wonder and reverence, or fear, behind them. That such characters have occasionally been raised up to preserve the spiritual principle in being, we doubt not; but for every one of those sons of genius there have been a thousand impostors, or unskilful though honest enough pretenders, who have put a check upon the faith of the public, and prevented the injury which the human mind would have sustained from such superhuman and irrational agencies.

Thus we are both believers and disbelievers in this as well as in every other metaphysical or mystical subject, and we consider it necessary to remove all the penal laws which now hang over the heads of those who practise these occult and sympathetic arts. Give them all free scope, and let them find their own level. Truth will always prevail ultimately; error can only maintain itself by inquisitions, gaolers, fines, and stripes; and even these at length get tired of its service, and rebel against it. If a fortune-teller or wizard should be guilty of evident fraud or extortion, let him or her be treated when convicted as a common felon; but the mere fact of receiving money for the oracular responses of their peculiar arts, is as innocent and honest a way of making a living as that of the King or the Lord Chancellor himself. It is a mutual bargain between two parties, and if both are satisfied, who has a right to interfere? We hope to see the witches emancipated, as soon as the Jews have got their shackles taken off; and then we have little doubt that witchcraft will be reformed and universally practised, and all human society will be studded with charms. As for the Devil, we are not the least afraid of him. He will then do no harm when he rises. He is merely a servant, and will work evil or good, according to the previous arrangements we have made in the social circle. He is a serpent, and carries the cure for his own sting.

TO THE EXTERNAL CHRISTIANS.

In the ordinary business of life he would not be deemed to act rationally, who, desirous of arriving at a distant place, and having a written record of the adventures of some who had been there, stayed employing all his efforts in reading over and over again that record, commenting on it, and repeating the words of it to every neighbour.

We may be satisfied also, that he would no more study the record for information, if he had at length set out and arrived at the desired place.

Not more wisely, however, does the religionist or moralist act, who, having the desire to arrive at the consciousness of eternal goodness and truth, employs all his mental energies in reading and commenting on the representations of those who have been in that state; thereby being less likely to attain his object than if he had never seen such representations. We may be satisfied also that he who has arrived thereat will no longer look to such records for information, or appeal to them as an authority or a guide to others.

On the contrary, he would constantly warn the seekers of goodness and truth from such shadows; that their mental wants, no longer finding a false satisfaction in results apparently or logically correct, though leading only to discord, may recur to the source which alone can neutralize those wants, by a real and full fruition.

If this direct recurrence to the universal and eternal source of goodness and truth be made, not through the narrow channel of logical proof, but by a self-existent state, harmonizing by submission to its influence in the human creature; not by a blind faith in shadows, but by a self-conscious feeling of its reality, more perfect than physical existence impresses; the proselyting spirit will depart; for the truth will be known to be the upholder of men, and not men the upholders of truth. Forms, and creeds, and doctrines, will be deserted; for the universal and eternal will be felt to be without form, or bounds, or systems; and such recurrence will display itself, not by offensive dogmatism, but by a never-failing, enlightened benevolence; not by verbal quotations of outward shadows of truth, but by newness and originality adapted to every occasion; not by an internal idolatry of human excellence, but by a living reliance on the one perennial source of all excellence within us. C. L.

May 18th, 1835.

[A man cannot be a universalist who does not connect the past with the present and the future, and show the embryo of the adult in the immature figure of the strippling. Notwithstanding, our correspondent is so far right that Nature or Truth is more clearly revealed in the present than in the past. The present is the active mood of the Trinity; the past and the future are both passive.—Ed.]

TO THE ALPINE PHILOSOPHER.

GOOD SIR,—I like your temper from my soul;
It is the negative of my own mood,
But much more pungent; like a living coal
It purifies the dross from every feud.
Good humour is ill-nature's antipole.
My wish is, you may still be spared for good.

* * * * *
You tell me I accuse you (I do not)
Of quackery. I'll not accuse you, Sir,
Of misconstruction, or design to blot
My character or motives; or infer
That you would brand me as a drivelling sot,
Because I gave my Pegasus the spur:

I've no objection to the mathematics;
But are they *understood* in workmen's attics?

Had I the means, I'd strive for a degree
At Oxford or at Cambridge, "eat my commons:"
A "freshman" once at university,
I'd quickly swallow all the Greeks and Romans.
To square the circle next my aim should be;
My application, sure, would yield to no man's;
Sines, arcs, and angles, then no more abstruse,
I'd give you—what? a thought's hypotheruse.

You are profess'd the patron of the sect;
At least, a fellow of that same society,*
Whose unpretending object's to select
The gems of science from its vast variety.
I would not treat the Tuscan with neglect,
Though filling to repletion or satiety;
But, greedy as the horse-leech, till my core
Should burst, I'd still exclaim, Oh! give me more!

When you suppose you reason "*à priori*,"
All are familiar with the "first equation;"
And prove yourself, as 'twere, to be a Tory,
Too proud to stoop below your own high station;—
Your signs are cross-bones, or "*memento mori*,"
To men who have but little education:
Though you may understand them, do the throng
Of labouring readers? To them I belong.

'Tis true you are always ready to explain
And answer any question that is put;
But many have that confidence to gain.
The fear they might become the witling's butt,
Curbs in their thoughts as firmly as a chain
Could bind their hands. Though you may cry tut!
tut!

I've known the time I trembled till my face
Has glow'd with perspiration and disgrace.

It seems that "acquisition" means "diffusion,"
According to your version, good Mécénas;
In fact, your weekly talented effusion
Betokens you a biped of that genus.
The *Shepherd* deals in science to profusion;
And here I'll let a secret out between us—
In that young *institute*, high Alpine College,
There are some heads not overstock'd with knowledge.

I call it their misfortune, *not* their fault!
And if you toil'd for sixteen hours per day,
Or even twelve, to earn a little salt
To season your potatoes, tell me, pray,
Would you have vigour left for the assault
On Locke or Euclid? Come, be candid, say!
Or could you purchase works whose costly price
Shut up your purse-strings? There! I've thrust you
twice!

And *terce* and *carle*, I still could thrust and thrust,
In the defence of my much-injured class;
How sad their fate, whose sweat must bring the crust,
With little leisure knowledge to amass!
Worn with fatigue, and parch'd with heat and dust,
Their minds are brutalized, and scarce can pass
Beyond the merest animal enjoyment,
When night gives respite to the slave's employment.

But time advances, and the human mind
Flies with it like a ray on the horizon;
The bright precursor of a day more kind
Than this dull world has ever yet set eyes on.

* The Society for the Acquisition of Knowledge.

The mists of Superstition still *must* blind;
 And Reason lingers yet a while in prison;
 But when she shall escape the monster—Oh!
 Aid us as now to give the final blow!

The sun of Arno hail'd your infancy;
 The land of Petrarch rear'd your infant form;
 Calm as your climate, cloudless as its sky,
 May you withstand unmoved the slanderer's storm!
 The sense of right alone can well defy
 The shafts of hate, and keep the bosom warm:
 Be that your safeguard, then; "*justitia fiat*;"
 The dove's secure, though famish'd vultures fly at.

Man is a pendulum, (and life's a jest),
 For ever swinging to each wide extreme;
 A riddle or conundrum at the best;
 A rainbow in a shower, a waking dream;
 A gay cameleon in "*motley*" dress'd;
 A blessing or a curse, as it may seem;
 He is, in short (such is the poet's notion),
 The *BEAU IDEAL* of perpetual motion;

For ever changing, and yet still the same.
 With all his knowledge, does he know himself?
 A mere ephemera in quest of fame;
 Though very generous, a sordid elf.
 What his pursuits? a bubble or a name;
 Ambition, glory, love, promotion, pelf.
 Then let us laugh! what reck's it you or me?
 True wisdom lies in living tranquilly.

My *hint* was never meant to give offence,
 And I am sorry if I have offended;
 I can't believe it—you have too much sense—
 And know how far your doctrine has extended.
 To seem alarm'd would be a vain pretence;
 'Tis a bad cause that cannot be defended;
 But 'gainst my wit if you would strike the docket,
 Beware! my "*squib*" may turn into a rocket!

There's my apology! Will that suffice?
 The "*Vale of Chur*" re-echoes, Yes, it will!
 Give here your hand; but pray don't magnetize,
 Or "*burn*" me to a heap, with *wizard* skill!
 You see I'm honest with *telluric* eyes.
 Alas! I fear—what means this deadly chill?
 I'll give you satisfaction when we meet,—
 If not at "*Philippi*,"—in *Castle-street*!

Adieu! dear *Alpus*—*Alpus*, yet adieu!
 And should the god of *mercies* please to send
 A fit of sickness—why, I'll send for you
 To cure the malady, my health to mend;
 Then you may rub and scrub my system through,
 Or *batter* me until you make an end.
 Henceforth, though *Galen's* self would drench and
 physic us,
 His stuff shan't travel down the throat of

QUIZZICUS.

[The above is so very excellent as a whole, that we cannot reject it; but we fear almost any sort of personal addresses or correspondence, knowing well the inflammability of human nature, and the jealousy of its own reputation, to be such as often to lead to the suspicion of intended offences, where no offences were meant. As for ourselves, we mind satire, censure, and ridicule only so far as they give us a new idea; for the rest, we sit down contentedly, like uncle Toby, and whistle "*Lullabero*" over it. "We cannot help, it—it is the will of God. Thus it is."—Ed.]

ON THE LIBERTY OF THE PRESS.

A FREE press is made free by a free spirit.

A free spirit is made free by the free-making spirit.

The free-making spirit makes a free spirit by a natural, rational, and spiritual communication and conjunction.

So far as the spirit is united to the free-making spirit, it is a free spirit.

The free-making spirit sustains the free spirit and the free press.

A free press without a free spirit is impossible.

And a free spirit without elevation, communication, and conjunction with the free-making spirit, is impossible.

As it is not the press that makes or supports the spirit, neither is it the press that enlightens the spirit.

A free spirit uses a free press to represent the free-making spirit in all its originality.

As the free spirit has its origin in the free-making spirit, so must the free press have its origin in the same.

It is not possible to suppose a free press without a free spirit, made free by communication and conjunction with the free-making spirit.

As a free spirit proceeds from the free-making spirit, so the free press proceeds from both, in their conjoined energies.

The natural man may say what he will about the free press. The press only can be used freely when the natural man is made spiritual by a free and full communication and conjunction with the free-making spirit.

Man is the organ through which the free-making spirit makes the press free.

Such as rely on some hoped-for symmetrical external arrangements to produce an internal right, might be reminded that an outward existence is the unfailing reflexion of internal state, and no more. It were as absurd to attempt altering the human complexion by altering the mirror which reflects it, as to expect an improved state of human society by an improved external state of the press, which only records the same.

THE SEER OF PREVORST.

MY DEAR SHEPHERD,—Your readers, I imagine, will no longer be shocked at the following summary description of a work which has lately appeared in Germany, entitled "*The Seer of Prevorst; or Revelations concerning the Inward Life of Man, and the intercourse of Spirits with our World.*" Edited by *Justinus Kerner*, a physician of *Weinsberg*: 1832. The work forms two pretty considerable octavo volumes; and consists almost entirely of the diary of a somnambulist, kept during the last year of her painful life. Throughout this account an air of candour prevails, which defies all but the suspicion of the fanatical sceptic. The testimony of such men as *Eschenmayer*, *Schubert*, and *Görres*, is frequently appealed to; the names of known visitors and neighbours are cited as evidences of facts familiar to them; and, in short, the reception, by the learned in Germany, of the statements and views contained in these "*Revelations*," is such that we must either admit them to be true, explain them how we will, or suppose that the philosophers and physicians of that country have entered into a conspiracy to darken the human understanding, and to blot out the sun of truth.

I shall not retrace the sufferings of this poor woman, who, from her earliest days, evinced that peculiar temperament which forms the natural somnambulist. After years of intense bodily anguish, heightened by ill treatment, she was taken on the 25th November, 1826, to Weinsberg, to be placed under Kerner's care. She was then more dead than alive, her existence being only supported by giving her a spoonful of broth every three or four minutes, which she often could not swallow, but which caused a fainting fit if withheld. Against Dr. K.'s will, at her own suggestion, he at last had recourse to magnetism. After the first seven streaks, she fell into somnambulism; and then, of her own accord, declared that, after seven days' treatment, she would be in a way of recovery. This, in fact, proved true: subsequent events, however, threw her back again into that *sleep-life*, which had become her second nature. For the rest of her days, she existed in a world entirely beyond the ken of the ordinary senses. The stages of her visionary existence thenceforward divided themselves into four, thus enumerated:—

1st. That, in which she usually was, when she *seemed* waking; but it was no such thing, as appeared by her subsequent unconsciousness of all that had happened. It was the first degree of "interior life." When in the "clear-sight," she declared that many men are constantly in this first stage of magnetic being without being aware of it.

2nd. That of the magnetic dreaming. In this state, according to her, many are spell-bound, as it were, whom the world deems mad.

3rd. That, which is called by Kerner the half-waking state. It was chiefly distinguishable by this—that she wrote and spoke in it an *unknown tongue*! the language of her inward, as she called it, and of which many samples are given in the work [here it will suffice to say, that its characters and sounds resemble the oriental letters and words]. She maintained that it was the native speech of the soul, spoken by all who had penetrated into the same circle of the interior. In her waking and dreaming states she knew nothing of it.

4th. That of somnambulism, in which she went deep into the inmost sphere of vision, in which she saw the past, the present, and the future, communed with souls and spirits, and saw their interference in our sublimary sphere.

This is her explanation, while in somnambulism, of these two last states:—"In the half-waking state I think with my smaller brain (cerebellum) only; of the larger I feel nothing; it then sleeps. In this state I can think more with my soul; it sees things clearer than in the waking state, and the spirit has a greater influence over it, greater than when I am awake. I feel him (the spirit) always a little out of the plexus. In the full sleep-waking (somnambulist) state, my spirit has the command; I feel my soul, too, but the spirit more. In *clear-sight* I think from my plexus with my spirit only."

Whatever we may think of this, we, who have heard so many debates about the size and stuff of the soul, the tenuity and density of the spirit, the form and substance of the invisible—I doubt that any of us could produce better reasons for our ontology than this poor somnambulist. She saw, but not with her eyes—she heard, but not with her ears—those beings of whom she spoke so confidently and so unfalteringly; nay, she made them visible and audible to others. I will relate the substance of Dr. Kerner's individual testimony of one instance of this:—he had said to her, "I have heard that the spirit manifests itself at times by noises; how can this happen,

and at what distance?" She answered, "It does, but space is not for the spirit; would you like to hear it?" He assented. Some nights afterwards, when he was in bed with his wife, several streets off from his patient, they heard above their heads a clear, hollow tap, and then, at intervals of a quarter of a minute, six more distinct taps. Kerner made himself sure that these noises, which he noted without fear or astonishment, could proceed from no collusion or coincidence, and the next morning said nothing about them even to his patient; nor did she speak of them till she was put into somnambulism, when she asked, in a seeming careless manner, whether he would wish to hear the spirit again.

This is one of many instances reported by a careful physician, who committed to his day-book all that happened in this singular case, for the perusal of the scientific world, and with a full consciousness that his reputation and veracity were at stake.

But what shall we say to the following? On the 2nd May, at nine o'clock, *Fran* H. again fell into magnetic sleep of an unusual kind, when she pronounced the words "Oh, God!" (She had had a vision acquainting her with the approaching death of her father.) At ten o'clock she, still in somnambulism, ejaculated, "God, thou hast him now in thy hands; he rests in peace with thee!" Next afternoon the following letter from Oberstenfeld, by Dr. Foehr, of Bottwar, was handed to Kerner:

"On my arrival at Oberstenfeld, I found Mr. W. (the father of the somnambulist) just dead. As I stood in the parlour, which adjoins a room in which the corpse lay, I heard very distinctly, about nine o'clock at night, the voice, as I thought, of the deceased, exclaim, 'Oh, God!' It was not until the third time that I heard this exclamation that I entered the room, imagining probably that Mr. W. was but seemingly dead. I examined him very particularly, but he was quite dead. I did not leave him for one hour."

On questioning the somnambulist, she stated that her soul, through grief for the old man, had, with her nerve-spirit, (the living ether in which the soul is clad), left her body on her exclaiming "O God!" and had manifested its presence by the corpse, with the same exclamation, which Dr. F. had heard.

A longer relation of such incidents, of which the book is full, would engross too much of one *Shepherd*, and very likely not satisfy the flock, whose appetites are not yet keen enough for this old superstitious food, as it will be deemed. It is little matter what name we give it—our business is with the truth of these facts. It will not do to revive an Index Expurgatorius for the infidels, in their turn, and to say that nothing shall be true but what they like. It is clear that the tide has changed in the land of Luther. That is not stranger than that the Ptolemaic system, which placed the earth in the centre, should give way to the Copernican, which placed the sun there. The phenomena will just go on in the same way, only we shall be enabled to calculate their movements better. From the allusions made to other physicians who have had patients in the same stage of clear-sight, it transpires that all the learned are familiarly acquainted, ocularly and orally, with similar revelations; that enquiries into things beyond the reach of mortal eye are as frequently subjected to the magnetic vision as we subject minute matter to the microscope; and that somnambulists are listened to concerning "that land from whose bourne no traveller returns," in the same way that we listen to accounts of a distant country, from one professing to have been there.

And judgment and liberality are no more necessarily warped in the one case than in the other.

It will require, however, an act of magnanimity, a real conquest over ourselves, to make the reparation to the so-styled impostors of old which these "revelations" show to be due. Not only do we find a justification of the Druids, the Fetishists, and the Pagan priests, in their prescription of amulets, rings, plants, divining rods, cabalistic numbers, and magic words; but the secret analogies of nature, on which these rude observances were founded, are laid open to us by the sensations and intuitions of the Seer of Prevorst. In vain will our pride murmur, and our courage quail before these admissions; they are now matters of historical evidence, and only to be sifted on the same grounds on which we sift other evidence. It will not shield us from conviction to adduce some theory of our own, that consigns all these mis-called miracles to the realm of the impossible. It will not meet the experience of others, to allege our systems of materialism, transcendentalism, or nominalism, as contradicting what they have felt, heard, and seen. God decreed it ever, that man should rely upon his fellow-man for the evidence of things unseen, such as the past, the distant; and nothing seems more inhuman than denying their actual sensations, upon no better grounds than our own prejudgment. It is as if the myope should study optics, to no better purpose than to prove to the long-sighted that it was impossible to see beyond his (the myope's) focal length.

On another occasion, I may probably give you extracts from this work; at present it is enough to have shown how the public mind in Germany is busied with those glimpses of a spirit-world which somnambulism has afforded to it.—I remain, &c. NEBULA.

THE RATTLESNAKE DISARMED BY THE LEAVES OF THE WHITE ASH.

DURING the summer months of 1801, I resided in the north-eastern part of the State of Ohio. Rattlesnakes were then very numerous in that region. I found the opinion universally prevalent among the inhabitants there, that the leaves of the white ash were highly offensive to the rattlesnake. Several persons of respectability assured me that the rattlesnake was never found on land where the white ash grows; that it was the uniform practice among hunters, as well as others, whose business led them to traverse the woods in the summer months, to stuff their shoes and boots, and frequently their pockets also, with white-ash leaves, as a preventive of the bite of the rattlesnake; and that they had never known or heard of any person being bitten who had used this precaution.

Some time in the month of August, I went with Mr. S. Kirtland and Dr. C. Dutton, then residing at Poland, to the Mahoning, for the purpose of shooting deer, at a place where they were in the habit of coming into the river, to feed on the moss attached to the stones in the shoal-water. We took our watch station on an elevated part of the bank, fifteen or twenty yards from the edge of the water. About an hour after we had commenced our watch, instead of a deer, we discovered a large rattlesnake, which, as it appeared, had left his den, in the rocks beneath us, and was slowly advancing across a smooth, narrow sand-beach towards the water. Upon hearing our voices, or for some other cause, he stopped, and lay stretched out with his head near the water. It occurred to me, that an opportunity now offered to try the virtues of the white-ash leaves. Requesting the gentlemen to

keep, in my absence, a watch over our subject, I went immediately in search of the leaves, and on a piece of low ground, thirty or forty rods back from the river, I now found, and, by the aid of my hunting-knife, procured a small white-ash sapling, eight or ten feet in length; and, with a view to make the experiment more satisfactorily, I cut another sapling of the sugar maple, and with these wands returned to the scene of action. In order to cut off a retreat to his den, I approached the snake in his rear. As soon as I came within seven or eight feet of him, he quickly threw his body into a coil, elevated his head eight or ten inches, and brandishing his tongue, "gave note of preparation" for combat. I first presented him the white ash, placing the leaves upon his body. He instantly dropped his head to the ground, unfolded his coil, rolled over upon his back, writhed and twisted his whole body into every form but that of a coil, and appeared to be in great anguish. Satisfied with the trial thus far made, I laid by the white ash. The rattlesnake immediately *righted*, and placed himself in the same menacing attitude as before described. I now presented him the sugar maple. He lanced in a moment, striking his head into a tuft of the leaves, "with all the malice of the under fiends," and the next moment coiled and lanced again, darting his whole length at each effort with the swiftness of an arrow. After repeating this several times, I again presented him the white ash. He instantly stretched himself out on his back, and writhed his body in the same manner as at the first application. It was then proposed to try what effect might be produced upon his temper and carriage by a little beating with the white ash. This was administered; but instead of arousing him to resentment, it served only to increase his troubles. As the beating grew more severe, the snake frequently stuck his head into the sand as far as he could thrust it, seeming desirous to bore his way into the earth, and rid himself of his unwelcome visitors.

Being now convinced that the experiment was a satisfactory one, and fairly conducted on both sides, we deemed it ungenerous to take his life after he had contributed so much to gratify our curiosity; and so we took leave of the rattlesnake, with feelings as friendly, at least, as those with which we commenced our acquaintance with him, and left him to return at leisure to his den.—*Silliman's Journal*, No. 54.

CORRESPONDENTS.

P. A. S. will perhaps learn more by following up her own ideas for a little while. The subject is infinitely divisible.

MR. SMITH will lecture on Sunday evening next, at 7 o'clock, at 36, Castle-street East, Oxford Market. Admittance Threepence; Ladies Free.

THE ALPINE PHILOSOPHER will deliver a LECTURE on Tellurism, otherwise Animal Magnetism, on Monday evening, the 1st June, at Eight o'clock, at 36, Castle-street East, Oxford Market. Admittance, Threepence: Ladies free. His hour for consultation is between one and two o'clock in the day-time (Sundays not excepted), or, by appointment, in the evening.

Also, at the request of the Society for the Acquisition of Useful Knowledge, the Alpine Philosopher will deliver a Lecture on Tuesday evening, the 2nd June, at eight o'clock, on the Influence of Religion upon the Progress of Mankind.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 41.]

SATURDAY, JUNE 6, 1835.

[Price 1d.]

SYSTEM OF NATURE.

ONE of the principal departments of Universalism is what the French call "progress."

This belongs to the department of "*motion*." Chemical and experimental, or mathematical, philosophy, belongs to the department of "*rest*."

Life, action, and education all belong to the former department. Of these, religion in an especial manner treats. Philosophy converses chiefly with death, inaction, and still life.

These are the peculiar features of the two, though each encroaches on the other's province.

The two departments bear the closest analogy to each other; so that having once analyzed the one, you have found a clue to discover the other.

To the study of "*progress*" we attach very great importance, because it has generally been entirely overlooked, both by believers and unbelievers, if there is a difference between the two. All faith, and hope, and anticipations of futurity, are built upon this basis only. If the reader don't preserve before his mind this one word, and the ideas associated with it, we speak to him in vain; all that we say is a dead letter. With this idea before his mind, we have some well-founded hope of systematizing his thoughts upon the universal principles of doctrinal religion.

In our last we showed some of the threefold arrangements of Nature; but we might have filled a whole number of the *Shepherd* with similar triads. Enough, however, was adduced to demonstrate the *naturality* of the threefold progress of the Church itself, which is one of the most important objects which we have in view.

Moreover, we demonstrated that two of these belonged to the evil department—the department of strife, both physical strife in warfare, and spiritual strife in doctrine and science. The third belongs to the good, and is the sphere of union and peace.

The physical strife is first developed, inasmuch as it partakes more of the animal nature; the spiritual is afterwards gradually developed, as knowledge and metaphysical enquiry progress. The third is established when the two former are set at *rest*, i. e. in a comparative sense.

The two first stages are represented in the church of progress by Jews and Gentiles, whose strife or division is manifested in a peculiarly striking manner; the first representing the *physical*, are physically, or literally, and bodily, scattered over the whole world; the second, representing the *spiritual*, are spiritually scattered in sects

and opinions, to infinity; there is no numbering the genera and the species of Christians. These two are the carnal and spiritual Jews, and the threat of universal scattering is clearly fulfilled upon them.

The spirit and the body make up the individual nature. Therefore the Jews (the body) and the Christians (the spirit) make up the church.

Nature, however, is twofold in quality—evil and good—and these two must be developed. The spirit is the active principle in both. Before the good can be manifested, the evil must die; that is, the organisation resulting from the first compound of spiritual and temporal must be destroyed—Jewism and Christianity must die. But, as we are taught that after death there is a more refined and perfect existence, called the resurrection, in which the spirit inhabits a new body, called the soul; so, in perfect correspondence with this death and resurrection, are we taught that old society, or the conflictive system, undergoes a dissolution, and the world is regenerated on a new principle; the spirit departs from the grosser body to inhabit the more refined. This is the final stage of universal and individual progress. The millennium is the soul of human progress—the "*rest*," or repose, of society.

Besides the Jewish and Christian church, there is no other *progressive* religion. These two, therefore, hold the same rank amongst religions as man and woman amongst the brutes. In other words, they centralize and subjugate all the rest.

The two first stages represent evil, or the two principles in conflict or separation, as we showed last week in the emblem of the tabernacle; which being divided into 1000 parts, gives 666 for the two-thirds, or old world, and 333 for the one-third, or the new world. The first number is the number of the beast.

In these two first stages every species of evil—physical, intellectual, and moral—is manifested; and in accordance with this scheme, *revelation* itself is a lie, or a mystery, speaking a double language, which man cannot understand, because he has not been called to the great marriage union of the two principles of Nature.

This double language we have often explained, and may be illustrated shortly thus:—We may affirm in one sentence that "evil is good," and in another that "evil is not good." This is a double language, and both propositions are true. Evil is good in its ultimate consequences, as giving experience and knowledge of nature to the creature; evil is not good in its immediate or present sensations. This is the language of revelation, and applies to all universal subjects, without

a single exception: they are all susceptible of a twofold aspect.

When man lives in those two departments of "*progress*" which represent evil or conflict, he does not understand this double language, and consequently divides into sects; one supports one side, another another side; and each strives to prove the other a liar and an impostor, or fool, to no purpose, for both parties have truth on their side. But when they come to the third stage of *progress*, i. e. *unity*, the two modes of speech become one, and that which formerly appeared a contradiction and an absurdity, becomes quite reconcilable with the fundamental principles of science and sound logic. This consummation is the marriage of the Lamb,—the double nature, or male and feminine essence, joined into one.

But it may be replied, that there are more than two divisions of party spirit in society, for the whole mass is a scene of infinite division of thought and opinion. Most true; but all this division resolves itself into a twofold character; a yea and a nay upon separate questions. Thus, a churchman and a dissenter differ upon one great question of political establishments. This is a general distinction; but some dissenters deny the divinity of Christ, others do not. Those who do not will join the church upon this article of faith, and fight under the banners of the establishment. Those who do deny it will fight against the dissenters who do not; and so with every other subject. But every subject divides itself into two with the controversialists of the world; and therefore the knowledge of the twofold or *double language* of nature is sufficient to solve all mysteries, and reconcile all sects and parties.

This division of mind is not to be ascribed to accidental unfortunate circumstances, knavery, imposition of priests, conjurors, and tyrants, or any other chaotic reason; but solely and wholly to the original plan and purpose of the universal spirit in the education of man. So that the human mind was blinded, and led necessarily into this divisive system, on purpose to exercise the reasoning faculties and develop the energies of humanity, as well as to teach man by experience the intricate subtleties of Nature. It is a *plan*, and the mind is darkened till the time appointed, which time is as fixed and certain and exact to a moment, as the rising and setting of the sun itself. The whole system is a piece of machinery, and each man is a wheel which serves to preserve and regulate its movements.

The instrument by which this division has been accomplished is, in respect to man, ignorance. But ignorance is a mere negative, and not the only means of deception. Revelation is another and a positive instrument. Revelation has *deceived* by speaking a *universal* language in such a manner as to assume an individual meaning, speaking of the type as if it were the substance. Thus the *church* in the universal sense is the system of moral and social harmony which results from unanimity of opinion and moral feeling. The type of this church is a sect. The promises to the true church being addressed to sects and individuals, have been individually understood as applying to those in a literal sense. This is the trick, and this one instance is a spe-

cimen of all the rest. The Jews are the running types of humanity at large. The prediction is partially fulfilled in the type, but fully realized in the substance. When compared with the new world, they are types of evil—hence their scattered condition; when compared with the Egyptians, they are types of good—hence they have always succeeded in amassing fortunes according to the promises; and the Egyptians, or Gypsies, of whose identity there is no reason to doubt, have in their scattered condition been universally poor, as well as despised and persecuted, according to the threat, "I will scatter the Egyptians among the nations, and disperse them through the countries: I will diminish them, that they shall no more rule over the nations." (Ezek. xxix.) These two are merely the positive and the negative of the physical scattering, and the Mahometan and Christian the positive and negative of the spiritual scattering. They will all be gathered, and they will ultimately draw towards them the rest of the human family, which is all included in the house of Abraham, the church *moral* and *divine*.

Remember, we do not say that the individual sense of revelation is all false: it could never have been received and credited if it had been so. There was a necessity for partial truth to give it a footing in society, and a necessity for partial falsehood to prevent it from getting a sure footing, and thus establishing society upon a weak foundation. The universal and spiritual sense is the ultimate and *liberal* interpretation. This view of the subject makes revelation both true and false, according to our double doctrine; false when personally and partially explained, true when universally explained. The same may be said of God. Hence, although we teach that God is the author of deception, and has actively, and immediately, and designedly deceived mankind and falsified his word, we at the same time affirm most positively that God is true and cannot lie.

If our readers cannot understand this without further illustration, they are mere babes in the knowledge of Nature, and all their "*facts*" and their "*science*," and other individualities, are of less use than a pinch of snuff for promoting social union. A pinch of snuff is often a very good vehicle of fraternal sympathy; but "*facts*," "*isolated facts*," which are not concentrated to demonstrate a universal principle, are mere dust for throwing into people's eyes. In fact, this word "*facts*" is becoming quite ridiculous in the mouths of many who use it; like the sword of the coward, it is most frequently brandished by those who least employ and search after the thing which it represents; it is merely a puff to support and push forward some piece of intellectual quackery, which a few real facts would burst and extinguish like a soap-bubble.

The old world is the world of individualities, or in other words, types; for it is impossible to make any thing else of individualities than what the religious world calls types. Individuals are images of universals, and types are the same. Hence all religions are types of universal principles in human nature. The progressive are types of the progressive principle; the stationary, of the stationary or conservative principle; the meta-

physical and philosophical, of the intellectual principle; the credulous and superstitious, of the confiding principle; and all together, of the individual exclusive principle; for not one of them all has got the slightest idea of the double language of Nature, by which they can all be reconciled.

We shall endeavour next week to cluster together some of the leading peculiarities of religions in general, and show the simple manner in which they may be amalgamated upon universal principles. We originally intended to take up their doctrines individually, and illustrate them in detail; but now we consider that this will be unnecessary. A hint will be sufficient for those who take an interest in the subject; and on those who read with indifference or neglect, we do not feel disposed to waste our time, which may be much more usefully employed.

THE SHEPHERD.

ANSWER TO THE LETTER ADDRESSED BY MR. D., OF EDINBURGH, TO THE ALPINE PHILOSOPHER.

(See *Shepherd* No. 38, pp. 300—302.)

DEAR SIR,—I shall not attempt to offer any apology for my negligence in answering so kind, so interesting a letter. I must plead guilty, and throw myself entirely upon your mercy: yet there is a circumstance which may alleviate my fault, which is, the perfect correctness of your views regarding the negative pole, and the method of awakening the somnambulist to the diurnal life.

The solar life is now the positive, ruling pole; the nocturnal is the negative and subordinate. When the second is produced by psychological, magical, or physical means, it lasts but for a certain period. The intensity of the artificial nocturnal life, and its duration, depends entirely upon the double affinity of the agent and of the recipient, and upon the nature of the disease.

In cases of the highest degree of somnambulism, sleep lasts often for several hours after the departure of the magnetiser. In such cases the patient falls even into the state of somnambulism without being magnetised.

Generally speaking, the state of clair-voyance reaches its acmé in the middle of the magnetic sleep; and is less intense at the beginning and at the end of it.

In some cases, it is possible to cut short the magnetic sleep by ordinary means; but it is very injurious to do so. I have seen fatal examples of such injudicious awakening of somnambulists.

Since the somnambulists foretell, with the greatest exactness, the period of their crisis, it is the duty of the magnetiser not to disturb this important evolution; yet, in cases wherein the somnambulists themselves require to be awakened sooner, the method employed is to invert the movements, and pass the hands slightly from the extremities to the head. Sometimes, however, it is better to blow gently upon the solar plexus, or to ventilate the head, using the palms of the hands as fans.

The way in which Pythagoras, and many seers of the middle ages, produced ecstasy in and by themselves, was by abstinence from animal food, from venery and liquors, by profound silence, contemplation, and sleeping supinely after several nights of watching.

By these means they appear also to have produced a kind of phosphorescence around the head.

The more I reflect upon this subject, however, and the more I compare my own experience with that of others, the more I am convinced that all physical modes employed to somnambulize and to dissomnambulize are but accessory or preparatory; that the only real and principal agent is the relationship to the divine centre; and, consequently, that the magnetical operation is absolutely magical or spiritual.

I am sorry that my practical occupations prevent me from answering more fully and accurately your most excellent and courteous letter; and I remain, Sir, yours very respectfully,

THE ALPINE PHILOSOPHER.

THE DOCTRINE OF THE "WOMAN."

NO. IX.

It is foolish to question "which is superior, the male or the female?" Each is superior and inferior. Each has a department for which it is peculiarly organized, both internally and externally, both actively and passively, intellectually and morally. Some, we know, question this, and adduce as objections well-known and familiar instances of inferior men and superior women, who have exchanged the relative position of the sexes, and occupied each other's sphere of physical and intellectual activity, as well as of moral feeling. These exceptions, as the grammarians say, only confirm the rule, seeing they are pointed out as singularities. But we shall soon settle the question by our analogical reasoning. Nature has made the male more robust in body than the female; larger bones; larger feet, hands, head; broader shoulders; thicker and rougher skin, firmer muscle, and stronger tendon; and above all, a much less irritable and feverish nervous system. Nor is this owing to education, training, or any other contingency arising from the caprices of human fashion. No species of bodily labour will give a brawny, muscular arm to a woman, equal to that of a hard-wrought labouring male, or make the beard and whiskers vegetate upon the cheeks. Her whole frame is more round and smooth; the bones well covered with flesh; the cheeks less hollow; the eyebrows less rugged; the shoulders more round, the neck more slender; the skin more fair; the whole frame, in fine, partaking more of the character of passivity and beauty, than of activity and power. These are some of the bodily distinctions which are visible to the eyes. What is the use of questioning, therefore, the intellectual and moral distinctions, which the sensual eye cannot discover, but which are perfectly discernible to the mental eye of every candid student of nature? Can a materialist doubt the distinction? then he must also doubt his own elementary article of faith, that the mind is the effect or produce of the bodily organization. Can a spiritualist doubt it? then he must also doubt the harmony that subsists between the physical and spiritual world, upon the presupposition of which his own doctrine is founded.

It is evident that there is a decided sexual distinction in intellectual and moral, as well as in physical nature; and this being the case, it follows that there al-

ways must be a sexual distinction of human industry ; a male and a female department of physical, intellectual, and moral action. But it does not necessarily follow from this, that any positive statutes, or even formal regulations, are necessary to dictate to either sex their respective employments. This is one of those infinite and unsearchable subjects with which it is presumption in a legislator to grapple. The two characters blend and intermix in nature ; the feminine nerve often vibrates in the body of a male, and the muscular in the delicate frame of a female. The intellectual energy of man is often found in the mind of a woman ; and the delicate sensibility and refinement of woman in the robust and rugged exterior of a man. But the masculine woman and the feminine man are never so much admired as those who inherit the peculiar distinctions of their own sex.

We know that there are some female murmurers who repine at the injustice of Nature in bestowing more physical energy upon man ; and who wish they had the strength of Hercules in their arms, that they might knock down or keep in awe the proud lords of creation, who have enslaved their sex. If they had their will, they would alter the plans of Providence, and make woman as muscular and energetic as man. What would they gain by this Reform Bill, if they had influence sufficient at the court of Heaven to get it passed ? They would make earth a greater hell than ever it was, or ever can be ; for the women would make so many more men to the males, and the men so many more women to the females : it is better as it is.

But what is the reason why women think themselves inferior, or that men entertain this opinion of the opposite sex ? The reason is, the depravity and ignorance of humanity in its present state of progress. The reason is somewhat similar to that which induced the ancients to esteem a warrior or a wholesale murderer the most honourable of all professions, and the innocent, bloodless sympathies of female tenderness as the lowest species of human virtues. This old barbarous moral taste still lingers behind, and maintains its ascendancy in the human breast, but not to such an extent as formerly. A common soldier is now the very lowest order of political slaves, the only wretch who is subject to the discipline of the whip, from which every other species of servant enjoys a perfect immunity ; and a military officer is so much ashamed of his cloth, that, except upon duty at a parade or review, he disguises himself within the more respectable uniform of a simple gentleman, i. e., a man clothed with the moral and bloodless character of woman. This is the genuine meaning of the word, a meaning to which it must uninterruptedly progress, until violence and its bloody instruments of destruction sink into contempt.

Woman, even now, therefore, has a superior moral character ; for man improves his own character by merely borrowing from her. What inferiority, therefore, does woman complain of ? physical and political weakness ; and in doing so, she only proves that she is yet too ignorant and unrefined to make a proper estimate of her own natural character. Did she know the worth of her own moral character, she would glory in it ; for woman will

yet prove to be the head of man. It is for the *moral* that all the other attributes of Nature exert themselves ; for in the *moral* alone are the highest pleasures of life experienced. As this department rises in estimation, and puts to shame the scarlet garb of the shedder of human blood, the female nature, its type and representative, will rise along with it. Hence arise the external deference and politeness which are now manifested towards the tender sex in all civilized nations ; which acts of courtesy are still, it is true, mere hollow and ostentatious flatteries, which afford small compensation for the arbitrary and capricious tyranny which is exhibited in other modes of treatment ; but it is the dawn of an important moral revolution in the human mind, which, according to our principles of progress, always and necessarily manifests the false immediately before it brings forth the true.

This is the bird's-eye, universal view of the subject ; the only view which presents it in its true colours.

TO THE ALPINE PHILOSOPHER.

DEAR SIR,—Seeing that your magnetic science is related to the spirit and the universal science, I go on with the permission you granted me to ask you a few more questions.

1. Is there a sickness peculiar to the night life, and is there a sickness peculiar to the day life ?

2. Has the day life a powerful influence on the night sickness, and the night life upon the day sickness ?

3. If evil in the will be that which must be sacrificed to get rid of all disorders, must it not be the same evil that we must act upon to get rid of any disorder ?

4. If man at first be an *active being*, with consequent thinking and feeling, will he not at last be a *FEELING BEING*, with consequent thinking and acting ?

5. Is not man to be a threefold feeling being, with subordinate thinking and acting faculties ?

6. Is not the will the concentrating esse, by which we have the closest and most faithful relationship with the centre, and become feeling beings ?

7. Must not all our principles be in obedience to the concentrating will, and the will in its highest feeling sense united to unity ?

8. Can any very powerful magnetic result be wrought when the *will* does not stand in a concentrating disposition, or individual-*felt* consciousness ?

9. Has not the magnetic fluid a tendency to bring the will into a concentrating state, that it may consciously receive and retain the divine fluid ?

10. Is not the magnetic fluid substantial, and do not material things differ from *substantial things*, as derivative and primitive ?

11. Ought not the mind of the magnetised to be usefully employed while it is under the magnetic treatment ?

12. Will not useful mental employment facilitate the spirit that is to effect the cure, be it in whatever degree it may operate in mediums ?

13. Does not unity, as the uniting spirit, abide in the will, and cause it to act concentratively ?

14. Ought not the senses to be in obedience to the un-

derstanding, and the understanding to the concentrating will, and the concentrating will to the spirit?

15. If the will has an outward bias given to it, will it not rather tend to dispersion than concentration?

16. Can we not so conduct ourselves as to die to the first life, and receive the second life, and live the same in space and time?

17. Or may not the eternal life be expected by those who are unwilling to give up the *time* and *space* life, and all its conflicting consequences?

18. Does not this *second life* moderate much the inconveniences of the divided and conflicting bipolar lives?

19. Is not the second life a *double life*, and is not the first life rather bipolar deaths?

20. Do not the two poles correspond to *death* rather than to life?

21. Do we not derive all our real consciousness from our second life, and all the deadening of this consciousness from the *first life* (or bipolar deaths)?

22. Does not the *second life* act concentrately, and the first life dissipatingly?

23. Ought we not rather to seek the second life, than to busy ourselves so much to preserve the first?

24. Does not the magnetic success tend to favour the progress of the *second life*?

25. Is it not the *second life* that overcomes the evil and its consequences in the first life?

26. Can the evil in the first life be overcome, if the second life does not make a progress?

27. Does not progressiveness depend on the second life, and destructiveness on the first life?

28. Has not the second life an interior tendency, and the first life an exterior tendency?

29. Does not the *will*, in its secondary relationship with unity, in all its aspects exhibit sickness, disease, disorder? and,

30. Does not the *will*, in its primary relationship with unity, in all its aspects exhibit *health*, *ease*, and *order*?

31. Is not the divine sense the fruit of the primary relationship? Does not love, in his primary relationship with the will, act within, in the eternity?

32. Does not love, in his secondary relationship with the will, act within, in space and time?

33. Will not all mystery vanish when the *divine sense* is born? and can the divine sense be born, before the primary relationship be established by unity within the will?

34. Has not the divinity three aspects: a natural, a spiritual, and a divine aspect; an inward, more inward, and most inward?

35. Does not the man represent the physical aspect of the divinity, and the woman the spiritual? and do not the *man* and the *woman*, when in harmony, represent the *divine aspect*?

36. As man cannot appreciate his primary relationship with the Creator, till the divine sense be born, must not the will be induced to wait patiently for this phenomenon?

37. Must not the aim of the healing art be to bring the *will* in the way of the centre, that will bring about the primary relationship, the divine sense?

38. Are not the whole host of social virtues, from the

centre, by the will, when the will is magnetized, to bring forth the same in a divine manner?

39. Ought not the magnetizer to do all he does, from the centre, and for the sake of the centre; or from love itself, for the sake of love itself?

In rest, yours most truly, J. P. G.

MARRIAGE.

THE above is a diagram of our friend Mr. G.'s, which he has invented to illustrate his own ideas of marriage, and other universal subjects. We shall make our own use of the figure, appropriating it as our own, according to the Owenian and Christian principle of a community of good. The three horizontal lines which unite the two triangles, represent the three-fold division of Nature, which the mystics call the natural, spiritual, and divine senses—the spiritual, voluntary, or under the influence and direction of the will; the divine, involuntary. When the male and female are united by this threefold cord, their union is perfect; when one or other is a-wanting, it is imperfect and easily dissolved; to prevent which dissolution, in a state of imperfection, it is necessary to invent an artificial bond, which we have denominated formal or church marriage, which may, and sometimes does, bind individuals together who are not united in affections by either of the three bonds of union. Marriages are generally induced by the instinctive or natural sense; sometimes they imbibe a portion of the spiritual or intellectual bond; and, still more rarely, of the divine or highly purified moral and sympathetic feeling. It is only by this latter principle that the marriage is completed. This is Heaven! the soul, the inward nature, the divine essence of pure sympathy and social love. When these three bonds exist, there can be no occasion for the church or formal marriage; the latter only forms a substitute to supply the want of the other, and also to make legal provision for women and children, in the event of the death of the paternal head of the family. It is *not* marriage, but only the type, emblem, or political symbol of true marriage. But men in this old world universally mistake the *type* for the *substance*.

LORD BROUGHAM ON NATURAL THEOLOGY.

LORD BROUGHAM has just published a volume on "Natural Theology," which we have perused with considerable interest. It takes a very humble title, "Paley

Illustrated," as if merely an appendix to the popular work of the Archdeacon; but it assumes a higher ground of argument than the latter, and although from the pen of a lawyer, whose habits of life and subjects of contemplation are very far removed from the abstract spiritualities which constitute the professional employment of a clergyman, there is evidently a much finer taste for metaphysical enquiry discernible in the work than is generally met with in the dissertations of the clergy. We cannot but be pleased with his statement of the controversy respecting mind and matter, when his own opinions so exactly correspond with our own. "That all around us should be only the creatures of our fancy, no one can affirm to be impossible; but that our mind, that which remembers, compares, imagines; in a word, that which thinks; that, of the existence of which we are perfectly conscious, that which cannot but exist if we exist, that which can make its own operations the subject of its own thoughts—that this should have no existence, is both impossible, and indeed a contradiction in terms." In other words, he maintains the primary existence of mind, and the secondary existence of matter. Were Bishop Berkeley's theory treated with that respect to which it is entitled, it would amount to nothing more than this. But neither his lordship nor the bishop employ that nice distinction, peculiar to our bipolar doctrine, of the *universal* mind and the *individual* mind, the very use of which would throw a flood of light upon the whole science of Nature. The "fancy" would then assume a double character, *human* and *divine* in union, and the fanciful creation of matter become quite intelligible; but in the single sense in which his lordship uses words, (for he has no idea of the bipolar doctrine,) it is impossible to entertain for a moment the idea that matter is a creation of *our* fancy; for our, that is, our individual fancy, only creates what we will to create; but the universal or divine fancy, which resides in us, creates our involuntary sensations, and communicates a vivid and permanent reality to them. Even our dreams are not the creation of *our* fancy individually considered, but only as conjoined with the divine imagination, which is the true creator; we are mere patients. Still his lordship's language is correct.

His critique upon Mirabeau's System of Nature, which he says is not Mirabeau's, but supposed to be written by "Baron d'Holbach," is very just. The whole work is built upon a mere hypothesis, which the author never attempts to prove, and never possibly can, namely, the primary existence of matter. Knowledge of the existence of matter is an inference; but our knowledge of the existence of mind is an axiom, a consciousness. Materialism, therefore, never can be the basis of a system of nature, since itself is founded upon another basis, namely, mind itself, or mentalism.

The discourse does not comprehend more than two or three of the leading features of natural theology, such as the deity, the human mind (which the author does not distinguish from soul, as the *shape* which envelops the mind), and the doctrine of a future state; but the reasoning upon those points he has thought proper to select is very clear, and perhaps as conclusive as any which we have ever read from the pen of one who has followed up the old system of the analysis of Nature. He has not even made a single allusion to the subject of the origin of evil, which is the pivot upon which the whole question of theology revolves. Without clear views of this important subject, no argument upon any minor department of theology can ever prove final. What is this power which is called God, whose existence, physical, intellectual, and moral, we confess and contend it is the excess of fanati-

cism and irrationality to doubt? Is it a universal power, or a partial power? Is it *all* power, or only the original power? Is there any other power but God? His lordship has not answered these questions; and it is impossible for us to determine from the work before us what are his ideas upon the subject. He evidently, however, gives the professors of the old school good reason to suppose that there are *powers, minds, wills, &c.*, in existence which are primarily and essentially distinct from God, and acting under an influence which does not proceed from him; and yet he says, "all seeming disorder is harmony, all chance design, and nothing is made in vain;" in other words, evil is only temporary, partial, and apparent, tending to universal good in the end. If temporal evil be ultimate good, there is nothing derogatory to God in ascribing to him the authorship of evil. But his lordship does not do this; it was, perhaps, too bold a step, even if he thought it: a man in his station is not so free in the expression of his thoughts as we in our humble sphere. Notwithstanding, we have not even the suspicion that such are his thoughts; we have even a demonstration that they are not, in the assertion (for it is nothing more), that natural religion teaches us that God would not deceive us; and therefore a revelation attested by miracles and prophecy, &c., "is unimpeachable and invaluable." This should have been demonstrated, for although it is evident that God will not deceive *ultimately*, he may deceive *for a time*, for the exercise of the human mind, as the Scriptures themselves unequivocally maintain; consequently a revelation from God, attested with all the *superhumans* and *supernaturals* conceivable, may be deceitful for a given time, and the query is, "is the religion of Christianity deceitful—has it deceived? have we been taught its final meaning? or may it not be transformed, metamorphosed, and obliterated, like the old religion of Moses?" This is the "science of progress," a most important branch of natural theology, which the learned author has entirely overlooked. We question much if his mind has ever been directed towards it, for he seems to have been guided in his treatment of the subject more by the opinions of men of great name than by any of the recent opinions of the van of theological science.

We hope his lordship will come to the resolution of continuing the subject, and give us his views of the origin and use of evil, its connexion with the divine mind, and the correspondence which subsists between the analytical division "of existences only," to use his own language, and the successive stages of progress as developed in "time." He adopts the threefold system of physical, psychological, and ethical, or natural, intellectual, and moral, in respect to mere existence, without relation to succession and educational growth. But these divisions are observable also in the progress of the individual, the species, and the church. Man is first a mere physical or sensual, then a spiritual or thinking, then a moral being. Society was first physical or sensual, then metaphysical or spiritual, and last of all it becomes moral. And the church was first Jewish, mere physical; then Christian, or metaphysical and doctrinal; and now it contemplates a third stage, of moral and divine. This is a science, or system, not a mere fancy, and as demonstrable as any of his lordship's existences; it also belongs to natural theology; and in fact is that department which gives life and motion, faith and hope, to the science. A religion which does not treat of progress is a religion of death. Notwithstanding, the view which his lordship has taken is the foundation of the other; nor by continuing the subject does he require to retract, although he would cer-

tainly be obliged to illustrate much of what he has written.

Notwithstanding all the omissions or imperfections to which we have alluded, the work is calculated to do much good. But it unfortunately happens that whatever good it is calculated to do, must be confined entirely to the class to which his lordship belongs. The whole work might easily have been published, in a small popular form, for one shilling, or one-and-sixpence at most, and realized a much better profit than can ever arise from it, in octavo, at eight shillings. All Paley's works, well printed, and quite as well bound as Brougham's discourse, can now be purchased almost anywhere for five-and-sixpence; and the reputation of his lordship is certainly sufficient to give a very great circulation to any work of a generalizing or popular character. But the vulgar have not more need of natural theology than the rich. They are nearer the original source of information, unadulterated and unsophisticated by the illogical wrangling of the schools, which we never can believe his lordship has got rid of, until he give us some satisfaction upon the subject of "physical, intellectual, and moral evil." Does he agree with the scholastic theologians upon the subject? or is he afraid to speak his mind? If he agrees, he may write to eternity without producing any beneficial effect, for it is only the confusion of counsel by words without meaning, to assert that God is not the author of the evil and the good; and if he is afraid, then we ask him plainly, if he does not see the wisdom of God most clearly manifested in raising up teachers in a *humbler walk* of life, who are less influenced by what is called respectability of character, who never meet a bishop or a church dignitary eye to eye, or have the slightest intercourse with those whose family, or pecuniary, or personal interest it is to preserve the dogmas and ceremonials of the church as it is; in raising up such teachers of the public mind to do a work which a lord or a gentleman *cannot*, because he has not courage to, accomplish. It was so in all ages, and must be so while God and Nature are unchangeable. All reformations are urged on by the poor; they are even suggested by the poor, or by men of education and mental enthusiasm who have descended to the level of the vulgar mind, and thrown themselves for patronage upon that portion of the people with whom God begins every new moral and spiritual movement.

We repeat, that we are pleased with many of his illustrations and arguments, and coincide with almost every sentence in the book. But his task is not finished. We cannot tell what he thinks upon the main subjects of "evil" and "progress," subjects from which he could not be deterred by any difficulties which they present, (for they are most beautifully simple,) *unless* he is still in the fetters of scholastic or exclusive theology, and believes or imagines that there is a physical, intellectual, and moral power in being, which is not God. In other words, let him refute "Pantheism," (not Spinozism,) or profess it; and tell us what he means by "no chance, no disorder, all design," if he is not a Pantheist. Let him write a discourse on those words of scripture applied to God, "*All and in all*;" "*Alpha and Omega, the beginning and the ending*;" "*I make peace and create evil, I the Lord do all these things*." It would be much more interesting than the present volume.

Since writing the above we observe an announcement of other two volumes upon the same subject of Natural Theology, by Lord Brougham and Sir Charles Bell, in conjunction. Sir Charles, we suppose, will give the physiological illustrations of the wisdom and design

manifested in the works of creation. Nothing certainly can be more interesting and instructive, not because it tends to convince us more of the existence of a universal and intelligent spirit, which none but hopeless fanatics can dispute, but because it gives us more sublime and ennobling conceptions of Deity, and more cheering prospects of our own ultimate destiny. His lordship, therefore, means still further to develop his views of natural religion; most probably the forthcoming discourse will treat of "Deontology," or moral duties, and be ushered in by an introduction concerning one important point to which we have alluded, namely, *evil*. Had we observed this announcement before writing the above article, we should have expressed ourselves differently, but our meaning would have been the same. We shall give a specimen of the work next week.

THE SEER OF PREVORST.

DEAR SHEPHERD,—In the short account of this modern revealer which I gave you, I alluded to the latent influences which she was enabled to discover in the three kingdoms of Nature. I said that antiquity would be found to be wiser than its critics will feel disposed to allow, in its consecration of certain plants, stones, and other growing substances, to *holy*, that is, to *healing* uses. This day I shall confine my extracts to an enumeration of some of the virtues, positive and negative, of the bodies of the material world, which entitled them to be worn as beads, amulets, rings, or safe-guards, by those whom we censure as ignorant idolaters, or superstitious dupes. I shall not examine whether these substances owe their properties to a sideric, magnetic, or magic power, nor whether these properties were made known, in old days, by reasoning or by revelation, by science *a priori* or *a posteriori*. I mean to merely report Dr. Kerner's experiments upon his somnambulist, and leave others to fathom the mystic relation between the life of minerals and that of man, and to settle the point where spirit is, and where it is not, as they deem fit.

I shall commence by observing that these experiments were all made by placing the stone, or metal, or plant, in the left hand of the Seer (which seemed to correspond to the negative pole); and that when placed in her right hand (the positive), it was still the left which made all the motions of feeling, quivering, and so forth, as if the mineral were actually in it. It was judged right to try whether her eye, smell, or sense of weight, had any effect upon determining her perceptions, and for this purpose the minerals were separately tied with a string five yards long, which was brought from an outer room, and placed in the left hand of the somnambulist, and that the sensations she assigned to each mineral were exactly the same as if she had them placed in the hand itself; also, water in which a mineral had been dipped for a short time, produced the same effect, but in a milder degree, as the handled mineral itself would have done. A hazel-rod touching a stone or metal equally gave the same symptoms. Thus nothing was omitted to confirm these experiments. The cabinet of a mineralogist, Herr Tilot, consul at Heilbronn, was placed at the doctor's disposal, and the owner noted the result, and has given an official report of them.

Sapphire and doppelspath threw her from the half-waking state into somnambulism; gypsum and mica gave her cold cramps and shudders; spinell, augit, and other minerals with magnetical power, particularly the loadstone, affected her most painfully, as did iron.

In general, the highly coloured stones caused the strongest spasms, such as red garnet, schorl emerald,

rock topaz, amethyst, red quartz, red jasper, zabrador, feld-spar, and the like; while the light or transparent stones had a contrary or soothing effect. A piece of glass or rock-crystal never failed to awake her. If either of these was laid for a certain time upon the pit of her stomach, a perfect cataleptic stiffening of all her members succeeded. Sand had the same effect; its smell, however, had a favourable effect upon her nerves. Pebbles, particularly flints, produced rigidity of her muscles; white fluorspar, on the contrary, produced extreme relaxation in them. White ponderous spar liberated her from the most distorting cramps, and caused an agreeable heat throughout her system, which sometimes, too, amounted to a high fever. Witherit occasioned great irritation in her diaphragm, and consequent laughing; while carrara-marble caused such fidgets or agitations in her muscles, that she could not support its long application. Alabaster, and some some sorts of pyrites, did the same.

On the other hand, the volcanic products, lava, pumice-stone, left no sensation, as though they were consumed, lifeless masses. These are but a few of the trials made upon her sensibility to mineral agencies. It is to be observed, that at most the contact was only with the left hand; the physician would not, beyond a few trials, permit her solar plexus to be experimented on, on account of the violent effects wrought upon it; but still the patient felt the impression there. The names of these minerals were not told to her, for fear of misleading her associations. She indicated their smell and taste, as if she had smelt or tasted them. Salt, in her hand, made her mouth water, and if copper were left there any time, it created nausea, even to vomiting. Resemblance in the bodies had no effect in altering her perceptions of their genuine nature; witherit caused her always to laugh, while fluorspar brought her to the half-waking state, though it would have puzzled a good mineralogist to distinguish between the numerous specimens of those two fossils which were presented to her.

This will be enough for the picking of the philosophers, who contend that all our knowledge is derived through the five senses. To these sensations the Seer of Prevorst, in her waking state, was no more alive than others; but when her nervous system was excited by the magnetic stream, then she seemed to have the power of penetrating, as it were, with nervous feelers, into the hardest substances, and in most instances her report of them coincided with the legendary character assigned to them from the remotest antiquity. It is not, therefore, at all improbable, that the first rude system of natural science was revealed by seers and visionaries, and that it was upon their sayings that wholesome or poisonous properties were assigned to minerals and vegetables.

From the earliest ages secret virtues were known to exist in stones. Orpheus sings of the earth producing good and evil, but against every evil an antidote—of stones growing out of earth—of their never-dying, ever-young indestructible virtues, for which he ranks them above fruits and herbs.

The Jewish high-priests wore precious stones over the solar plexus, which were thought to produce in them a prophetic power. Aristotle, Dioscorides, Galen, Avicenna, Albertus Magnus, and especially Pliny, have written concerning the magical power of stones. The origin of wearing diamonds and precious stones arose from this species of fetichism, namely, traditionary evidence of their magnetic effects. Diamond was a talisman against poison, evil spirits, and wild beasts; agate saved from the bite of a scorpion, and made the wearer cheerful;

ruby shielded off bad smells and miasmas; garnet made the heart glad; chalcedony gave the sense of triumph; topaz favoured chastity; sapphire was used against the dropsy; jasper stilled the blood, and made the eyes bright; amethyst guarded from drunkenness, and gave good thoughts and wisdom; chrysolite caused melancholy.

These were not mere fictions of antiquity; they had their foundation in the well-observed phenomena of external nature. The ancients were better observers than we; and in this department of sensations their field was larger, for those effects upon the nerve-spirit were more frequent. The infancy of human-kind was highly susceptible of these magic influences, compared with our oxydized and carbonized frames, but above all, with our materialized understandings. To this hour, in the East, where men are nearer to nature, similar virtues are imputed to stones. Every ornament, but precious stones, are scrupulously laid aside in their devotions. Sardonyx and diamond are worn to shield them from the unpleasant accidents of life.

When tested by the acuter sensibility of somnambulists, and submitted to the one single nerve-ether, instead of being delivered to the isolated mediate perception of the separate senses, this traditionary wisdom finds its full confirmation in their report of the mineral kingdom.

Diamond, rock-crystal, and all transparent bodies, excited in the seer the faculty of vision and second-sight.

In the vegetable kingdom, the laurel boughs and leaves threw her into somnambulism of the highest degree; and this reminds one of the oracle of Apollo, the god to whom Daphne, or the laurel, was consecrated, and the use made of it at his shrines by the sybils, &c.

John's-wort had equally this power of exciting vision; and a shining beetle, called by the Germans *Johannis-kaefer*, also produced this effect; and we can scarcely separate the idea which this name John creates from the scriptural mission of St. John.

These, I believe, may be called facts,—"sermons in stones." I leave the materialists and spiritualists to contend for their appropriation to their respective departments, and am, &c.,
NEBULA.

A POPE.—When Julius the Third ascended the papal chair, he bestowed the cardinal's hat on the keeper of his monkeys, a boy chosen from among the lowest of the populace, and the object of his unnatural pleasures. When Julius was reproached by the cardinals for introducing such an unworthy member into the sacred college, a person who had neither learning, virtue, nor merit of any kind, he replied, "What virtue, or merit of any kind, have you found in me, to induce you to raise me to the papal chair?" This answer was very appropriate, and showed the Pope to be possessed of a very nice sense of natural justice, as well as a sincere conviction of his own unworthiness. If God chose the chief of sinners and unlearned plebeians for apostles, why should Julius not make a similar choice for a cardinal?

The Lectures at Castle street on Sunday and Monday evenings have been discontinued for the season.—The Society meets on Tuesday evenings.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Trongate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Bready, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 42.]

SATURDAY, JUNE 13, 1835.

[Price 1d.]

SYSTEM OF NATURE.

WE shall now take up some of the leading doctrines of theology, and point out the double meaning attachable to each, by the discovery of which they may all be reconciled. These two meanings we distinguish by the names of partial and universal. The partial or individual sense is the *type* of the other, and belongs to the old world; the universal sense is the ultimate or liberal meaning, and belongs to the new world.

GOD.

Not the author of evil, inasmuch as the ultimatum of all partial evil is good.

The author of evil, inasmuch as he is the author of Nature.

REVELATION.

True, inasmuch as it is a real, involuntary, superhuman influence, which treats of the future destiny of man.

False, inasmuch as it speaks a double language, which man understands in a partial or exclusive sense, instead of taking the most liberal and extensive meaning of which it is susceptible.

POLYTHEISM.

True, as an analytical division of the deity, in the same manner as we divide science into sciences, although all sciences are one. Thus we speak of the sciences of geology, geography, mineralogy, &c.; but all those sciences are one science, namely, the science of nature. Man divides science into parts to assist his own limited and imperfect conceptions; and thus also we may with the same propriety divide the deity into his component attributes, and personify each: love, as Cupid; music, as Apollo; wisdom, as Minerva, &c.; only we ought always to remember, as in the sciences, that these divisions are merely artificial, to help our imagination; that they are

False, for God is one.

IDOLATRY.

True, inasmuch as God is omnipresent; *all and in all*; and also as a representative or typical religion, expressing outwardly in form what a spiritual religion only expresses inwardly in idea. A Christian, who fancies a divine shape in his mind, is merely the spiritual counterpart of the idolator, who fabricates one with his hand. Idolatry is simply the puerile theology of the species, beginning to teach by sensible signs what the more matured intellect will entertain without those outward semblances. It is also true so far as it deifies matter. Idols are to rude men what dolls are to children.

False, inasmuch as it limits and localizes the divinity, and divides him into unconnected parts.

MATERIALISM.

True, inasmuch as it maintains the divinity of matter.

False, inasmuch as it makes matter the basis of its philosophy, and denies the existence of spirit, or mind, as the source and regulator of universal motion and organic forms in Nature.

SPIRITUALISM.

True, inasmuch as it maintains the superiority of spirit or mind over matter.

False, inasmuch as it vilifies matter, as something distinct from and obnoxious to the divine mind; as something from which the human mind should separate itself as much as possible.

INFIDELITY.

True, inasmuch as it rejects the exclusive and illiberal creeds of all partial systems of religion, with all their monstrous doctrines of divine illiberality and inquisitorial injustice.

False, inasmuch as it denies the reality of revelation, the divine interference with the affairs of men, and all preconceived plan or purpose in the progress of society and education of man.

JEWISM.

True, inasmuch as it maintains the faith of the Messiah, or universal restoration; and also that the promise of the Messiah is *not* fulfilled in Christ.

False, inasmuch as it rejects the mission of Christ, as the *second* step of the threefold progress of the Church to perfection.

CHRISTIANITY.

True, in the same sense as Judaism, namely, as a divine institution, containing the elements of eternal truth in mystery, destined to answer a specific purpose, and stand for a specified or appointed time.

False, inasmuch as it is a mystery which is only to be explained at the commencement of a succeeding stage of the church, namely, the third, or final stage.

MAHOMETANISM.

True, as a divine mission to Mahomet and the descendants of Abraham, through Ishmael, for an appointed time; the woman's *first-born*.

False, as a mere temporary and highly mystified system, in which spiritual or intellectual truths are typified by the most absurd and extravagant language and symbols; it is also exclusive and partial: and none but a universal system can be final.

POPERY.

True, as a *model* of a catholic or universal system, in which the power of the mind supplants the power of the

sword, and unity is accomplished by the delegated authority of an individual, to which the people submit with the heart and affectionate zeal. Its base is spiritualism, or mind.

False, as a partial, corrupt, and coercive system, which, from want of universal principles, was obliged to depart from its professed character, and thus become as execrable in practice as the model was beautiful in theory; professing to teach wisdom, whilst it was busily employed in stopping up every orifice of science.

PROTESTANTISM.

True, as an apostasy from old Catholicism, by which the principle of free discussion was maintained and partly secured, and the right of every man acknowledged to think as he pleased on matters of religion, and the supreme power wrested from the hand of the priest, or moral teacher, who had profaned his sacred character by the use of the sword.

False, as a system of division and anarchy, in which the political power assumes the sovereignty over the spiritual or mental power, and thus falls into the very same error for which it reproaches the catholic. *False* as its basis is materialism, or the power of the sword.

ESTABLISHMENTS.

Right, in their original and ultimate principle of national unanimity on religious subjects, an object *desirable* to obtain.

Wrong, in attempting to enforce outward unanimity, when the unanimity of the mind is a-wanting.

DISSENTERISM.

Right, in the original and ultimate principle and motive of keeping the mind free from all coercive laws, which have for their object the artificial union of society on religious subjects.

Wrong, in the affected separation of politics and religion, which are only two great leading departments of one universal subject, namely, *public morals*.

TRINITARIANS.

Right, inasmuch as God and Nature necessarily present themselves, in every aspect in which we can view them, in a threefold character.

UNITARIANS.

Right, inasmuch as God is one, even although he must be regarded as physical, intellectual, and moral, *i. e.* as a tri-unity.

DIVINITY OF CHRIST.

True, inasmuch as God is united with man, acting in man as the prime mover or mainspring of Nature; and in a more especial sense true, inasmuch as Christ is the original founder of the greatest, most extensive, most progressive, most comprehensive, and scientifically mystical, and prophetically true; of all religions. He is therefore the prince of religions; and consequently, by the very consent of time and events, the best representative of God upon earth.

False, inasmuch as he is but a type or resemblance; merely the image of God, not the universal Deity himself.

FALL OF MAN.

True, inasmuch as man, through ignorance of nature, naturally misjudges until he corrects himself by experience. Ignorance of universal principles creates dis-

union in families, sects, and nations; and these breed infinite hostilities.

False, inasmuch as all this division is merely the road to a more perfect union, when the individual experience of men being collected to a focus, they shall discover, and act upon, universal principles, which universal principles could only have been discovered by a scattering of the people, unless they had been made known by revelation; and then man could not have been a rational being, inasmuch as he did not discover truth by his own mental exertion. *False*, also, inasmuch as progress can only be made by rebellion. A law made for man in a rude state is not a law to last for ever; there must be a spirit of rebellion to resist and repeal it.

SACRIFICE FOR SIN.

True, inasmuch as strife is necessary in the ignorance of mankind, there being no other means of settling the disputes between individuals and nations; blood must, therefore, be shed to give repose to society. This is the material sense. In the spiritual sense, the *selfish* or *individual* system must die, to give place to the social, or universal.

False, as taught by the Church, who regard the man Christ as the final sacrifice for sin; whereas he, as an individual dying for the whole, was only a type of the individual system dying for the universal system. In the old world the truths of the new are taught in types or emblems only. The true sacrifice for sin is the old or unsocial world, or the human nature of Christ; the true Messiah is the new, or social world, the divine or resurrected and glorified nature of the same Christ. These two are one, evil and good; the one dies for the sake of the other.

ETERNAL PUNISHMENTS.

True, inasmuch as evil and good, being the twofold eternal law of nature, must exist for ever; they are necessary stimulants to action; the one acts by fear and the other by love—the bipolar law. These follow us for ever: the one is hell, and the other heaven. The good that is in us will be rewarded to eternity, and to eternity encouraged to progress and bring forth its fruits; the evil that is in us will to eternity be punished and discouraged by the moral government of God. In the social intercourse of individuals evil will be everlastingly hunted; it is the victim of nature; for being infinite, its subtlety and resources are inexhaustible: but as mind progresses in knowledge the evil becomes more and more tolerable. Its punishment is eternal, inasmuch as it never dies, and is always dying or being destroyed. Its punishment is a blessing. This is the universal meaning.

False, in the individual sense, as generally taught by the priests.

ETERNAL REWARDS.

True, in the universal sense, as implying the everlasting victory of good over evil.

False, in the individual sense, as implying that some men will hereafter enjoy unalloyed good, whilst others enjoy unalloyed evil. The same miscellaneous varieties of character must exist in every state of being, but the law of progress teaches us certainly that these successive

states of being are progressively improvements of the physical, intellectual, and moral character.

RESPONSIBILITY.

True, inasmuch as Nature, or God, is a moral governor, who is always correcting us for our faults, and rewarding us for our virtues. Without natural and universal responsibility, there could be no rule of life, no moral law in society.

False, as taught by the Church, which teaches personal responsibility before a personal deified individual, acting in the capacity of a local judge. This is not responsibility to God, but to *man*, to whom we are only socially accountable. Christ would not judge any one—"Who made me a judge over you?" he said. None else is judge but God, and he is invisible, the *moral governor* of the world. But it is said that Christ shall judge the world; true, but who is Christ? There are three Christs, and one of these is the universal invisible spirit, "who is formed in us the hope of glory." He will judge the world, and we shall see him as spirit sees spirit, mind sees mind; and feel him too. He is the "Son of Man," for he will be born and begotten in man.

FREE WILL.

True, inasmuch as will and freedom are one and the same thing, and nothing can be more free than the will.

False, inasmuch as no individual portion of nature can be free in the abstract sense of the word, for it forms a fractional part of a great whole, by which it must be controlled. A self-originating individual will is as absurd as a self-originating body. All the parts of nature reciprocally act on each other. The movements of each portion are regulated by the action of surrounding powers. Every individual is actuated by the surrounding circumstances, i. e. God, or Providence, for circumstances are nothing but providence; the latter word, however, is expressive of life and intelligence, the former of death and chaos only. "Circumstances" convey a gloomy, hopeless meaning to the mind; "Providence" lights up the lamp of hope, and bestows a parent upon the solitary orphan. Men will never forsake this cheering word, but the other ought also to be used as very expressive of the general aspect of nature to the finite mind. The one belongs to the department of death, the other to that of life. The latter will be more acceptable when deprived of its partial and horrific character by the principles of universal philosophy and faith.

FATALISM.

True, inasmuch as the universe and all its component parts are under the sole guidance of the universal mind.

False, inasmuch as the actions of the individual are the result of his will and understanding, and possess all the characteristics of liberty.

ATHEISM.

True, inasmuch as God and Nature are identical, and consequently Jehovah is universal being. To speak, then, of God making Nature is to speak of God making himself. There is no author of Nature.

False, inasmuch as the Nature of the Atheist is a dead Nature, instead of the living God, eternal life and intelligence.

THE SHEPHERD.

TO THE FRIEND

Who addressed to the Alpine Philosopher the Questions inserted in pages 301 and 302 of the Shepherd.

Frustra magnum expectatur augmentum in scientiis ex superinductione et insitione novorum super veterum; sed instauratio facienda est ab imis fundamentis, nisi libeat perpetuo circumvolvi in orbem, cum exiti et quasi contemnendo progressu.—Fr. Bacon de Verulam, Nov. Org. Scient., lib. 1. apkor. xxxi.

We seek in vain for a great increase of knowledge, by placing and encompassing new facts above the old ones; the remodelling must begin from the first principles, otherwise we move in a perpetual circle, with a mean and almost contemptible progress.

LORD BACON.

You have, my worthy friend, addressed to me several queries touching science, which, in the letters printed in the *Shepherd*, I called tellurism. Your questions are so profound and pregnant with wisdom that I took upon myself the responsibility of laying them before the public. I should wish it was also in my power to answer them all to your satisfaction; but, alas! such is the pressure of circumstances, that my mind, willing as it is to expand itself in that sublime direction you intend to give to my labours, is incapable of doing justice to your claims.

Every man who has devoted himself conscientiously to a search after truth, comes often, as it were, to a point in which it becomes necessary for him to stop, and to look back to that point of departure from which he started.

This review of our journey, though highly interesting and instructive, is painful; indeed, often so painful as to bewilder one's mind. I am now occupied with this review; and there is something connected with it so deeply involving my inmost soul, that, under such circumstances, it is quite impossible for me to enter into any minute details of a doctrine, which undergoes, in the mind of the author himself, a new elaboration.

Whoever has listened with attention to my last lectures, must have perceived that, instead of dwelling simply upon the law of bipolarity, I was rising a step higher, and deduced this external law of nature, from a law internal, and above nature. In fact, the letters on tellurism were written with the intention of giving to the public the most visible and intellectual part of the science of nature. In this respect I feel that I have done my duty; yet another part, and the most important one, remains to be developed, namely, the invisible and divine. Your questions, my learned friend, are evidently directed to elicit from me my intuitions of the invisible and divine action of magnetism. *Hic opus, hic labor.*

In order that my readers may understand these questions, and be prepared for the answers, which will follow before the *Shepherd* takes leave of his flock, I must explain some words used by my learned friend. These words are natural centre, divine centre, the inversion of the cause, and its separation from the effect.

For instance, "Has not the natural centre a divine centre for his model?"

"The centre by the will, as a functionary, operates functionally; and these functional actions are called by various names, viz., hope, fear, pain, pleasure, happiness, misery."

"Are not all cures performed by the centre burning

out the cause, when the cause is, by a strong will, kept long enough at this holy fire?"

"Must not the cause be separated from the effect, and inverted, before the burning centre can get at it to overcome it?"

Now, gentle readers, you must know that the human being possesses two sets of instruments, which stand to each other in the relationship of polarity. These two are matter and mind, or sense and understanding. These poles are acting and reacting continually, and perform the functions of physical and intellectual life; they stand to each other like expansion and contraction, or gravity and attraction. But there is in the human being another element, of a higher mould; it lies in a centre, and is given to man as the ruler and guide of his whole being. This centre is the divine principle, which proceeds from the centre of the centre; and, when awakened, manifests itself into three different forms—will, conscience, and love, the latter being the most perfect. The centre of the centre is the supreme will, word, and love; which centre of the centre stands in the middle, and above the material and spiritual world, as the centre stands amidst and above sense and understanding, body, and soul, in man.

The centre of the centre acts continually upon the natural centre; but the two poles often counteract its action. Sense and understanding are continually at war with the centre; or rather, they are so constantly engaged in external pursuits, that they do not listen to the command of the internal ruler. From hence comes all which is called sin, or crime and disease.

The magnetiser is one whose natural centre, moved by the divine centre, exercises an influence over a man. This influence is nothing but a preparation, by which it disposes him whom he magnetises to free his natural centre from the obstructions of sense and intellect, and to give himself up to the centre of the centre. This preparation is nothing but to separate the cause, that is, the disharmony of the body and the mind, or the despotism of one of them, and to make the natural centre a focus of the divine centre.

This operation explains how the somnambulist, in his highest perfection, is gifted with powers superior to those of the most intelligent man, when in his watching state; because, if the magnetical operation brings about the untroubled relationship between the natural and divine centres, the knowledge of the somnambulist is not the work of man, but divine inspiration. It shows, likewise, how faith in the magnetised is requisite for the highest degrees of somnambulism. What is faith, but a loving, burning, relying of the natural centre upon the power emanating from the divine centre? When this love is already existing, the functionary intermediation of the magnetiser has no obstacle to remove. In this case, the magnetiser acts but as the instrument by which the divine centre changes the diseased substance into a prolific love substance.

In a few words, the whole work of magnetism, or tellurism, is a religious or magical work, and the magnetiser a magician; and the somnambulist is neither more nor less than an inspired seer.

THE ALPINE PHILOSOPHER.

ON MAN, PHENOMENALLY CONSIDERED.

1. The progressive man is to be made progressively into a real man.
2. Man, as man, a double being, is to be made by the creating spirit.
3. The creating spirit makes the double man, the real man, out of the animated inorganic elements.
4. So far as the double man is united to the *animated inorganic elements* and to the creating spirit, he is a double being, a real man.
5. The creating spirit, by the animated inorganic elements sustains the *double man*, and also the progressive man in his inward progressions.
6. Inward progressions are impossible without animated inorganic elements.
7. *Animated inorganic elements* are impossible without union, communion, and conjunction with the creating spirit, or unity.
8. As the animated organs do not make the animated inorganic elements, the animated inorganic elements do not depend on them for their existence and subsistence.
9. The double man is a progressive being, but his progressions are all of a celestial character.
10. The outward progressive man stands as a single flower.
11. The *inward* progressive man stands as a *double flower*.
12. The single flower is an instrument only, by which the double flower has been brought forth.
13. As the double flower is superior to the single flower, so is the double progressive man superior to the single progressive man.
14. The *animated organic* depends upon the animated inorganic, and both animation and elements depend on unity.
15. That which the animated organ *really* requires is to be found in the animated inorganic elements.
16. The *progressive man* must look within, and not without, if he desires to make a progress that will be permanent.

G.

QUIZZICUS IN A SERIOUS MOOD.

Oh! for the second-sight! but I'll be serious,
(That's if I can); I've laugh'd too much of late;
My mind has grown quite gloomy and mysterious,
By brooding over this, our mundane fate.
The streams of Helicon are deleterious
To those who have a highly flighty pate.
But in my lonely hour I love to drink,
And venture deep, and deeper from the brink.
My mercury is now at "spirit boils,"
And Kerner's "Diary" is my thermometer;
That spiritual gauge, from which recoils
The "rank materialist," with haggard air:
Progression is the instrument which foils,
And drives us like a lion or a bear
Right on before it at our utmost speed—
I almost wish I'd never learnt to read.
I then had been as stupid as an ass;
Indeed I am than Balaam's much more so!
He would not move beyond a certain pass,
When his stern rider dealt too harsh a blow:
He kick'd for justice—yet he dined on grass,
Or sea-weed (Erin hear!) but let it go;—
At length he prick'd his ears, and spurn'd the yoke:
Was it in *Erse* or *Irish* that he spoke?

It matters not, the tyrant was subdued;
And then he yielded, as all tyrants will,
When the roused serf assumes the attitude,
And his eye flashes the intent to kill;
Cruel as cowardly.—But I grow rude,
And write at random, with so little skill,
That—but we've got (Peace, hasten thy avater!)
Thank God and Toplis, a "PACIFICATOR!"

A world of wonders bursts upon the view!
A world of miracles arrests the sight!
A world of spirits through the ether-blue
Watches by day, and hovers round at night!
O Truth! thy paths are arduous to pursue;
Now near us—with us; then thy distant flight
Provokes our ardour; and, pursuing still,
We light upon a hillock, or a rill.

I had consign'd me wholly to the clod,
And coolly look'd on death as an event
Which all must one day meet; and thought the sod
Would cover, in *annihilation* pent,
Love, hatred, passion, sorrow: but, O God!
This last resort of wretchedness is rent
In twain, and there appears another life:
I'll pause an instant in this fearful strife!

"Almost a Christian"—more an Infidel;
I cannot *all* receive, nor yet deny:
I scorn the tales we hear of heaven and hell;
Nor will I advocate each priestly lie.
Our young convictions we can scarcely quell:
The deep impressions of my infancy
Rush at this moment back upon my heart,
Which beats, all stifling, as each string would part.

The love of life instinctive in the mind,
Here finds a *pabulum* to feed upon;
And though it be but of a dubious kind,
Too pure to analyse, nor sense can con
At present; yet, I doubt not, we shall find
A banquet, full and sumptuous, anon.
Aid us, Great Power that form'd! ("come wind,
come rack;")

Our hand is on the plough—we'll not turn back!

Aid us, ye shades of dear departed friends! I
Oh! is't your task to watch around the dying?
To soothe us as we hasten to our ends,
When the world from us like a scroll is flying,
In dark and dreary visions? Who attends
The new-born spirit, when, all lifeless lying,
Our bodies seem the counterpart of death?
Are we *most vital* when we yield our breath?

Again to meet the friends we loved in life;
To join them closer, in a sweeter land;
Emancipate from sublunary strife;
When, fetterless and free, we soar beyond
The precincts of our clay: the thought is rife
With ecstasy itself; endearing, fond
Emotion, burning, through the bosom flies,
'Till the hot tear boils over from our eyes!

Eternal being, love, and consciousness,
To revel in infinity of joy!
Then who would shudder at the dark recess—
The gate of pleasures that can never cloy?
"Mors janua vitæ!"* Yes, it must be; yes!
Here hail and tempest for a while annoy;
But there fruition shall embrace the whole.
I pant, I fly to reach the destined goal!

* Death is the gate of life.

Is there a heart so callous, that it never
Could feel affection's anguish at the hour
Which sunders all our sympathies for ever,
With a remorseless and un pitying power?
If such there be,—the storms of fate may loom;
The hurricane may blast; existence sever;
He's gone, unhonour'd, and without a sigh.
'Tis his misfortune that he *cannot die*!

Then through the flood of ages he must roam,
In lonely desolation; hopeless—lost!
Space cannot find the sordid wretch a home;
Himself his empire; driven, beaten, tost
On the wild surge of chaos; still to come
In contact with himself; from all divorced!
Than in a solitude like this to dwell—
The Manichean has no fiercer hell.

My brain is whirling in a sea of doubt;
My mind is tortured with conflicting cares;
I know not what to think; for every thought
Appears entrammell'd with a host of snares;
Still on they glide, as glides the silvery trout,
When the arch angler with his hook prepares
To drag him from his element, and rear
His fading beauties in the mid-way air.

QUIZZICUS

THE SEER OF PREVORST.

DEAR SHEPHERD,—The following passages from this singular work will relate to that "inward language" which this somnambulist not only spoke, but wrote, in a peculiar character, as I mentioned in my first letter. Previous to reporting them, I may be allowed to throw together a few observations, from my limited knowledge upon the subject, by way of introduction to the extraordinary facts detailed by her physician, Dr. Justinus Kerner.

We all remember the recent noise made about the "unknown tongue" which was spoken by the followers of the late Mr. Irving. If that uttered by the Seer of Prevorst should bear any analogy to it, it will at least be a curious coincidence. If, on the other hand, it should resemble that original language, concerning which the etymologists have made almost as much noise, it will be no less a matter of strange comparison. More recently, a popular reformer in ecclesiastical matters, Mr. Richard Carlile, has laid great stress upon the etymons of words, as explanatory of the origin of customs and ideas lost in the darkness of time. Be it so. The history of a word, to me, is as good evidence as any other history, only it must stand the same test as authentic history; there must be no query-work, no system-building about it. There is this difficulty, too, against our ready acceptance of any root of a word, that words must have been spoken long before any grammarian or lexicographer took note of their import and derivation. "In the beginning was the word, and the word was with God." So says revelation; and so said J. J. Rousseau, in his famous disquisition on the rise and progress of civilization, when he came to the conclusion that language must have been originally given by *inspiration* to man, otherwise he would have remained as inarticulate as the deaf and dumb of our day. Certain it is, that the affinities of language have been a puzzle to all etymologists. The evidences of one origin, whether external or internal, derivative or innate, are too convincing to permit a doubt of the unity of languages. Some have explained this identity in the elementary parts of words, by referring all languages to the

Hebrew stock; others have traced the source of this unknown river to the Sanscrit. Some antiquarians have contended for the originality of the Celtic; some for that of the Teutonic; and Bryant endeavours to crush the pretensions of both, by giving the pedigree of an imaginary language, spoken by an imaginary race, anterior to Celt and Goth; and lastly, Professor Murray outdid all his predecessors in this voyage of discovery, by making the five great primary languages—the Celtic, Gothic, Greek, Sarmatian, and Persic—remount to the single sound *ag*. This *ag*, according to him, was the Adam of speech; and *ag* had nine sons, *wag*, *bag*, *dag*, *gag*, *lag*, *mag*, *nag*, *rag*, and *sag*, who founded all the races of words in all the tongues that have been, or ever will be. So much for the *profane* historians, as they may be called, upon the origin of speech. Upon the whole, Professor Murray is perhaps the most learned and ingenious of them all, and has put it out of the power of any of his fellow-labourers to fling a stone at him, by the vastness of erudition which he has brought to his subject, and by the acute criticism which he has made of many parts of it. After his splendid and portentous vagary, the attempts of other dabblers in etymology appear to be the mere gabble of pigmies, the guesses of infants; and notwithstanding the new accessions made to this science, *ad libitum*, by the discoveries of the hieroglyphic characters, and the value of signs antecedent to all other written or graven records, it is possible that the rudiments of the common origin of languages will baffle all the attempts of the inductive philosophers, and remain, like revelation, a sealed book, till the word is made manifest by the spirit of truth.

We come now to another order of oracles upon the same head. In all ages the Mystics have maintained the virtue of certain terms and characters, which had no meaning for the vulgar world. Vico, in his *Scienza Nuova*, traced all language through three stages, which he called the divine, the heroic, and the vulgar. This seems to correspond with the division of Egyptian letters into hieroglyphic, hieratic, and demotic. The heroic and the vulgar tongues easily resolve themselves into poetry and prose, which in all languages still maintain distinct provinces to themselves. The divine language and scripture bore a character more or less intelligible, as mankind advanced towards or receded from the great epochs of illumination, which might be called the Augustan ages of revelation.

Even when the light had become dim, certain words retained a halo of ancient mystical meaning, and thence became used as charms, and forms of incantation, to conjure with. The saint, as well as the sibyl and sorcerer, exercised in the name of some mysterious power, and with the traditional formula of certain words. The alchemist, over his crucible, uttered sounds of unknown, and therefore terrific, import; and the astrologer heard a voice, and read a language in the stars, "a music in the spheres," which owed its value to the revelations of Magi, Chaldean sages, prophets, seers, or those whom, in modern phrase, we should call unconscious magnetists and somnambulists.

The Freemasons and Rosicrucians attempted to mechanise this sacred mystery of words and signs; but they only raised a scheme of jugglery and deception, incompatible with its divine nature. Jacob Boehmen and Swedenborg were both conscious that there were things in the interior world, with which they communed, that required a language other than the ordinary one to convey them. This caused them to search out and invent a whole series of terms, half unintelligible to their hearers;

and, indeed, all inventive genius, which represents one aspect of inspiration, has recourse to the same expedient. In this respect, children, whose life is a transition from the magnetic state to the solar life of intelligence, often outdo grown persons in their appropriation of certain sounds to express certain feelings within themselves, which terms they long retain, and reluctantly discard.

The declarations of somnambulists at length led enquirers to solve what appeared inexplicable in this use of language, as a means of incantation; and to account for the essays of infants, maniacs, and the deaf and dumb, to give utterance to an inward speech.

These declarations repeatedly affirmed that there was an inward nature, language; or mother-tongue, from which the somnambulists were obliged to translate whatever escaped from them in their soothsayings. Mayer's somnambulist assures us, that often these translations could not be depended on, particularly in matters relating to numbers, owing to the imperfection of common speech.

In the "Archives of Animal Magnetism," book viii., section 1., some samples are given of a peculiar "unknown tongue," by a somnambulist. *Ni monarto* is applied to the dog; *na blannaria*, the bride; *ni blinniochor*, the bridegroom; *na clemos*, the cat. *Clemor toni in diu aswinor*, meant, While I love thee, I quarrel with thee.

This, says Kerner, is nothing but the attempt to recover the lost language of the soul. His seer spoke this language so fluently, and so pertinently, that those around her learned to comprehend at last, though imperfectly, her meaning. It struck linguists as having an oriental sound and accent. She identified it with her feelings, and stated that every feeling had a separate word and sign, similar in that respect to the usual exclamations of joy, grief, pain, &c. A like language lay in every man's breast, and was marked with a cypher, which was its character; for every thing had its number, which number expressed its value, meaning, and all its various relations to other things and beings. "She did not think it with her head; it was from her heart it came, without any effort; it was the expression of her inward life. Therefore, names, and titles, and modes of address, such as 'you' instead of 'thou,' were incapable of utterance in it; she could only call things by their numbers or properties." Thus, she gave names to those about her, or to the beings of her interior spirit-world, which indicated their qualities. The name *Emelachan* conveyed the following poetical apostrophe:—"Thy spirit is calm and still, thy soul tender, thy flesh and blood hale!"

She was thoroughly consistent in her explanation of words, as often as called on for their meaning. Certain learned philologists desecrated Coptic, Hebrew, and Arabic prefixes and nouns, in the names she gave to objects. I cite a few of them for the inspection of our etymologists, and the initiated of the unknown tongue.

Bjat, the hand; *pi jogi*, the sheep; *Elshaddai*, the self-sufficing God; *handicadi*, physician; *abutana*, lady; *chlann*, smooth; *schmado*, moon; *nohin*, no; *nochianne*, nightingale; *bianna fina*, variegated flowers; *moi*, as; *toi*, what; *O pasqua non ti bjat*, *handicadi*? Wilt thou not give me thy hand, physician? *O mia criss*, I am; *O mia da*, I have; *girro danin chado*, one must remain there; *bona finto girro*, one must depart; *optini poga*, thou must sleep; *mo ti aralo*, I rest; *O minio pachadastin*, I am fallen asleep; *posi anin cotta*, the ring is full.

Elohim Majda Djonem—magic words which she wrote in an amulet. Several tables are given of written words, with and without their numbers; she contended that the number was holier than the sign, and gave a perfect sense of the thing signified. *Elshaddai*, without the number,

was simply God; with the number, it expressed his attributes, and illuminated the mind with a divine light.

She could not give a perfect alphabet of it; a single letter was frequently a whole word, and a number at the same time. Her physician often used the words, *optini paga*, as above, to set her asleep; he even obtained the same effect by folding them in a letter, and placing them upon her plexus unknown to her.

Here, then, is a cause for suspending our judgment as to all language being conventional, arbitrary, or derivative. The fact of a woman extemporising a language, however remote from copious, and uniformly applying the same term to the same idea, is unaccountable, on the supposition of its being a product of invention and memory; but here the language was both more copious and more expressive than the vulgar tongue of his country, and she had no retention, no power of refreshing her memory of it in her waking state: a glance, too, at the words will convince any tyro in languages that this spontaneous speech was totally removed from the genius of the German, her mother-tongue. It bears a Celtic character and construction, in opposition to the Teutonic idiom of her native dialect.

I know there is an easy way of solving this difficulty, by invalidating the testimony of Kerner, Eschenmayer, Gürrer, and the witnesses appealed to; but this is dishonouring human nature, and consequently one's-self. I prefer the explanation which the bipolar theory affords us of this phenomenon, and I leave these few guesses in the hands of the Shepherd and the Alpine Philosopher, for future development. May there not be a *universal* and an *individual* language? May not this double language correspond to the heart and the brain, and yet have one centre in common? May not the division of the poles be as follow:—

| Positive. | Negative. |
|------------------------|------------------------|
| Brain. | Plexus. |
| Conventional | Involuntary |
| Languages of the West. | Languages of the East. |
| Teutonic | Celtic |
| Lowland Dialects. | Highland Dialects. |
| Male. | Female. |

From the oscillatory movement of the poles, it would arise that the spontaneous or original would be continually acting upon and transfusing itself into the voluntary or individual language, as the divine will pours itself into the human will, and insensibly absorbs it. Hence the coincidence in the roots of all languages; they are dialects or deviations from one original, universal speech, which does not become universal by growth, as some surmise, but individual by corruption. It was and is from the beginning. The thirty years' dream of Leibnitz to discover or produce this universal tongue, by arranging language like a nomenclature of chemistry, to indicate the properties of things, was therefore absurd, because it was creating over again creation. A universal language needs not to be taught, it must be revealed, that is, brought from the inward to the outward. It coincides very well with the doctrine of universalism, to consider all the revelations, charms, and mystic use of language of the past, as mere individual types and partial miracles; and to admit a universal, divine, spontaneous language, which shall be spoken equally with the other sectarian dialects, when men are gathered into one fold, and informed by the spirit of all truth.—Yours,

NEBULA.

CONNEXION BETWEEN NATURAL AND REVEALED RELIGION.

(From Lord Brougham's Discourse.)

It may be proved, or allowed, that there is a God, though it be denied that he sent any message to man, through men or other intermediate agents; as indeed the Epicureans believed in the existence of the gods, but held them to keep wholly aloof from human affairs, leaving the world, physical as well as moral, to itself, without the least interference in its concerns. But Revelation cannot be true if Natural Religion is false, and cannot be demonstrated strictly by any argument, or established by any evidence, without proving or assuming the latter. A little attention to the subject will clearly prove this proposition.

Suppose it were shown by incontestable proofs that a messenger sent immediately from heaven had appeared on the earth; suppose, to make the case more strong against our argument, that this messenger arrived in our own days, nay appeared before our eyes, and showed his divine title to have his message believed, by performing miracles in our presence. No one can by possibility imagine a stronger case; for it excludes all arguments upon the weight or the fallibility of testimony; it assumes all the ordinary difficulties in the way of Revelation to be got over. Now even this strong evidence would not at all establish the truth of the doctrine promulgated by the messenger; for it would not show that the story he brought was worthy of belief in any one particular except his supernatural powers. These would be demonstrated by his working miracles. All the rest of his statement would rest on his assertion. But a being capable of working miracles might very well be capable of deceiving us. The possession of power does not of necessity exclude either fraud or malice. This messenger might come from an evil as well as from a good being; he might come from more beings than one; or he might come from one being of many existing in the universe. When Christianity was first promulgated, the miracles of Jesus were not denied by the ancients; but it was asserted that they came from evil beings, and that he was a magician. Such an explanation was consistent with the kind of belief to which the votaries of polytheism were accustomed. They were habitually credulous of miracles and of divine interpositions. But their argument was not at all unphilosophical. There is nothing whatever inconsistent in the power to work miracles being conferred upon a man or a minister by a supernatural being, who is either of limited power himself, or of great malignity, or who is one of many such beings. Yet it is certain that no means can be devised for attesting the supernatural agency of any one, except such a power of working miracles; therefore it is plain that no sufficient evidence can ever be given by direct Revelation alone in favour of the great truths of religion. The messenger in question might have power to work miracles without end, and yet it would remain unproved, either that God was omnipotent, and one, and benevolent; or that he destined his creatures to a future state, or that he had made them such as they are in their present state. All this might be true, indeed; but its truth would rest only on the messenger's assertion, and upon whatever internal evidence the nature of his communication afforded; and it might be false, without the least derogation to the truth of the fact that he came from a superior being, and possessed the power of suspending the laws of nature.

But the doctrines of the existence of a deity and of his attributes, which Natural Religion teaches, preclude

the possibility of such ambiguities, and remove all those difficulties. We thus learn that the Creator of the world is one and the same; and we come to know his attributes, not merely of power, which alone the direct communication by miracles could convey, but of wisdom and goodness. Built upon this foundation, the message of Revelation becomes at once unimpeachable and invaluable. It converts every inference of reason into certainty, and, above all, it communicates the Divine Being's intentions respecting our own lot, with a degree of precision which the inferences of Natural Theology very imperfectly possess. This, in truth, is the chief superiority of Revelation, and this is the praise justly given to the Gospel in sacred writ—not that it teaches the being and attributes of God, but that it brings life and immortality to light.

It deserves, however, to be remarked, in perfect consistency with the argument which has here been maintained, that no mere revelation, no direct message, however avouched by miraculous gifts, could prove the faithfulness of the promises held out by the messenger, excepting by the slight inference which the nature of the message might afford. The portion of his credentials which consisted of his miraculous powers could not prove it. For unless we had first ascertained the unity and the benevolence of the being that sent him, as those miracles only prove power, he might be sent to deceive us; and thus the hopes held out by him might be delusions. The doctrines of Natural Religion here come to our aid, and secure our belief to the messenger of one Being, whose goodness they have taught us to trust.

In other respects, the services of Natural Religion are far from inconsiderable, as subsidiary to, and co-operative with, the great help of Revelation. Thus, were our whole knowledge of the Deity drawn from Revelation, its foundation must become weaker and weaker as the distance in point of time increases from the actual interposition. Tradition, or the evidence of testimony, must of necessity be its only proof: for perpetual miracles must be wrought to give us evidence by our own senses. Now, a perpetual miracle is a contradiction in terms; [for the exception to, or suspension of, the laws of nature so often repeated would destroy the laws themselves, and with the laws the force of the exception or suspension. Upon testimony, then, all Revelation must rest. Every age but the one in which the miracles were wrought, and every country but the one that witnessed them—indeed, all the people of that country itself save those actually present—must receive the proofs which they afford of Divine interposition upon the testimony of eye-witnesses, and of those to whom eye-witnesses told it. Even if the miracles were exhibited before all the nations of one age, the next must believe upon the authority of tradition; and if we suppose the interposition to be repeated from time to time, each repetition would incalculably weaken its force, because the laws of nature, though not wholly destroyed, as they must be by a constant violation, would yet lose their prevailing force, and each exception would become a slighter proof of supernatural agency. It is far otherwise with the proofs of Natural Religion; repetition only strengthens and extends them. We are by no means affirming that Revelation would lose its sanction by lapse of time, as long as it had the perpetually new and living evidence of Natural Religion to support it. We are only showing the use of that evidence to Revelation by examining the inevitable consequences of its entire removal, and seeing how ill-supported the truths of Revelation would be, if the prop were withdrawn which they borrow from

Natural Theology; for then they would rest upon tradition alone.

In truth, it is with Natural Religion as with many of the greatest blessings of our sublunary lot: they are so common, so habitually present to and enjoyed by us, that we become insensible of their value, and only estimate them aright when we lose them, or fancy them lost. Accustomed to handle the truths of Revelation in connexion with, and in addition to, those of Natural Theology, and never having experienced any state of mind in which we were without the latter, we forget how essential they are to the former. As we are wont to forget the existence of the air we constantly breathe, until put in mind of it by some violent change threatening suffocation, so it requires a violent fit of abstraction, to figure to ourselves the state of our belief in Revelation were the lights of natural religion withdrawn. The existence and attributes of a God are so familiarly proved by every thing around us, that we can hardly picture to ourselves the state of our belief in this great truth, if we only knew it by the testimony borne to miracles, which, however authentic, were yet wrought in a remote age and distant region.

The use of Natural Theology to the believer in Revelation is equally remarkable in keeping alive the feelings of piety and devotion. As this topic has occurred under a former head, it is only to be presented here in close connexion with Revealed Religion. It may be observed, then, that even the inspired penmen have constant recourse to the views which are derived from the contemplation of nature when they would exalt the Deity by a description of his attributes, or inculcate sentiments of devotion towards him. "How excellent," says the Psalmist, "is thy name in all the earth! thou hast set thy glory above the heavens. I will consider the heavens, even the work of thy fingers; the moon and the stars which thou hast ordained." See also that singularly beautiful poem the 139th Psalm; and the Book of Job, from the 38th to the 41st chapter.

It is remarkable how little is to be found of particularity and precision in any thing that has been revealed to us respecting the nature of the Godhead. For the wisest purposes it has pleased Providence to veil in awful mystery almost all the attributes of the Ancient of Days beyond what natural reason teaches. By direct interposition, through miraculous agency, we become acquainted with his will, and are made more certain of his existence; but his peculiar attributes are nearly the same in the volume of nature and in that of his revealed word.

As we profess to belong to no party, and to every party in existence, we must, in accordance with our principles, give a little nourishment to all. Both the mystic and the materialist are our brethren, partaking of our common nature, and possessing a claim upon our sympathy and our indulgence, to which we cordially subscribe in the spirit of universal charity. There are some peculiarities in which they never can agree, because their organizations are different; and therefore we do not expect the mystic to unclothe himself of his mysticity, or the materialist of his materiality; but by introducing the two to each other, as the friends of genuine liberty, and the enemies of all *formal* religion and hypocrisy, we may at least strengthen the hands of the vanguard of progress, and expand the views of both, by embracing the whole field of human thought in our system of instruction. This is our apology for articles which may not suit the intellectual appetites of some.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 43.]

SATURDAY, JUNE 20, 1835.

[Price 1d.]

SYSTEM OF NATURE.

WE shall bring forward a few more of the great subjects of religions, as we did last week, and show that they are all both true and false; that is, they contain a positive and a negative principle, which can find analogous proofs and illustrations in its support throughout the whole sphere of nature. Therefore, all men are justified in, and have good reasons for, their respective creeds, and we have equally good reasons for receiving them all and rejecting them all. They neutralize each other in the moral, sentient, and divine principle of love, which employs intellect merely as a menial servant to cater for its pleasures. God is love, and nothing ever can be truly beneficial to the species at large, which has not love for its source, and love for its object. Truth, error, wisdom, and ignorance, are all alike elements of nature, are equally useful in their place, and are only to be valued by the amount of pure happiness which they communicate to the moral and sentient being. In a perfect being there is neither truth nor error, knowledge nor ignorance, but something which partakes of the attributes of both.

SIN.

There is a difference in moral actions, which distinguishes them by the two genuine epithets of good and evil; the good being that which communicates happiness, the evil that which destroys it; consequently, *sin is moral evil*.

But if obedience to any given precept were strictly and religiously performed by man, there never could be any progress in society, for it is only from resistance or disobedience that the intellectual and moral growth of the species proceeds. What is the duty of man in one stage of progress is not his duty in another; and the spirit of rebellion destroys the old law by refusing to keep it; and thus reformation proceeds by the spirit of disobedience; but the spirit of disobedience is sin; *sin, therefore, is not moral evil, but the spirit of progression in man.*

THE WILL OF GOD.

Every thing that takes place is according to the will of God; which makes the proposition amount to the very something as saying that God has no will at all, that is, no will in man distinct from the will of man himself; for whatever God wills he makes man do, either willingly or unwillingly, whether it be a work of mercy or of judgment.

Moral evil is *contrary to the will of God*, inasmuch as God is the personification of moral good, to which moral evil is at present opposed, although it ultimately leads to it. Some are further in advance in moral good than

others, and those are better men, more divine, inasmuch as they effect more immediate good. Of such it *may be vulgarly said*, they act more in conformity to the Divine will than other men. The saying, however, is not literally true, for we can easily suppose a case in which a murderer may effect more general good to society than a gentler and more amiable character.

JUSTICE OF GOD.

This is an axiom which needs no proof. If a man is not just to himself, he must be a regular fool. The justice of God is merely the equilibrium or harmony of nature; his own repose and tranquillity of mind: we are all members of his body.

But nothing can be more unjust than God. He is the *beau-ideal* of injustice, for he contains the infinitely great and the infinitely little in himself, and has created the greatest conceivable distinctions in organized beings, making some infinitely weak, and stupid, and helpless; whilst he has clothed others with mental and physical energies of indefinite extent. Besides, if God is not unjust, who else can be so? We all live and breathe in him, and can inherit nothing but his universal nature. We are all sprigs of one common stock. Injustice is the *soul* of action; nature would be a dead calm without it. It is a splendid moral attribute of God, which the priests of the old world have never had the wit to discover. The fear of the devil blinds one eye, and they see but dimly with the other. Thus the spirit of prophecy speaks of the priesthood in a body, personified by the name of an idol shepherd: "Wo to the idol shepherd that leaveth the flock: the sword shall be on his arm (one arm) and his right eye: his arm shall be clean dried up, and his right eye shall be utterly darkened," Zech. ii. 17.

WISDOM OF GOD.

Self-evident also, inasmuch as all natural action, universal and particular laws, are merely operations of his will, and workings of his power.

But if God were not infinitely ignorant also, how could he exist? How could he act? What could he act upon? His body must be as infinitely ignorant as his mind is infinitely wise. Matter is this negative or passive principle, the incorporation of ignorance, and a valuable and indispensable attribute of God. We might even show the necessity of a spiritual ignorance in God, but we do not wish to go too deep; at the same time we insist upon his omniscience, that is, perfect consciousness of every, the minutest, movement in nature.

ELECTION AND REPROBATION.

All Nature is full of this twofold system, and it is folly

to argue about the justice or injustice of it: it is both justice and injustice, or neither. It cannot be otherwise; we cannot imagine it otherwise. We cannot all do the same work, or personify the same principles. Some must act the honourable, and others the dishonourable; some the wise, others the foolish; some the high, others the low; some the social, and others the unsocial parts; some must be men, and others must be brutes; and if there were not this unequal, arbitrary, elective, and reprobative distribution of the material of the universe, pray what would the universe be? "Hath not the potter power over the clay of the same lump, to make one vessel unto honour, and another unto dishonour?" Who but a fool would dispute this truism? Yet nothing can be more unjust. It is the very essence of injustice, or the quintessence, if that is stronger.

But is it true what the priests say about election and reprobation? That is a different thing. If the Christian priests, like the Jewish priests of old, have mistaken a mere temporary and individual type for a great natural or universal principle, they have done so because they were blinded for the time being; but they have had their day, and a new move is begun; a more liberal and universal system of interpretation is suggested to the human mind, and will grow with the growth of youth. What the priest applies to the individual, is only true of the universal. There is a good and bad in every man; the bad is cursed, the good is blessed; the old man of the heart goes to hell, and the new man of the heart goes to heaven; so that every man is damned, because every man is wicked; and every man is saved, because no man is wicked: he is just as God made him, and God has borne the sins of us all. "Cast your burden on the Lord," pilgrim; do not be such a fool as to carry your own sins about with you, when Christ has promised to bear them all. What a fool you must be to acknowledge yourself a debtor, when your friend has paid all your debts. You are free, you simpleton; and if you have not the sense to see your freedom, you must just become a slave.

"There is a hell; there is no hell." If you don't understand that contradiction, you have not read the *Shepherd* carefully.

You may say it is nonsense to talk so. So it is; all nonsense; and what is nature but a mass of nonsense, which you cannot comprehend? But there is no greater nonsense than the thing you understand, or think you understand. Did you ever know a good fellow, who was not a bad fellow: and did you ever know a bad fellow, who was not a good fellow? What a fool the *Shepherd* must be to talk so! The *Shepherd* is a fool, and thanks God for it; as an Apostle has said, "We must become fools that we may be wise," "for the wisdom of man is foolishness with God."

CAUSE AND EFFECT.

There is no such thing as exclusive cause and effect, because every thing is cause and effect. What a mass of confusion theologians and infidels have bewildered their brains withal about those two words! The theologian wants to represent God as a cause only, and not an effect also, always looking with one eye, because the other is utterly darkened. The infidel bewilders himself and others,

by inferring, first, from the circumstance of the eternal succession of cause and effect, that there is no first cause, and then, as a corollary, that there is no God. What a splendid discovery! how consoling! Neither of them ever conceived the very simple fact, that God is both cause and effect, both positive and negative. Hume and other infidels say, that because one thing follows another regularly, we have no right to conclude that the one is the cause of the other; thus night regularly follows day, but day is not the cause of night. This has been accounted a witty argument. But neither Hume nor any of his school, nor of the school of the priests, notwithstanding all their logic, ever imagined the simple fact (or, if they did, neglected to reason upon it) that there are two kinds of causes, a positive and a negative, and that day is the negative cause of night, for it causes night by disappearing.

Cause is always double, and effect is single, being the product; therefore cause and effect have a threefold being. No power in nature acts singly; it has a mutual action with another active or passive power, and these two produce an effect. These three are one. The effect is the last, and is the emblem of rest, or the consummation.

Effects are merely particular causes begotten of the universal cause, and begetting other causes in succession; so that all nature is a cause, and all nature is an effect; or neither cause nor effect, for the two neutralize each other. God is the first and last cause, and the first and last effect; but there is no first cause, for there is no beginning; and no last effect, for there can be no end. If you don't understand this, it is because it is unintelligible, as all sound universal principles are. Ignorance is our common mother.

RIGHT AND WRONG.

Every thing is right, because it belongs to nature.

Every thing is wrong, because it has a successor. That which is right for a time is not necessarily right for ever, and when its work is done it becomes a nuisance.

Truth is very good, and so is deception. Could you play a game at chess without the latter? All the interest of the game consists in deceiving your opponent. And what is social intercourse but a game?—only let us make it as innocent as possible. Deception is only evil when it is employed to create personal misery. The same may be said of error; it is a necessary element of nature. Let the saints and the perfectibilians talk as they may about truth and its relatives, life is of no worth, either here or hereafter, without a little mixture of error and deception. They are like wine and spirits, good in moderation, destructive only when taken in excess. Then we may tell as many lies as we please? If you do tell lies, then nobody will believe you when you tell the truth. There is nothing more detestable than lying. Public opinion determines the points upon which you may deceive or conceal the truth. Do not deviate much from this moral standard: it will become purer as the education of man progresses. But if you have a very fastidious conscience, by all means follow it. A conscientious man is an honourable man. If your conscience be very nice about certain forms and modes of conduct, sanctioned by general practice, then the Devil will tease you

for your over-righteousness; and if your conscience is not nice in respect to the moral duties you owe to your neighbour, then God will tease and punish you. There are fools on both sides of the question.

THE SHEPHERD.

ON MENTAL DISEASES.

"Remember, I deceive thee not,
Nor have I tempted thee;
Thou comest of thy own accord,
And actest knowingly."

Satan, in Southey's "All for Love."

It is upon madness again that I write,—a pretty subject for one who must devote the midnight hours to literary gallopades. Perhaps the author of these lines may soon afford a new specimen of insanity, namely, the midnight-writing monomania, for I feel that his brain begins to turn topsy-turvy. Wherefore, before the evolution be completed, it is needful to have done with his letters on mental diseases.

The demonomania, or the possession with evil spirits, is the subject with which I intend to amuse my readers. In order to understand this kind of disorder, we must try to make ourselves acquainted with the devil.

The devil is a name which has a great many significations; it signifies now something good, now something bad. If a woman has a piercing tongue, and an ill temper, you call her a devil-incarnate; a good devil means an honest fellow; if a woman be very fine, some exclaim, "A devilish fine piece of womankind!" I have seen a whole sheet of caricatures of the devil, and have read a large octavo volume containing his history. Luther, the great reformer, was plagued by the devil. Sometimes he expelled him from his presence by singing some hymns; and once, whilst translating the Scriptures, and the arch-fiend appearing before him to disturb his work, the holy man became in such a passion, that he took up his inkstand and threw it at the devil; the traveller who visits the Wartburg, is shown by the castellan the marks of ink that was spilt in that memorable battle. The devil appeared in the form of a snake to seduce the first woman; and he has often assumed the form of a woman to seduce men. A devil having committed some offence against the laws of the infernal kingdom, was condemned to assume the figure of a man, and get a wife. This daughter of Eve so completely played the devil with the devil, that he flew back in despair to his master, and would rather suffer any other punishment than that of matrimonial broils. The worshippers of the devil are many, because he is the father of three things of which mankind are so fond, namely, gold, pride, and deception. The devils, however, have some degree of honesty; you can safely make a compact with them, and if you are cheated in the bargain it is your own fault.

Once a poor fellow wished to have some money from the devil; and he obtained it under one of these three conditions: to seduce his neighbour's wife, to kill his neighbour, or to get himself drunk. The man chose and performed the last condition. He got drunk; whilst in

liquor he seduced his neighbour's wife; the neighbour unfortunately popped in at an unlucky moment, and the drunkard took a knife and stabbed him. This fragment from the history of the devil ought to be prefixed to all the programmes of the temperance societies. Silk B. could make a great fuss with it.

The devils are also fond of fun; they were the first inventors of the social festivals. On certain days, or rather on certain nights, they assemble in certain places, and drink and dance, and make love with the fair ones, nearly in the same way as it is done at our festivals. They like to promote the expansion of feelings as well as any modern philanthropist. A beautiful description of such festivals is to be found in Shelley's posthumous works, translated from the original German of Goëthe.

Now, having given some illustrations of the nature of the devil, the reader may easily comprehend the term of demonomania, or possession of the devil.

There are people who think that some devil has entered their bodies, and makes them laugh, cry, jump, fall into fits, mew, bellow, roar, strike blows, and scratch, against their own will.

It is possible that in some cases the devil really plays such tricks upon mankind; at least the fact of people having really been possessed with the devil, is borne out by as many and as substantial evidences as any other historical fact. But in most cases the disease is a mental one.

The St. John's-wort (*Hypericon perforat*) was formerly employed against this disease, and it seems to have been as efficacious against the devil as the white ash against the rattle-snake; hence it was called *fuga demonum*.

But the most powerful specific against the possession of evil spirits is the exorcism; the exorcism is, however, nothing but a form of spiritual magnetism, or tellurism. I have seen, in different sanctuaries, the most dreadful cases of demonomania perfectly cured by exorcism.

Generally, the patient is brought bound before the priest, and as soon as he is sprinkled with holy water, he falls to the ground shrieking or howling, and remains so until the prayers are over. Sometimes they become furious towards the end, and dart upon the people around them. I have seen at Loretto some break the strongest cords; after a while they became appeased, and went away cured.

The demonomania occurs chiefly at the age of puberty, and is more frequent in hot countries than in temperate ones; it often ends fatally, by causing patients to jump from windows, or even dash their brains out against rocks or walls. It has been treated medicinally by cathartics, emetics, and the antiphlogistic and revulsive methods; also by tonics and narcotics: all these remedies have given but temporary relief. The exorcism, however, by acting psychologically and magically, or rather theologically, seems to be the most appropriate form of treatment. Once, when at Einsiedeln, in Switzerland, I witnessed the cure of a female who was possessed of seven devils: the poor woman was no deceiver. I magnetised her before she went to be exorcised, and at

each stroke of the hand, though I did not even touch her skin, she screamed out like an eagle; after a few minutes she began to howl, then to roar, and, in short, to make seven different noises, all distinct from her natural voice; some of these voices had actually something of the terrible. She was cured in three days, after which she remained a whole week to do penance, that is; to pray, to fast, and to confess. She left the sanctuary perfectly cured. She had been transported from a distant part of the continent (the boundaries of Silesia).

I have no doubt that such diseases occur in this country, but are confounded with the cases of ordinary rage, and consequently must end fatally.

THE ALPINE PHILOSOPHER.

MORAL AND INTELLECTUAL EDUCATION CONTRASTED.

A JUST arrangement of moral duties and intellectual phenomena is a highly important desideratum, especially with reference to education. We all feel that their pretended expounders have encircled them with much obscurity of language, and that their confidence in rectitude rests more upon hope than on fact. This obscurity must not deter investigation; this hope must not withhold assent to unpleasant truths. If we have been standing on words, let them be abandoned for the real cause.

Nowhere is there discoverable good evidence of a moral result from mere intellectual culture; on the contrary, there is abundant proof that howsoever highly the vicious propensities are refined and modified by individual cultivation, or by the general social advance, they still exist, and with a force no less destructive, within and without, than society's rougher forms exhibit. Notwithstanding this fact, education is most powerfully, and almost solely, urged with genuine, spontaneous warmth, by men who assert that moral duties and religious love will evolve from intellectual instruction. Of course, this opinion is not entirely unsupported by reason, though it is by dutiful moral experience. Truly it is said that youth, when employed in useful learning, cannot then be also engaged in any bad pursuit; but, even if minds could be always so occupied, which is impossible, there would be no dutiful moral phenomena, and scarcely any moral or religious love; and no less could be claimed for dancing, or other mechanical means of filling vacuity.

A two-fold difficulty obstructs the admission of the truth in human consciousness, which must, however, be admitted in all its relations, with all its force, and with a calm submission to its consequences, though destruction of our prided doctrines and much-loved theories be some of those consequences. First, every one does not perceive, or, perceiving, does not acknowledge, that the moral and intellectual portions of man's interior nature are as *separable* as are his eyes and his legs in his exterior nature; not that they are entirely distinct and *separate*, like two individuals, but that they are, as it were, two different limbs of his interior self. The confounding of these two natures makes men hope that instructing one is cultivating the other; which is like hoping that a good dancer would, as a consequence, certainly be a good writer or reader.

The other branch of the difficulty is, that men who perceive and assert that moral duties and intellectual operations are two, have equal dependence with the former on the power of theoretic instruction, or outward moral precept, in place of inward moral influence. Having, also, no confidence in any profession of opinions not exactly similar to their own—and mere moral opinions, creeds, and forms of words having as little conjunction with moral duties as any other scientific theories have—an active, living, moral spirit, within the human being, is never remembered, never awakened, never rightly looked for in education.

Hence, then, we see that two grand admissions are necessary by the friends of education; admissions not merely in theory, but to be by love put in practice, before the opponents of education can be allowed to say that education is no bar to vice. These are the existence of a moral, active spirit in man, and the active, living, energetic, generating nature of all his interior powers. As this spirit and these powers are encircled by just educative conditions, as opposed to instructive means, the human being approximates perfection. As the exercise of the intellect in light has, in our time, brought about an age of physical science, so the exercise of the feelings in love will, as soon as these acknowledgements practically exist, create the age of moral sensibility or moral dutifulness.

This is the shortest statement the case is susceptible of; but argumentative minds will require proofs of these phenomena, and a discussion of the practical measures.

To prove there is a moral substance in the human being, it is sufficient (to me at least) that he can knowingly do wrong. This power is not intellect, but distinct from it; if intellectual eminence had even generally secured moral duty, we should not now be talking of it. The next point is, that this spirit is vital, the cause of human life, human life itself; and here, indeed, is, unfortunately, room for much debate.

Modern philosophy, snatching a leaf from Locke's Essay on the Human Understanding, not only declares that it possesses the whole book, but that it takes cognizance of man's whole metaphysical life, and asserts that the human mind is a *tabula rasa*, a blank surface, on which may be written any characters, sentiments, principles, opinions, &c., that the writer pleases. This is equally a libel upon Locke, and upon the spirit, though Locke be as wrong as his pretended followers. Why should we deny to humanity an exhibition of the acting power, whose existence we perceive and acknowledge in the lowest animal and vegetable forms? Is it merely because it comes out last? The grain of seed depends for its formal development on mineral productions; but we do not, therefore, call it a mineral. The animal form depends in like manner on the vegetable and mineral worlds; yet we distinguish the form from what it depends on, and can perceive its life to have another, and, with respect to its form and to them, an independent existence. At the same time, we can allow many deteriorating modifications to the circumstances by which the individual is surrounded. But here our perception ceases. Philosophy will not let us perceive that our in-

ternal powers need, and, needing, have a real life, as much as the vegetable seed, or as the bird's egg, which outer influences merely develop and slightly modify, but can never create or generically alter. If the seed be barley, the crop must be barley; if the egg be a wren, so must the bird.

Because circumstances possess a destructive power, they have not necessarily a creating power. The various phenomena arise from the various internal activities, not from the various outward circumstances. No outward circumstances can make seed-barley produce a wheat crop, though they may modify the barley favourably or unfavourably. This analogy, we affirm, holds good, as far as such illustration can, of the human mind. Living, intellectual, and moral germs are there, not as blank spaces, but actual life, more or less developed, as internal conditions have been more or less complied with, forming an education more or less successful. But education is not likely to succeed at all, while educators consider pupils as passive objects, or confound those powers which should be kept distinct. Were pupils treated as active subjects, their higher internal powers would be clearly worked out, and their inferior powers would be harmonized instruments.

But how does this prove your case? Not at all, we reply. It is not in human power to prove an elementary truth; and this, we assert, is the point from which the rational courser should start. We have, therefore, endeavoured to illustrate, and not to prove. Moral life must be proved in like manner as vegetable life. He who doubts, must try; he who has faith, will try. If the farmer had not faith in his seed-corn's life, we should starve next year. Having no faith in human moral life, we are famishing for a supply of moral sympathy.

It would appear, then, that the object has been missed, either because it has not been aimed at, or not aimed at properly; not because there is no object. In the family circle fewer obstructions exist; but how public seminaries should be conducted has not yet been satisfactorily shown. Vague professions, indeed, are common enough; an attention to moral duties is guaranteed in a postscript to every school prospectus.

When the parent commits his child to the guardianship of an intellectual teacher, without making provision for a dutiful moral culture, the moral wants of the child not being met by a proper sphere of development, the faculties run to excess in an improper direction. He comes forth from the academy well instructed, ill educated; extensively intellectual, highly vicious. The parent marvels at the blunder, without seeing with whom it began. The only remedy yet extensively proposed is religious teaching, in the manner of precept or lectures, which are as unsuited to supplying moral food as are scientific intellectual theories. Not precept, not the regular lecture, not abstractorial instruction, however eloquent, can ever become to the youthful mind attractive elements, favourable to the growth of the living moral spirit. All the variety of social moral duties must actually exist as magnetic influences surrounding that spirit, before a favourable result can be anticipated. Whether all or few duties are performed, the precept, the oral and

theoretic instruction, must, if any good is to be done, follow or accompany, not precede, the social moral duties. If the method of teaching by objects be advantageous, as it doubtless is, in intellectual development, how much more is it necessary to be quite sure that the moral duties have been or are present to the moral perceptions, considering that to the teacher the signs only of its presence to the pupil are visible! As, even in such case, he is liable to err, how much worse than useless is a method totally abstracted from the dutiful realities in the youthful bosom!

C. L.

THE SOLAR SYSTEM.

(Continued from No. 10.)

In the tenth number of the *Shepherd* we treated of the symbolical character of the Solar System, and promised to finish the illustration in respect to the eighteen satellites of the primary planets. By referring to No. 10, page 75, our readers will discover what use we made of the seven primary planets and four asteroids that move between Jupiter and Mars. The whole planetary system is divided into three parts. These parts have a most minute correspondence with our threefold division of nature, the physical, intellectual, and moral. The outer, consisting of three planets, being the region of greatest darkness and greatest physical power, represents the *physical*; the middle, consisting of four, representing the spiritual and intellectual; and the Sun, being unity, representing the moral, the beginning and the end of all progress, the first and the last.

The *physical* is the greatest *brute* of the three, and therefore is very properly designated in scriptural or prophetic language by the appellation of "the beast." The spiritual department is, however, its bride, its other half, and the two together make up "the beast." As, however, a woman generally goes by the name of her husband, her own individuality being absorbed in the individuality of the male, we have good reason to look for all the peculiarities of the creature called "the beast" in the outermost or physical department.

The beast, according to the old Jewish prophets, has seven heads and ten horns. This emblem is easily discernible in the outer department of the planetary system, without any straining of the imagination to make it out. Saturn, the middle planet, has seven satellites, corresponding to the seven heads; and on each side of the seven heads we have ten horns, four belonging to Jupiter, and six belonging to Uranus, or Herschell. But we are told in Daniel, that the beast has an eleventh horn, which is not enumerated with the ten. This we find in the Moon of our Earth, which does not belong to the outer division, but yet belongs to the twofold married system. This also represents the eighth head, which is of the seven, but not counted with them; in other words, is the bride, who has an individuality of her own, which is nominally absorbed in that of her husband. The figure is as perfect as it is possible even to conceive it represented in this symbolical manner by balls of solid matter and separate existence. We have even attempted to imagine a more perfect model, but cannot; and when we consider that this beast with the seven heads and the ten

horns is the best possible symbol of the human being itself, we obtain a very wonderful and interesting lesson in the first principles of divine astrology, or the correspondence that subsists between the organizations of Nature on the wide and extensive scale of the heavens themselves, and those which are confined to smaller dimensions of animal existence. The seven heads of man are his seven senses. There are, properly speaking, only three senses, namely, feeling, seeing, and hearing; the other four, like the four secondary or compound colours of the rainbow, being modifications, or mere duplicates. The two eyes and two ears are duplicates, and taste and smell are modifications of feeling. The senses are very properly called heads, inasmuch as they are the organs of perception. The ten fingers are very properly denominated horns, as instruments of external action for the heads. The toes are a duplicate of this figure, and consequently the beast is represented double. Daniel expressly says that the ten toes are the ten horns of the beast.

We have drawn out this figure in the most simple and unostentatious manner possible, not to offend the delicate nervous sensations of many of our sceptical readers, but we are very far from having exhausted the subject; in fact it is capable of such demonstration as must convince all but pure idiots of the perfect systematic harmony that pervades the universe, and that this harmony has been revealed unknown to man in former ages, in the dark mysteries of prophecy. Some of our chaotic gentlemen, we know, unwilling to admit the slightest symptoms of design, plan, providence, foresight, or any other thing but their darling chance and ineffable confusion, will no doubt endeavour to evade the force of this argument by maintaining that the ancients were acquainted with the number of the primary planets and satellites; that telescopes were known to the Druids, because these wizards were peepers, and looked through tubes to distant objects. They will even, for the sake of getting out of a scrape, maintain that the ancients were much more conversant with all the modern discoveries of science than we ourselves are in the nineteenth century; but by some unaccountable circumstances, every trace and remembrance of this science are obliterated, and not even a plausible ground for conjecture is left, except in the scepticism of prepossessed and imbecile minds, who have resolved not to move one step out of their favourite system of "universal death," though time and space should throng with demonstrations of its folly.

THE VAGUENESS OF LAW.

IN seeking to attain the same object, they (the judges) frequently do, and of necessity must, from the variety of opinions which must be found in different men, pursue very different courses. The same benevolence and humanity, understood in a more confined or a more enlarged sense, will determine one judge to pardon and another to punish. It has often happened, that the very same circumstance which is considered by one judge as matter of extenuation, is deemed by another a high aggravation of the crime. The former good character of the delinquent, his having come into a country in which he was a stran-

ger to commit the offence, the frequency or the novelty of the crime, are all circumstances which have been upon some occasions considered by different judges in those opposite lights.

The facility with which a theft could be committed, is with him who looks merely at the moral conduct of the individual matter of extenuation; he sees in the offender only a man who had not vigour of mind to resist a very strong temptation; but to those, who consider the interests of the public, it may appear that it is only by a severe execution of the law, that such temptations can be overcome, and that this very circumstance, therefore, furnishes a reason against relaxing the severity of the law. Is the offender young, his youth awakens compassion; "a lenient punishment perhaps may reclaim him," is the observation of one man; while another exclaims, "if so early he has reached such a pitch of depravity, what enormities may not be expected from him as he advances further in life! Compassion to him would be cruelty to the public." The prisoner was intoxicated when he committed the offence: and not being at the time in possession of his reason, Titius thinks that it would be unjust to call him to a rigid account, and to exert much severity of punishment; while Sempronius sees in his drunkenness only a two-fold offence, and an additional reason for severity. It was his first offence; till the moment when he committed it he had led a life of labour and industry; and his past good conduct affords in the judgment of Micio ground to forgive a single transgression; but Damea upon these very habits of the culprit's former life rests his condemnation: he was not a man without resources, and forced, as it were, because he could find no employment, to live on the plunder of the public; but having the means of exercising honest industry, he has, without necessity, without temptation, and therefore without the possibility of excuse, plunged into guilt.

It is not merely particular circumstances attending the crime, it is the crime itself, which different judges sometimes consider in quite different points of view.

Not a great many years ago, upon the Norfolk circuit, a larceny was committed by two men in a poultry yard, but only one of them was apprehended: the other having escaped into a distant part of the country, had eluded all pursuit. At the next assizes, the apprehended thief was tried and convicted; but Lord Loughborough, before whom he was tried, thinking the offence a very slight one, sentenced him only to a few months' imprisonment. The news of this sentence having reached the accomplice in his retreat, he immediately returned, and surrendered himself to take his trial at the next assizes. The next assizes came; but, unfortunately for the prisoner, it was a different judge who presided; and still more unfortunately, Mr. Justice Gould, who happened to be the judge, though of a very mild and indulgent disposition, had observed, or thought he had observed, that men who had set out with stealing fowls, generally end by committing the most atrocious crimes; and building a sort of system upon this observation, had made it a rule to punish this offence with very great severity; and he accordingly, to the great astonishment of this unhappy man, sentenced him to be transported. While one was taking his departure for Botany Bay, the term of the other's imprisonment had expired; and what must have been the notions which that little public, who witnessed and compared these two examples, formed of our system of criminal jurisprudence?

Between these two cases no distinction could be, or was attempted to be taken, either in the circumstances which attended the commission of the crime, or in the

character or past conduct of the criminal. The wide difference in the punishments inflicted, proceeded entirely from the different opinions which the two judges had formed of the nature and tendency of the crime; and if the opinions of judges can vary so essentially upon the character of the crime itself, what inconsistent and conflicting judgments must they not necessarily often form upon that variety of circumstances in the criminal act, or in the character and life of the offender, upon which the extending or withholding of mercy is to depend!

The truth is, that in this uncertain administration of justice, not only different judges act upon different principles, but the same judge, under the same circumstances, acts differently at different times. It has been observed, that in the exercise of this judicial discretion, judges, soon after their promotion, are generally inclined to great lenity; and that their practical principles alter, or, as it is commonly expressed, they become more severe as they become more habituated to investigate the details of human misery and human depravity.

Let us only reflect how all these fluctuations of opinion and variations in practice must operate upon that portion of mankind, who are rendered obedient to the law only by the terror of punishment. After giving full weight to all the chances of complete impunity which they can suggest to their minds, they have besides to calculate upon the probabilities which there are, after conviction, of their escaping a severe punishment; to speculate upon what judge will go the circuit, and upon the prospect of its being one of those who have been recently elevated to the bench.—*Bentham*.

OF THE "SYSTÈME DE LA NATURE," AND THE HYPOTHESIS OF MATERIALISM.

THERE is no book of an atheistical description which has ever made a greater impression than the famous *Système de la Nature*. It bears the impression of London, 1780, but was manifestly printed in France; also, it purports to be written by Mirabaud, secretary of the Académie Française; and in a prefatory advertisement by the supposed editor, who pronounces a great panegyric upon the work, enough appears to engender doubts of Mirabaud having been its author. He died in 1760; and it was twenty years before the work appeared—found, says the writer, among a collection of manuscripts made by a "*savant curieux de rassembler de productions de ce genre*." Robinet, the author of another work of similar tendency, called *De la Nature*, has been at different times said to be its author, without any proof, or indeed probability; but the general opinion now ascribes it to the Baron d'Holbach, aided, in all probability, by Diderot, Helvetius, and other members of the free-thinking society, who frequented the Baron's house, and who used to complain of Voltaire's excess of religious principle, not unfrequently ridiculing him for his fanaticism. Mirabaud, upon whom this publication most unjustifiably charges the book, by placing his name in the title-page without any doubt expressed, and reserving the doubts for the preface, was a man of unimpeachable integrity and amiable disposition.

It is impossible to deny the merits of the *Système de la Nature*. The work of a great writer it unquestionably is; but its merit lies in the extraordinary eloquence of the composition, and the skill with which words substituted for ideas, and assumptions for proofs, are made to pass current, not only for arguments against existing beliefs, but for a new system planted in their stead. As a piece of reasoning, it never rises above a set of plausible

sophisms—plausible only as long as the ear of the reader, being filled with sounds, his attention is directed away from the sense. The chief resource of the writer is to take for granted the thing to be proved, and then to refer back to his assumption as a step in the demonstration, while he builds various conclusions upon it, as if it were complete. Then he declaims against a doctrine seen from one point of view only, and erects another for our assent, which, besides being liable to the very same objections, has also no foundation whatever to rest upon. The grand secret, indeed, of the author, goes even further in *petitione principii* than this; for we oftentimes find, that in the very substitute which he has provided for the notions of belief he would destroy, there lurks the very idea which he is combating, and that his idol is our own faith in a new form, but masked under different words and phrases.

It is the only* work of any consideration wherein atheism is openly avowed and preached—avowed indeed, and preached in terms. (See, particularly, part ii. chap. ii.) This effect of its hardihood was certainly anticipated by its author; for the supposed editor, in his advertisement, describes it, somewhat complacently, if not boastingly, as "*l'ouvrage le plus hardi et le plus extraordinaire que l'esprit humain ait osé produire jusqu'à présent*." [The boldest and most extraordinary work which the human mind has hitherto dared to bring forth.]

The grand object of the book being to show that there is no God, he begins by endeavouring to establish the most rigorous materialism, by trying to show that there is no such thing as mind—nothing beyond or different from the material world. His whole fabric is built on this foundation; and it would be difficult to find in the history of metaphysical controversies such inconclusive reasoning, and such undisguised assumptions of the matter in dispute as this fundamental part of his system is composed of. He begins with asserting that man has no means of carrying his mind beyond the visible world; that he is necessarily confined within its limits; and that there exists nothing, and there can exist nothing, beyond the boundary which encloses all beings—that is, the material world. Nature, we are told, acts according to laws, simple, uniform, invariable, which we discover by experience. We are related to Universal Nature by our senses, which alone enable us to discover her secrets; and the instant we abandon the lessons which those senses teach us, we plunge into an abyss where we become the prey of imagination.

Thus the very first chapter—the opening of the work—has already made the gratuitous assumption of a being whom the author calls Nature, without either defining what that is, or how we arrive at a knowledge of its existence. He has also assumed another existence, that of matter, or the material world; and then he asserts—what is absolutely contrary to every day's experience, and to the first rudiments of science—that we know, and can know, nothing but what our senses tell us. It is a sufficient answer to ask, how we know anything of mathematical truth? And in case a cavil should arise upon geometrical science (though it would be but a cavil) we shall only speak of analytical; and then it is certain that the whole science of numbers, from the rules of elementary arithmetic up to the highest branches of the modern calculus, could by possibility have been discovered by a person who had never in his life been out of

* The treatise of Robinet, *De la Nature*, which, though far less eloquent and dexterous, is superior in real merit, has never attracted anything like the same notice.

a dark room—who had never touched any body but his own—nay, whose limbs had all his life been so fixed, that he had never exercised even upon his own body the sense of touch: indeed, we might even go so far as to say, who had never heard a sound uttered; for the primitive ideas of number might by possibility have suggested themselves to his mind, and been made the grounds of all further calculations.—*Lord Brougham's Discourse of Natural Theology.*

POLITICS.

POLITICS are a constituent part of Universalism, and quite as necessary to be handled and satisfactorily solved as religion itself. But we do not meddle much with the political department, because we know very well that the one department will easily settle the other. Correct principles, upon what we call a System of Nature, or universal religion, will put an end to every political controversy of an important character.

There is the same division in the political world which prevails in the theological world. The subjects of controversy are rendered infinitely divisible by the same irrational and illogical method of adopting one party view to the exclusion of every other. Sectarianism, or the system of dividing a subject into its component parts, and forming a distinct and independent party upon one of those parts, seems to be the prevailing evil of the present generation, and, in fine, of all by-gone ages.

Nor is it possible to discover the literal truth by communication with, or reference to, any individual party. Each is guilty of suppressing what it ought to disclose; each party is guilty of partial statements; of exaggerating its own virtues, and over-calculating the amount of the vices of its opponents. Lord John Russell exposes only the Tory corporations, and Sir Robert Peel exposes only the Whig corporations. The public, however, have made the discovery of the corruption of both.

Both parties are right; they have good reason to abuse and reproach each other; and what is called the Liberal party have never yet been so closely united as to satisfy the world what their political opinions are, except upon some minor subjects, such as vote by ballot, abolition of the newspaper stamp, house-tax, &c.; all of which subjects, though important, are not of that generalizing universal character, which comprehends the whole outline of a system of government. We have no hesitation in saying, that after what are called the Liberal Members have gained these points, they will quarrel upon the very elementary principles of national government.

It is neither Tory, Whig, nor Radical, who will ultimately triumph; but another party, of more liberal and concentrating views than either, will rise up, and combine the most valuable features of the three sects, exceeding the one in order and consistency, and the other in liberality and universal tolerance; uniting the popularity and justice of the Radical system with the subordination, regularity, and determination of the system of Toryism. Toryism is the best system of government, if it were not diabolically unjust. Radicalism is the best system of government, if it were not disunited and destitute of authority. Whiggery partakes of the evils of both.

BIGOTRY OF THE CHURCH OF SCOTLAND.—The Church of Geneva has sent over to the General Assembly of the Church of Scotland a friendly deputation, requesting it to join in the celebration of the third centenary of the Protestant Reformation. But the Church of Scotland,

regarding itself as much too righteous to enter into any friendly communion with the Genevese Church, has not only refused, but actually resolved, upon the motion of Mr. Collins of Glasgow, an elder, and bookseller of that city, and a flaming zealot of the *Temperance Societies*, that it is unbecoming in the Church of Scotland to address the Genevese clergy as Reverend *Fathers* and Brethren, but only as Reverend *Sirs*!!!

According to the Brussels papers, a young man, aged fifteen has lately died of typhus at St. Peter's Hospital, in that city, whose heart and liver were found, on dissection to occupy, each other's places; the heart being on the right side, and the liver on the left.

CORRESPONDENTS.

Amongst our papers we have discovered a letter addressed to the *Shepherd*, signed "A Friend to Truth," which we don't remember to have ever seen before. It is dated "April the 6th, in the year of reason." What year of reason the writer does not say; but, if we may be allowed the use of a pun on a grave subject, we think the writer has hit the truth very nicely; for "reason," or that which is called reason amongst men, has got only one ear, by which it hears only one side of a question, the other being regarded as useless to argument. The questions are rather atheistical, but probably put for the sake of eliciting an answer. They have all been answered more than once, in the *Shepherd*; indirectly, as well as directly. The first, Whether the eternal Nature acts by blind necessity, or with wisdom and design? needs no reply. Blind necessity has no meaning; or if it has a meaning, it means perfect wisdom. The second question, Whether motion and activity are essential properties of matter? is best answered by inverting the question, Is matter an essential property of activity? for the existence of matter as a primary basis is an absurdity. The third question asks whether the atoms which compose the universe may not form different arrangements, compose all sorts of animals, &c. Most assuredly; it is by different arrangements that all variety is produced; but as for atoms, it is only a supposition that there are such things: we never saw an atom, and have no proof of its existence. There are particles of matter, such as sand, but we know of no particular power inherent in them. We know that power may be communicated to them; pith-balls will dance when electrified; but no man can see this electricity, or prove its materiality. We only know that it is a power which can be communicated to and abstracted from certain material substances. But to form an idea of pith-balls, or atoms, arranging themselves to form a cat or a mouse, without a regulating mind, is rather too Arabesque for our credulity, and can only be entertained by those who have carried faith and superstition to an outrageous excess. There is no greater credulity in nature than atheism, and there is scarcely a man in existence who dares to speak or write in defence of it. There is not a publication in Great Britain, so far as our knowledge extends, which candidly professes it; and if there were, we would wager a silver penny that it did not pay its expenses.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 44.]

SATURDAY, JUNE 27, 1835.

[Price 1d.]

SYSTEM OF NATURE.

HAVING in the two last numbers given our readers a specimen of the manner in which the two opposite extremes of universal doctrines can be sincerely adopted and believed at one and the same time, it behoves us now to caution them against supposing that our doctrine of universalism is merely a tame compromise of matters between two conflicting extremes; by which compromise we abandon our own independence, and become merely a vacillating mediator between one party and the other, showing favour to this or that according as the circumstances of the times shall direct, by holding out a flattering promise of success. Such mediators there have been in all ages; men without principle, without any definite object in view, but merely the artificial settlement of inveterate quarrels; who took neither one side nor the other, because they took no interest in the subject of discussion, and cared not how the dispute was settled, provided only it was settled amicably.

This indeterminate and unprincipled spirit of mediation has seldom been effectual in producing the end in view; it gives satisfaction to neither party. No mediation has any chance of success, unless its object, and its means of attaining that object, are as specific and intelligible as those of the two conflicting parties. There must also be a kindred spirit of zeal or enthusiasm to meet the ardour displayed by those whose union is contemplated; but an enthusiasm so much under control, that it will never exhibit any excess or imprudence in urging its doctrines or plans of action where there is no encouragement afforded them. A mediator who proposes to effect a junction between two political zealots, the one belonging to the Tory and the other to the Radical party, could never succeed in attaining his end by assuming a medium state of indifference or apathy, by this means to draw the two opposite individuals towards a focus of union. The consequence of such attempt would be an assault of both parties upon the mediator himself; he would be placed in similar circumstances to the unfortunate wight who interferes in the family quarrels of a man and his wife: his interference would give a new direction to their passion, and they would vent it all upon the poor umpire.

This indifference or apathy, which results from inability to comprehend the subject of controversy, is a purely negative principle; and as it often assumes the character of a mediator, and as frequently fails in the object contemplated, so the public mind, not having been taught to distinguish between positive and negative

causes, is very apt to treat with contempt every mediatorial doctrine or system, and predict the same sort of success which almost all such attempts have hitherto experienced; and not only so, but also to bestow upon them that apathetic and unprincipled character which they have universally received. Were it possible to prove that our universalism is as indefinite and unprincipled as any other doctrine is, we should not write a syllable more in its favour; or did we think it calculated to extinguish zeal, or put out the lamp of devoted enthusiasm in the cause of human redemption; did we think it led to the evils which result from the fatalism of the old world, or the superstitious fears, rites, and observances of mystical times; that it in any degree relaxed the efforts of the human mind in the search and acquisition of knowledge, the improvements of art, or the cultivation of social morals, and every other refinement which gives increased nobility and grace to the human countenance, and brings it nearer to that *beau ideal* of perfection which Christianity and Paganism have both denominated "the incarnate God." Did we think it likely to multiply the causes of contention, or confound the distinction between moral good and evil; that it justified the liar, the thief, the murderer, or any other species of delinquent; that it wrested the power from the hands of the law, and levelled the obedient with the disobedient, the orderly with the disorderly, conferring the same rights and privileges upon both; that it destroyed faith, or hope, or trust in Divine Providence; or extinguished any of the sublime and exhilarating prospects which religion has taught the human mind to entertain, and which have been, in all ages past, and will be, in all ages to come, identified with the human mind itself; did we think it calculated to produce any one of those effects, or effects resembling them, either in the confusion and anarchy of government, or the gloominess of the future prospects of mankind; then we would acknowledge that it was only a negative mediator, which attempted to effect a conciliation between the two parties, by merely throwing cold water upon both.

There are many such mediators in the world already; men who are neither one thing nor another; who are neither believers nor infidels by profession, but who are cold as ice to the enthusiastic spirit of both. Such are the Deists and Unitarians, who are in general extremely lukewarm upon all religious subjects. There are many exceptions to this general rule, but this is their prevailing character, and therefore they may be esteemed, in the present state of the public mind, the vanguard of the progress of society. They obtain this precedence by their indifference to, and silence respecting, religious subjects.

When one party is guilty of extravagant zeal on the one side or the other, this intermediate party is ever ready to correct and chastise it. The state priest, and the canting sectarian, and the determined infidel, are equally liable to the infliction of the rod from this omnipresent school-master, who may now be said to have possession of all the most influential means of public instruction. The great majority—almost all—of the editors of the public press, either are, or by prudence affect to be, of this intermediate party, which says nothing disrespectful of the faith of the land, but never moves a pen nor wags a tongue in its defence. It merely lets it alone, and whips every man who attempts to raise it up or to pull it down.

This party is the greatest and most powerful party in the land. It may be denominated the Unitarian party; but it is nothing after all. Its strength lies in silence; it has no doctrine, no system; it knows not itself; it only despises the two extremes, and avoids them both. It has entirely abandoned the whole field of theology; it exercises all its talents upon politics and philosophy, in which it shines conspicuous above all others. It makes the greatest statesmen, whether they be Tories, Whigs, or Radicals; it makes the most popular writers, and it numbers in its catalogue the greatest orators; it represents, in fact, the English public, and carries the rod of office with a high hand and a resistless look; but it never can settle the grand question of religion, on account of its purely negative character. It has no principle upon the subject.

We are quite as much opposed to this party as we are to the other two; because we assume a positive principle of mediation, which has a clear and determinate object in view, and builds upon the foundations acknowledged and adopted by all men. Yet we consider that this negative deistical party has rendered great service to the public cause, by tempering the enthusiastic zeal of conflicting extremes; by heaping public odium and scorn upon both, whenever they rose above the level of their own native insignificance. It has put bigotry, intolerance, and hypocrisy to shame, and forced them to skulk into the holes and corners of society, where they pour forth their hideous inspirations in secret, nor dare, as formerly, to fill the public press and the popular ear with their unmeaning and endless ravings and controversies. So much good is effected, that bigotry has been most effectually humbled; but silence will never elicit the truth, nor satisfy the human mind; and silence is the watchword of the party. But its work of silence is not yet done; it must fight with its weapons of ridicule and reproach, its political and experimental philosophy, and its polite literature, until it has humbled the Church, and shamed the Dissenters. It will die when its work is done, and decay long before it can see it accomplished; for before that important event takes place the public mind will be beginning to discover that a negative system gives no satisfaction; and the remnant of faith, which has escaped the wreck of superstition, and which was only silenced by the corruption and abuse of our ecclesiastical institutions, will gradually revive, and demand an enquiry into the momentous concerns of universal life, and universal Providence. There are ebbings and flowings in the public mind, as

well as in the waters of the great ocean. Those ebbings and flowings are as regular and continuous in the one case as in the other; the movements are merely oscillations between one extreme and another. The imperfections of the finite mind give it always a tendency to excess, and consequently to error. It pursues this erroneous view till it finds itself opposed by the returning tide of the opposite spirit, when it gives way, and yields to the stream of the prevailing current.

But how, it may be asked, do we prove that this negative mediation, of which we have been speaking, is not the popular current which is to carry all before it? We reply, simply because it is a negative. It is a physical, and moral, and intellectual impossibility that a negative can ever become a ruling or an active principle. It would be no longer a negative, but a positive, if it did. The faith of the land is the positive and ruling principle, and the negative principle of deistical philosophy and liberalism is merely a destroyer; and nothing can be better than a negative principle to act the part of a destroyer; more especially in an age of literature, when ridicule and satire have such effect upon the public mind. But to suppose that this negative principle will rule the individual mind after public abuses are removed, is to suppose that mankind shall cease to enquire into the great subjects of religion, and settle down into a state of quiet scepticism and neutrality. We may just as reasonably expect that men shall become monkeys, and the sun, moon, and stars be extinguished in everlasting night. The Deists and Liberals will accomplish one important object; namely, the liberation of the human mind from all legislative and moral control over its religious opinions; but any attempt to check the progress of enquiry into the great subjects of revelation, will meet with signal and merited defeat.

THE SHEPHERD.

PROPERTY.

THIS is one of those equivocal species of words which mean any thing, every thing, or nothing at all, just as your argument requires it. With a landholder it means land, and an exorbitant rent, which defrauds the tenant and the labourer of the wages of their toil and the profits of their capital. With a fundholder it means interest or usury for capital, which he himself cannot employ to any useful purpose. With others it means certain peculiar rights and privileges, by which they extort from other men the fruits of their labour, and live in idleness upon the surplus of human industry. A parson's tithes are his property; his Easter-offerings are his property. A lawyer's immunity from certain taxes which afflict the rest of the people, is his property; and to impose the same burden upon him that other men carry, would be an act of robbery. A sinecurist's pension is his property; he has had it for so many years, and was led to suppose it would be continued for life; it would therefore be an act of open plunder to deprive him of the undeserved grant. A corporator's privileges are his property, and some of these are very extravagant, as the late Municipal Commission has discovered, amounting, in many cases, to several hundreds per annum, in immunity from certain imposts which other men are obliged to pay.

Besides these, and a hundred other items, there is a peculiar species of property called power, which generally goes hand in hand with money. This power enables its possessor to oppress the poor man with impunity, by giving him a protection against all legal proceedings, which can only be employed by those who have it in their power to line the pockets, of the *distributors* and *executors* of justice, with gold. Justice is a hireling: he who has the greatest amount of wealth has the best chance of success; but he who has no wealth can get no justice at all,—it is entirely beyond his reach. Law and justice will always be a mass of confusion, as long as there are lawyers who lend themselves as hirelings to any cause which can afford to employ them. They are the same curse in politics which priests are in religion. They have taken the task of intercession for the people into their own hands; a task which the people could perform for themselves with much greater propriety and effect, whether it be before the tribunal of heaven, or an inferior tribunal upon earth. This task both the spiritual and temporal intercessor must abandon, as a piece of unnecessary and mischievous officiousness.

All those species of property to which we have alluded are the legitimate property of the rich, of whose rights the nobility and gentry are tenacious to a scruple; they are always ready to raise an outcry whenever it is assailed, or seemingly in danger. If rents fall fifteen or twenty per cent., the landlords cry out "Ruin, ruin!" but not a word of ruin when the wages of the poor man fall a hundred or a hundred and fifty per cent., as they have in many cases done. The Poor-law Amendment Act was expressly enacted for the purpose of saving the landlords from ruin! Poor, helpless creatures! What a providential interference, to save their carriages and livery servants from suffering diminution! We are not a little amused with some of the arguments, *pro* and *con*, on this as on every other subject. A landholder deploras the lowness of the rents, and the cheapness of bread. A poor man can now eat a loaf at one-third the cost of the early part of the century. Wheat at 38s., instead of 110s., is most disastrous! What will become of the rich, when the produce of their land is so under-rated? Their property will become of little value; their rents must be lowered; and the man who works will have greatly the advantage of the man who goes idle. Mr. Richards prophesied in parliament, when speaking on Mr. Cayley's motion on agricultural distress, that wheat would fall *lower and lower*, till at last there would be a famine, and the necessaries of life *be purchased at an extravagant cost*. How wheat can fall in price, until it becomes monstrously high in price, is more than any other head but an aristocratical Tory landlord can comprehend. But this we can comprehend, that the lowness of bread at the present time is a very lucky thing for the working man, and not occasioned by a scarcity of wheat, as Mr. Richards and some of his brother logicians seem to imagine, but by a bountiful harvest; and we trust that this cheapness will continue to increase until the landed gentlemen be compelled to lower their rents fifty per cent., even though it should ruin one-half of the idle gamblers who compose the list of them. The only thing that can

relieve the land is the reduction of the rent. The ruin of the soil does not necessarily follow from the ruin of the individual who owns it, provided the property be alienable, and fall into the hands of industrious and less exorbitant proprietors. The wealth and extravagance of our aristocracy is a sufficient proof that the land is still exceedingly productive, and that the outcry of the owners is a mere selfish whine, which ought never to be weighed in the scales of human sympathy with that of the farmer and the labourer, who are at present the only sufferers.

We do not see what the depreciation of the currency, or the alteration of the standard from gold to silver, has to do with the perplexities of the landed gentlemen; for there is no possibility of averting the destiny to which they are fast hastening, namely, the depreciation of their property, which has been artificially raised to a greater value than is consistent with the justice due to the tenant and the labourer. There is certainly very little danger of producing a famine by lowering the rents and reducing the ecclesiastical burdens!

THE DOCTRINE OF THE "WOMAN."

NO. X.

WE think there cannot be a doubt, from the few remarks we have made on this subject, that the man represents the active, political, and positive; and the woman the passive, moral, and negative principle. Let us, then, in few words, and without any preamble, divide the human government, or the science of society, into its two component parts, namely, politics and religion; and we find that the former is the male and the latter the female department; the former the department of law, the latter of liberty. It follows, then, that the one department is subject to law, and the other is not subject to law; the one must act positively, the other must act negatively; by acting positively, the law interferes with the external political conduct of the subject; by acting negatively, religion never interferes with the religious conduct of any individual, nor takes any legislative measures to maintain or defend itself. This is the consummation formed upon the model of Nature herself, as exemplified in the sexual division of all things.

In illustration of the beautiful effects which must result from such a system of toleration and impartiality, there cannot be a better allegory than the simple story of creation. First man was made, but he was unhappy; a woman was taken out of him, and she was to bring him a saviour. This saviour will come by the deliverance of the church from the trammels of legislative interference: men will then pursue their enquiries into universal subjects, uncorrupted by the spirit of political partizanship, which now adulterates the heart of almost every clergyman in England. The motives will necessarily become purer; the enquiry will become a philosophical enquiry, conducted upon principles and urged by inducements similar to those of any other philosophical or scientific study; and the male department of the law will then find a helpmate and comforter in the female department of morality and religion: at present, they are physically united; then they will become morally and spiritually united, and reciprocally promote each other's designs.

This is the distinction which ought to be observed between the establishments of the old world, and such an establishment as we anticipate; the one is a physical Siamese union, which we detest; the other is an intimate, social, and co-operative union of love, a marriage-union, created by similarity of principle and intentions, both contemplating the public good, and both actually engaged in its promotion, in their own respective departments of public and private morals, universal and individual life; the state over-ruling, with providential eye, the totality of the national conduct; the church, with maternal and perceptive care, contributing to the refinement of private morals.

HORRIBLE INJUSTICE.—OF CHARITY.

UNDER the Pocklington Foundation, land, yielding annually the sum of 1*l.* 4*s.* 10*d.*, was devised to St. John's College, Cambridge, for the education of poor boys who might be found qualified. It has fallen into disuetude, however, in consequence of the smallness of the sum, and its inadequacy to maintain the scholars; but, in consequence of the increase which has since taken place in the value of property, it now yields no less than between 600*l.* and 800*l.* a-year, which the College insists it holds in trust, refusing to allow more than the exact original sum of 1*l.* 4*s.* 10*d.* to the competent boys, and appropriating the remainder to the fellows. The Winchester charity yields little less than 14,000*l.* a-year. The terms of the grant are these: that no boy shall be admitted to the foundation who is a possessor of an annual property to the amount of 3*l.* 6*s.* 8*d.*; and there is a provision which stipulates that, if, while any boy is on the charity, any circumstances occur by which he becomes possessed of the value of 5*l.* a-year, he shall be excluded from all benefits of the institution; but it has been interpreted that 3*l.* 6*s.* 8*d.* of the day when the grant was made must be considered *now* to mean 66*l.* 13*s.* 4*d.*; and the consequence is, that the sons of persons, who, from their station, ought to be sent elsewhere, and to be paying for their education, are reaping the benefits of this splendid institution, which was originally intended for the benefit of the poor. The number of scholars on this foundation is only seventy, so that there is an annual income of 12,000*l.* or 14,000*l.* a-year expended on them exclusively, at the rate of 200*l.* a-year for each boy. (See *Mr. Harvey's Speech on Charities.*)

"I know of a foundation in a large manufacturing town, with an income of some thousands a-year, and which offers to the numerous uneducated people a kind of instruction altogether useless, (namely, Latin, Greek, and Hebrew, because it was endowed as a grammar-school,) while writing, geography, cyphering, book-keeping, mechanics, chemistry, drawing, would be invaluable acquisitions to the whole community. I could name other schools of the same kind, with nearly as good an income, and which support well-endowed masters to teach *two or three boys*, because they are *grammar-schools*. There are many who covet the place of the master of an endowed school, though the salary may be small; but this covetousness is not of teaching the poor. That was the object of the founder, who desired to see instruction dif-

fused among all the children of the humbler classes; but that is no object with the schoolmaster, who lives in the founder's house, and takes the profits of the land. The doors of his school are, no doubt, flung open, and there is no manner of doubt that the poor children may enter, *if they dare*; no doubt that the boy may come in; the parent may send his child, if he had rather his child should suffer under and plague the master, than that he himself should suffer by being plagued with the child at home. The endowed schoolmaster will never shut the door in the child's face, nor ever tell him to depart, nor in words threaten the parent, nor forbid him; the endowment must in no wise be openly violated; but this I also know, that the master of the charity-school has boarders, children of a higher rank and station, under his care and in his house—the very last creatures in the world that the founder ever dreamed should enter it. The wary master knows full well how the children of the better classes dislike to associate with the charity boys. He feels that as the number of the unprofitable pupils increases, the number of profitable ones falls away, and therefore, although the door is open, the master's face is not open: on his brow sits the frown perpetually; his hand beckons not to entice the pupil of humble degree, the sole object of the donor's bounty; it is lifted only in anger, and as the instrument of punishment; and the boy, not the teacher, is of course always in fault. Thus I have lately heard, in Chancery proceedings, of amply endowed schools, the poor scholars of which had fallen off from one hundred and one hundred and fifty, to one, two, and three; and yet the foundation exists, the master exists, the house exists, the fund exists for the repairs, and the furniture, and the taxes. The name of the school is, or has been, celebrated as an endowed establishment; but its reputation is amongst the wealthy, whose children are there boarded at large prices, and taught Greek, Latin, and fencing, and the dance; while no man knows that it is all the while a *charity-school*, the benefits of which have been handed over to be enjoyed by the rich, and to serve the interests of the master." (See *Lord Brougham's Speech on Education.*)

The above are ample demonstrations of the enormous wickedness which prevails in the management of what are called charitable foundations. All the institutions of the country are diseased; a universal plague has been ravaging the religion and morals of the community. Why should the clergy wonder at the increase of infidelity, or the Tories, of discontentment? Every parish proclaims the infamy of those things, which have too long been known by the names of piety and respectability.

PRICKINGS OF CONSCIENCE.—Lord Denman says that, after serious reflection, he doubts "how far the state has a right to inflict punishment for any offence, against the commission of which it has taken no means to guard." We hope his lordship and his brother lords will continue to doubt, until they have taken all the means in their power to guard against the commission of crime.

It is a very singular thing that while Dissenters of every denomination build chapels for themselves, and multiply their congregation indefinitely, that the Established church cannot build a single chapel without a grant from government.

SINGULAR NARRATION.

Extracted from a publication, entitled, "Foreign Scenes and Travelling Recreations," by John Howison, Esq., of the Hon. East India Company's Service.—1825.

"Shake off the intrusive cares of day,
And lay the meddling senses all aside."

—THOMSON.

THE following narration, coming from the pen of a gentleman who, it is presumed, can vouch for its authenticity, is in itself so peculiarly remarkable, that its present introduction may not, perhaps, be altogether inappropriate. Any further reflection upon these very singular circumstances must, however, be left to those who may be induced to bestow a more serious consideration on the detail.

In "A Voyage from Havannah to New Providence," it appears, that Mr. Howison, returning from an excursion to Holguin, went on board a sloop in Guibana harbour; but finding that she would not leave port till the next night, he accepted an invitation for the evening from the master of a schooner that lay near.

"When the evening was pretty far advanced, he conducted me," says Mr. Howison, "to the cabin, which was almost full of large packages, and pointing out where I was to sleep, left me alone. I felt a heavy suffocating smell, but did not think of examining the contents of the bales, and immediately went to bed. Soon afterwards I was harassed by wild and frightful dreams, and suddenly awoke about midnight, bathed in a cold dew, and totally unable to speak or move. However, I knew perfectly well where I was, and recollected everything that had occurred the preceding day; only I could not make any bodily effort whatever, and tried in vain to get up, or even to change my position. The watch on deck struck four bells, and I counted them, though it seemed to me that I did not hear the beats, but received the vibrations through my body. About this time a seaman came into the cabin with a light, and carried away an hour-glass that hung upon a nail, without observing me, though I made several efforts to attract his attention. Shortly after a pane in the skylight was broken by accident, and I saw the fragments of glass drop on the floor. These circumstances actually occurred, as I found on enquiry next day; and I mention them to prove that the sensations I describe were realities, and not the offspring of perturbed dreams. My inability to move was not accompanied with pain or uneasiness, but I felt as if the principle of life had entirely departed from my frame. At length I became totally insensible, and continued so till an increase of the wind made the sea a little rough, which caused the vessel to roll. The motion, I suppose, had the effect of awakening me from my trance, and I contrived, some how or other, to get up and go upon deck. My memory was totally lost for about a quarter of an hour, and I had no ideas connected with anything that was not present before me. I knew that I was in a ship, but nothing more. While in this state, I observed a man drawing water from the sea in buckets, and requested him to pour one on my head. After some hesitation, he did so, and all my faculties were immediately restored, and I acquired a most vivid recollection of a vast variety of ideas and events which appeared to have passed through my mind, and occupied me during the time of my supposed insensibility.

"All this singular constitutional derangement had

arisen from a copious inhalation of the fumes of tobacco; for, on examining the cabin, I found that the pile of packages there consisted of that narcotic plant, and that quantities of it lay even under my bed—in short, that the sloop contained almost nothing else.

"I should not have been so particular in mentioning these circumstances, had not I heard something analogous to them from a German oculist, whom I met with in Havannah. This old man, who was altogether a very singular character, told me that the digitalis, or foxglove, the belladonna, or nightshade, and several other plants of a similar kind, possessed peculiar properties, which were not generally known even by the medical profession. When administered, he said, in a certain way, they could be made to act so powerfully and directly as sedatives, as to destroy all sensibility and voluntary motion, without affecting the animal life, or impeding its necessary and healthy action and functions; but with this remarkable peculiarity, that the mind or soul did not participate in the comatoseness which affected its mortal tenement, but was more than usually active and excursive. On these occasions, however, the individual to whom it belonged had no perception of anything of the kind. His body enjoyed an animal existence, as it were, without sensation, and nothing more. But when the effect of the narcotic was dispelled, either by counter-agents or by time, he recovered from his lethargy; and active life, memory, will, and intelligence, returned, with a perfect knowledge of all the operations and employments which his mind had gone through, from the moment of his losing his perceptions, to that of his reviving and of their being restored.

"The German explained all this in the following way:—Life and the soul, he said, are separate essences, though intimately connected together; and when the powers of the former have been enfeebled to a certain degree, the latter disengages itself from the body, and continues its agency unlimited and unembarrassed by the encumbrance of corporeal matter. However, on the animal functions beginning to recover their natural vigour, their immortal inmate is attracted back, by a peculiar sympathy, to its earthly tenement, and the human being, which they jointly compose, awakes to intelligence, and suddenly recollects all the ideas that have passed through his mind during the period of his suspended animation. These my friend described as often being vivid, original, and marvellous, beyond description, such as entirely exceeded the conceptions of man in his natural state of existence. After descanting a considerable time upon the subject, he related the following story in illustration of it:—

"While in Germany, he had resided some months in a town which was the seat of one of the minor universities. Being at that time rather poor, he engaged apartments in a lonely house, a considerable way beyond the suburbs. Its occupants, besides himself, were an old man and his wife, to whom it belonged, and a person of the name of Meildenvold, who was studying medicine. He lived in a very retired and singular way. However, as Engel and he boarded as well as lodged with their landlord, a certain degree of intimacy soon took place between them. Engel quickly discovered that his companion was no common character. In him reserved manners and a melancholy deportment were combined with a wildness and extravagance of ideas that sometimes approximated to madness. His conversation was abrupt, and had nothing of common-place; for he never talked, except when excited to do so by some emotion; and he often made dark allusions, and expressed thoughts and opinions

of such a mysterious and startling nature, that they seemed almost superhuman. He evidently avoided society as much as possible, never going into town except to attend the lectures, and always returning home as soon as they were over.

"In addition to his apartments in the house, he occasionally occupied a small detached building about twenty yards off. He kept the key of this place to himself, and never allowed any one to enter its walls; within which he regularly shut himself at an early hour on a certain night every week, and remained in seclusion till the middle of the succeeding day. When he came forth he was always haggard, ghastly, and dejected; but notwithstanding this, he never failed to commence writing very busily, and to continue doing so often for several hours together. He then seemed relieved, and resumed his usual habits and appearance till the mysterious evening returned.

"Engel's curiosity was excited, and the more so as his companion showed every disinclination to gratify it, and repelled his hints and enquiries in the most decided manner. He also felt an interest in the young man, who evidently was in a declining state of health, and very unhappy. He had once, too, when passing the building above described, caught a glimpse of its interior, and seen some objects of an extraordinary kind, among which was a board covered with black cloth, and placed against the wall in a sloping direction, and clamped at its lower end to prevent it from sliding forwards. There were also a large trough full of water, and a number of phials and some chemical apparatus.

"Engel had one night continued reading to a later hour than usual; his host and hostess had both retired to rest, and every thing was quiet and solitary around him. On accidentally looking out, he observed a faint light glimmering in Meildenvold's secret apartment, and recollected that the young man's period of seclusion had commenced that evening. Engel, impelled by irresistible curiosity, resolved to ascertain how his friend was employed. He left his apartment, and proceeded cautiously towards the small building, though the darkness prevented any chance of his being discovered. On reaching it, he found that the windows were so high above the ground that he could not raise himself sufficiently to see through them, without climbing up the walls. This he accomplished with some difficulty, and at length obtained a view of the interior of the apartment. It was lighted by one lamp, which was hung from the roof, and the form of Meildenvold lay immediately under it, on the board already mentioned. He was habited in a white dressing-gown, and looked pale, stiff, and ghastly; his eyes, though only half-closed, being dim and fixed in their sockets, Engel thought him dying or dead, and his first impulse was to force open the door and hasten to his assistance; but on observing things more attentively, he became almost convinced, from the state of the apartment and the position of Meildenvold, that his insensibility was the effect of design. He therefore continued to watch the body, which exhibited no symptoms of life, though the faint flickering of the lamp sometimes almost deceived him into the idea that it moved, and that the countenance began to acquire animation.

"He waited half an hour, but still no change took place. He then descended to the ground, irresolute whether to remain any longer, or to return home and call up his landlord, and make him break open the door, which was locked inside. But he reflected that he had no right to force himself into the private haunt of any

one, even for a good purpose, and therefore sought his own apartment again, and went to bed—though not to sleep, for the death-like form of his friend occupied his mind constantly; and in the morning he got up, expecting to learn that Meildenvold was no longer in life. The day advanced to noon without his appearing; but this circumstance passed unnoticed by his host, because it had nothing unusual in it. Engel, however, was in a state of anxious trepidation, and at length determined to ascertain the state of his friend by personal enquiry. On leaving his apartment, which opened into a long passage, he saw Meildenvold at one end of it, and started back, almost doubting the reality of the object before him. The young man hurried past without speaking and entered his own chamber, and shut the door, though Engel called after him, and asked him how he did.

"Things went on as usual till the recurrence of Meildenvold's night of retirement, when he shut himself up in the same manner, and at the same hour as formerly. Engel was desirous of knowing whether or not his friend would have another lethargic fit, and likewise of witnessing its commencement. He therefore went to the building as soon as the lateness of the hour enabled him to elude observation. He mounted the wall with a palpitating heart, and looked into the apartment. There was Meildenvold stretched out in the guise of death, and every thing around him in the same state as before. Engel gazed upon him for a few moments, and then, from a sudden impulse, forced his way through the window, and leaped upon the floor, and advanced cautiously towards the body, fearful lest he should wake it from its torpid state; however this seemed almost impossible, for the surface was cold, the pulsation of the heart scarcely perceptible, and the breathing very feeble and protracted.

"Engel now observed that the window was so high above the floor that he could not reach it, and make his egress in the same way as he had entered; for the wall was too smooth to be climbed, and the apartment did not contain any piece of furniture upon which he could elevate himself. The door was locked inside, but the key had been removed. He found himself a prisoner, and strolled about the chamber in a most uncomfortable state of feeling. The midnight hour, the loneliness of the place, the mysterious condition of his friend, and the ghastly appearance of his body, as seen in the glimmering of a dim and unsteady light, excited an undefined awe and apprehension. He wished his friend would revive, yet he almost feared to encounter him, conscious as he was of having acted the spy, and viewed him in a situation which he evidently desired should be a secret one.

"But in the midst of these reflections Engel's attention was drawn to the lamp, which seemed on the point of going out. He stepped upon the edge of the platform, for the purpose of trimming it; but, while doing so, the wick dropped into the oil, and the flame was instantaneously smothered. The darkness which succeeded was nearly total, and Engel remained fixed in the same spot for several minutes; but when his eyes became accustomed to the obscurity, he began to discern the platform and the white dress of Meildenvold. He seated himself in one end of the apartment, resolving to await patiently the issue of the adventure in which he had imprudently involved himself.

"It was not till the lapse of three hours that Meildenvold began to give signs of returning sensation. Engel heard a succession of deep-drawn sighs, and soon after saw his friend raise himself up, and lean his head upon his hand. He gradually gained an erect position,

and staggered across the room, and the next moment a loud plunge took place. He arose from the bath in a state of complete resuscitation, and appeared, for the first time, to observe that the lamp was extinguished. Seizing a tinder-box, he struck a light, and Engel stood disclosed before him. His astonishment was great, but it soon yielded to displeasure, and he demanded, angrily, to what cause he owed such an untimely visit. Engel dealt sincerely with him, and related the origin and progress of his curiosity, and explained how he had gained admission into his private retreat. Meildenvold was appeased,—‘And yet,’ said he, after a short silence, ‘why should I refuse to explain the scene you have just witnessed, for it has nothing of guilt in it? I am only sacrificing my health and life to intellectual enjoyments, and health and life may surely be used at pleasure by one so disunited from the world as I am. You must know that, some years ago, I accidentally discovered that certain plants possess peculiar powers over the mind and body, emancipating, as it were, the former from the thralldom of the latter, and enabling those who know how to employ them, to enter, for a time, into an existence almost purely spiritual. You see on that table various preparations of the hemlock, foxglove, deadly nightshade, and other narcotic herbs. I am in the habit of occasionally using these to produce the effects I have described, and you have recently seen me under their influence. It would be impossible now to go into particulars; but you must be convinced, from what you observed while I lay on the platform, that my body was then the seat of the simplest powers of animal life only; in short, that my spiritual part had fled, or, at least, had lost all sympathy or connexion with my corporeal. At present, I have no recollection of any thing during that period; but a short time hence a flood of ideas and images, of the most vivid, wonderful, and tremendous description, will rush upon my mind, and bear evidence that I have partaken of a super-human existence. Many of these I have recorded in a book, with the contents of which I may perhaps one day make you acquainted. I will tell you more when we next meet; but, in the mean time, I wish to be left alone.’

“He unlocked the door of the room, and Engel departed. In the course of a few days, the latter did not fail to remind Meildenvold of the promise he had made to disclose to him some of his mysterious secrets; however, he for a long time deferred doing so on various pretexts; at length he fixed a night for this purpose, and it was agreed that Engel should come to his apartment at a certain hour. Engel had gone into town, as usual, on the morning of the preceding day, and some circumstances occurred to detain him there all night, and likewise till the afternoon of the evening on which he was to meet his friend. His business being finished, he hurried homewards, and arrived there just as the hour of rendezvous was tolled by the bell of a neighbouring cathedral. All was quiet in the mansion, and he hastened up stairs to Meildenvold’s apartment, but found no one in it, nor any fire nor lights, nor any marks of its having recently been occupied. Engel, after his first sensations of astonishment had subsided, thought it possible that he might have misunderstood his friend, and that his own apartment was to be the place of meeting. He hastened there, but saw no traces of Meildenvold. He strolled from one room to the other in a state of perturbation and vague alarm, and at a loss what conclusions to form.

“He at length determined to seek Meildenvold in his private apartment. He crossed the court-yard, and gained it in an instant, and, on looking in, saw him ex-

tended, as usual, on the couch; but, if possible, more pale and inanimate than on any former occasion. Engel did not scruple to enter through the window; but, on approaching and examining the body, he found, to his horror and astonishment, that life had entirely departed! Those accustomed to the aspect of death never mistake it. The stiff limbs, sharp features, and frozen physiognomy of Meildenvold showed that life would never revisit his frame, and that he had fallen a victim to the influence of experimental philosophy, and to a love of imaginative existence. Engel had scarcely recovered from the shock of this discovery, when he began to look for the manuscripts which his friend had mentioned, but his search proved ineffectual. He immediately roused his host, and announced the death of his fellow-lodger. His remains were interred privately, for he had left no clue that could lead to a knowledge of his relations or connections, or even afford grounds for supposing that he had any.”

SPECIMEN OF THE ARCHBISHOP OF CANTERBURY’S LEARNING.—The Primate of all England felt particularly insulted by the Earl Fitzwilliam calling the Church of England a sect. His Reverend Grace insisted that it was quite unconstitutional to talk so. The Church of England was not a sect, but a *church*. Fitzwilliam having referred the Archbishop to his Latin and Greek dictionary, the Archbishop, in order to match him in learning, replied, that, if the noble lord goes back to etymology, he may just as well say, looking at the Greek derivative of the word *hierarchy*, that the English Church is a *heresy*. The Primate of all England, the Learned and Reverend Prelate, meant it to be understood that these two words come from the same original Greek root; but there is not the slightest connexion between the two; for the first comes from two Greek words, signifying *sanctified government*, and the second from a Greek word signifying a rooted opinion or hobby—a dogma. His Grace has forgotten his Greek; for instead of identifying *heresy* with *hierarchy*, it ought to have been identified with *sect*; for *sect* and *heresy* are, in the Greek language, one and the same word. The sect of the Pharisees is called the *heresy* (*haeresis*) of the Pharisees. And pray, what is the *Church* of England but a *heresy*? and a very small, contemptible *heresy* it is, compared to the universe.

VARIOUS VALUES OF TITHES.—There is one view of this subject which it is important should be attended to by those who wish to trace the effects of different imposts on the condition of the people, namely the effect of a rise of rent on the burden of tithe. For instance, if land were rent free, a tithe would merely give a value equal to one-tenth of the labour bestowed on the land to raise the crop, with common profit; but if a high rent is exacted, a tenth of the crop does not merely give a tenth of the value of the labour (with common profit) bestowed in raising it, but also the additional price, or exchangeable value, which arises from the whole being subject to a high rent. Let us take a case of a single farm from which produce is obtained, which, if there were no rent, would sell for, say 300*l*. The tithe of this would, of course, be worth 30*l*; but let a rent of 50*l*. be charged for this farm, and the value of the tithe becomes 35*l*., or one-tenth of 350*l*., because the whole produce must now sell for that sum. In like manner, let rent be raised to one-third of the previous value of the produce, or 100*l*., and that produce must sell for 400*l*., and the tithe would be worth 40*l*. In parts of Ireland rent is said to amount to more than one-half the value of the produce, and, as it sells loaded with the rent-charge, the exchangeable value is more than

double the amount of the labour value, and tithe is, consequently, more than double the labour value that it would be if land were rent free! But this is not all, the tithe of landed produce, being itself a tax, increases the exchangeable value of the articles taxed, so that the tithe receiver gets his tenth of the produce, when it is enhanced in value by the tax of that tenth, and this too, is in addition to the enhancement through the rent paid to the landowner.—*Hopkins's Great Britain for the last Forty Years.*

PROGRESS.—Society is not all progressive; it is contrary to the doctrine of universalism to suppose so. It is both progressive, stationary, and retrograde. Many of the human race remain to this day in their original savage state; many have even fallen below it; and many, after having made considerable advances, have retreated into their original savagism. All this is necessary to give a full development to human nature. When civilized man has become more universalized than he is at present, he will receive abundant instruction from the analysis and careful study of savage life. It is primeval Nature, and its simplicities are indispensably requisite to perfect the system of refined and cultivated society. The world has lost nothing by one half of its inhabitants remaining in their original uncultivated state. Nor is Providence a whit less kind to the savage than to the civilian. The gentlemen of the Tract Society, we know, differ from us in this particular, for they send all the savages to Hell. So do we; but the tract gentlemen think Hell a very bad place. We do not: it is the place where evil is destroyed.

PROTESTANT REFORMATION.

THE Protestant Reformation was the destruction of old universalism. It forms a new era in the history of the human mind, when man ceased to theorize upon universal existences and unknown causes, wisely directing his attention to individual facts; collecting materiel from external nature to form a theory of the universe, instead of resorting to imagination alone, as was the case with all the old philosophers and mystics and divines of every degree, down to the days of our celebrated countryman, Lord Bacon, the reputed father of inductive philosophy, that philosophy which divides the labour of the enquiring mind, by apportioning to each student of nature a small department of science, to study it well, instead of confounding all science in one universal mass, too great for the feeble mind of man to grasp, until he has carefully analysed the detail. This new inductive philosophy was the death of universalism; but inductive philosophy, as even its very name implies, is not the termination to which we aspire. Induction is of no use without a conclusion. It is foolish to be everlastingly weighing an article, if you never discover its weight. The weighing is an operation performed on purpose to ascertain a final truth, and so is induction, and the system of induction, or the collection of individual facts. It is pursued on purpose to arrive at a universal system.

The new system of Protestantism, therefore, is evidently not a final system. Indeed, it is not a system at all: it is a state of tutelage and anarchy; a state of transition from a false system of universalism, founded upon theory, unsupported by facts, to a new system of universalism, supported not only by every species of human knowledge, that is, all known facts, but also so theorized, that no conceivable fact to be hereafter discovered can ever overthrow it. This latter is an essen-

tial characteristic of a universal doctrine. If even a possibility can refute it, it is of little use, because it must leave a doubt on the mind. We have often said, and we repeat it again, that we are perfectly willing to defend our doctrine with this decided disadvantage against any opponent; namely, that he be permitted to invent facts, whilst we merely reason upon his assumptions—provided his facts are not gross contradictions of eternal and universal laws.

Colonel Sibthorpe is fretting himself sadly about reform. "Is there never to be an end of this reform?" he says. "How long is this reform to go on? What will become of the rights of property?" "What is to become of the rights of the poor?" a starving labourer and his children reply; but their voice is not heard.

CORRESPONDENTS.

WE are resolved, according to promise, to finish the *Shepherd* at the 52nd number; but we cannot yet inform our readers whether it shall have a successor immediately. If we do commence another work, it will carry the doctrine of universalism out of religion into politics. The former is the basis, the latter the practical department; the former the root, the latter the offspring. We pursue the same principle in treating of both; but we are not certain that our time is yet come for political universalism; and, therefore, do not wish to commit ourselves by any promises. We are entirely the creatures of circumstances, as Mr. Owen says, and mean to be guided by the impulse of the time being, as we were in bringing forth the *Shepherd*, which was conceived in one week, and brought forth the next. The *Shepherd*, however, is merely an elementary work on universalism; we have purposely refrained from minute details, and must refrain until such interest is excited as to give encouragement to a more particular analysis. That time will come; both church and state are hastening rapidly towards it.

A correspondent asks us, if our doctrine be true, what is the difference between something and nothing? If he be a Cockney, it will be very difficult to make him comprehend the difference, if any there be. Ask a Cockney if he knows anything about the man in the moon? The Cockney most probably replies, "I don't know *nothing* about him." Some people would say, "I do know *nothing* about him," or, "I don't know *anything* about him." They both mean the same thing; from which it appears evident that anything and nothing are one and the same; and *anybody* and *nobody* are so much alike, that, as Alexander Stevens says, "that which is *anybody's* business is sure to be done by *nobody*, and *nobody's* property is generally claimed by *anybody*." There is no such thing as nothing, and yet it is an exceedingly valuable article, as the following undoubted fact will demonstrate: "Nothing is more valuable than good health and a well-stocked purse." What a valuable thing nothing is! we hope, therefore, our correspondent will never more doubt the value of nothing.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 45.]

SATURDAY, JULY 4, 1835.

[Price 1d.]

SYSTEM OF NATURE.

If any of our readers imagine that we are striving to please all parties by our mediatorial doctrine, they much mistake our meaning. Pleasing or displeasing, we have seldom or never thought of. We have always avoided giving unnecessary offence, from prudential motives; but we are well aware that we cannot speak our own thoughts without offending all parties. We are esteemed blasphemers in the eyes of the religious world, and superstitious fanatics in the eyes of the materialists. If we had been striving to please both parties, we should have preserved a perfect silence on subjects upon which both parties are directly opposed to us. We speak from conviction, and have never addressed ourselves to the feelings in preference to the judgment.

Moreover, we do not depend much upon any of our own exertions, or the exertions of any other individual, for accomplishing the end we anticipate of a general union of sects. It can take place at the recommendation or by the influence of no individual or party, but be gradually and insensibly brought about by the decay of sectarian enthusiasm in the first place, and, in the second place, by the charitable and liberal spirit which this negation of dogmatism will imperceptibly generate. There is a very large majority of the religious world, even at present, who are particularly attached to no sectarian principle, but go to church, chapel, or conventicle, according as the distance from home or the character of the officiating clergyman inclines them. Such are merely what they call Christians. If you ask them what they believe, they merely reply, "I believe in Jesus Christ." You can get nothing else out of them. Such people are half prepared for any thing, willing to follow the tide of popular opinion, provided only it have the leaven of faith and hope to sanctify it. Their children are still less attached to sectarian principles.

We are merely in advance of the age, developing a doctrine which mankind must necessarily discover in their march along the course of time. Still there is some little in our power. We can accelerate the progress of universal principles in the minds of many whom we address, because we can facilitate the comprehension and classification of these principles to those whose leisure, or enthusiasm, or want of opportunities of information, retard their solitary advancement in the study; but where there is not some previous preparation of mind, our labour is expended to no purpose; our language is an unknown tongue, as incomprehensible as the grammarless lingo of Irvingism to the carnal mind of

old Adam's posterity, upon whose corrupt nature not even the death of Christ has yet poured one restorative drop of redemption.

Moreover, it is in our power to lay down some general principles, which will stand the test of the most intimate investigation, and of which we may safely predict that mankind must more or less quickly progress towards their acknowledgment. As for moral rules, or articles of faith, we have nothing to do with them; we do not pretend to teach either faith or morals. Both these subjects are unteachable; they are the result of an infinite variety of external and internal circumstances, of organization, mental and corporeal—of employment in life—of adversity or prosperity, and the temptations accompanying them—of education, of acquaintanceship, and many other causes. We may advise, expound, reason, and demonstrate; we may impress convictions on many who are not powerfully influenced, by some such predisposing causes, to follow other modes of thinking and acting; but still the great moralist, the great schoolmaster, is the secret amount of combined influence upon the individual mind, arising from the condition of human society in which it moves, and whose creature it is.

There is a spirit in society distinct from the spirit which actuates the individual, over which the individual has little or no influence. That spirit we call in popular language the spirit of the age. It is the sum total of human mind. It is public opinion, before whose high tribunal every knee must bow, and every tongue confess. Tyrants and their ministers are as mere dust in the balance before this supreme authority. They may resist, they may repine; they may muster their legions, and make their cannons roar, to impede its march; they may raise their embankments to oppose its current; but it is only a momentary resistance; the great tide of humanity rolls on impulsively to its final destination, and wafts even its opponents along the stream, infusing into them its own spirit, even in spite of their will. The ways of this spirit are unfathomable in the detail; but when collectively scrutinized in the history of the past, they assume a systematic character, which the individual eye cannot discern in the multifarious confusion of present events. This character is in exact conformity with the general features of universal nature; unknown to the individual, it has been gradually developing itself according to a model which is discernible in general science, a model from which it has never deviated, even though the ruling minds of society have attempted to draw it aside in a devious path. The leaders of the movement are generally opposed to the final purpose of this universal

spirit of humanity. They contemplate its aim as something revolting to human feeling, and subversive of good government; and they exercise their energies to open up a channel different to that which the great spirit has in preparation. They serve their purpose in the machinery of Providence, and new minds arise with new views, new hopes, and new fears, which sweep away the rubbish of their fathers' folly, and then sink into the same pit of unprogressive and bigoted stagnation. This must go on till universal principles are discovered, and then pray tell us where the human mind can move? It will then recommence the work of individualism, and investigate the details of universal nature with a new eye and a regenerated heart. The discoveries of science will become infinitely more important and useful in the concentration of all to one common point, the unity of faith and morality.

But how can there be a unity of faith and morals, if the spirit of the age, like ourselves, establish no specific rule of action, or creed for society? All morality reduces itself to one word, *Love*. We can say no more. Love is a feeling; it is not a logician. Neither Aristotle, Bacon, nor Locke, can teach it; it grows, and like a plant it grows well or ill according to the soil which nourishes it; that soil is society, and its degree of perfection may be ascertained by the amount of social love which characterizes the intercourse of its members. All faith reduces itself to one word, *unity*; and this can only be perceived by the generalizing mind which contemplates Nature as a whole, instead of puddling for ever in some petty bog of science or of society, which, viewed by itself, is an intolerable, unmeaning nuisance, and creates only exclusive bigots or chaotic infidels—either deplored the forlorn and hopeless condition of *fallen* man, or casting off, with what they call a philosophic mind, every idea of wisdom or design in the universe.

"Love is the fulfilling of the law," says an apostle: we say the same. And the same apostle also declares, that in the dispensation of the fulness of time, all things will be gathered into *one*, and God be *all* and *in all*: so say we. These are our moral law and our creed: *unity* and *love*, male and female; the one an intellectual principle of arrangement, which ascribes all the movements of Nature to one universal, wise, intelligent, harmonious source; the other a moral principle of feeling, which concentrates the individual interests of all in one, and *models* society upon the great intellectual system of harmony which regulates the machinery of the almighty whole.

If man had the spirit of love, he would require no moral teacher; he would arrange society instantly upon just principles. The rich man would say, "I have more than enough: I will give the residue to the poor." He would also discover that his claim to any excess of property was unjust; that it was a public robbery: he would relinquish his claim; nor would he relax his activity in the service of the public: love would be a sufficient stimulus. It is for want of love that man is not happy. Love is the best of all legislators, and the most just of all judges, if you give him *supreme* authority; but love is the worst of all legislators, and the worst of

all judges, if you give him only partial authority; for, out of kindness to the culprit at the bar, he would let loose a scoundrel upon society, who would inflict tenfold more mischief upon *other men* than the executioner would have inflicted upon *him*. It is the universality of love alone that can redeem us, and that can only be created by a social system, in which individual interests are absorbed in the universal.

By absorbing individual interests in the universal, we do not destroy those interests, but rather enhance them; and so also in our system of unity, in opinion, we follow this absorbing *non-destructive* system: we destroy no faith, any more than we destroy individual interest by a social or universal system. Some there are who would destroy faith, and make a pure blank of this half of Nature. We would not. We defy the attempt in ourselves, and we may safely call ourselves the representatives of nine hundred and ninety-nine thousands of our fellow-creatures, and defy it for them for ever; but their faiths shall be gathered into one; they will be glorified; they will be beautified; they will be reformed; they will be socialized; and the spirit of faith, of charity, of hope, shall fill every human breast; and God shall be adored, not in formal hypocritical ceremonies, but in the secret experience of a happy and enlightened mind—adored as the living God throughout universal nature, and not as a lump of brutish matter, or a collection of chaotic and unmeaning circumstances. Such darkness will vanish from the human mind, when *unity* radiates upon it.

Society is now quickly ripening for a system of universal pardon. In the days of ignorance and imperfect civilization, when the conduct of the individual was less under the surveillance of the magistrate and the moral control of public opinion, when mere change of residence might retrieve a lost character, and no informer ever visit the spot or discover the residence of the unrepentant criminal; there was some other influence, of a more watchful and all-searching nature, in requisition, to curb the excesses of passion and ignorance. Such an influence was found in the all-prevailing belief of the divine tribunal, before which every individual soul would meet an arbitrary verdict of innocence or guilt. But now the universal spirit of society is collecting its scattered members together, and qualifying itself to do all this work of judgment, in a more effectual manner. Public opinion is omnipresent; it searches out the sinner in the darkest and most secret lurking-places of iniquity; it follows him from country to country; it haunts him in every city and hamlet, till he repents at last of the rashness which prompted him to sin against a judge who is omnipresent, stern in justice, and will by no means clear the guilty. The power of this influence is rapidly growing, and men are becoming polished in proportion to its growth. Hell-fire is now of no use, and in a few years we believe it will have suffered a considerable diminution in its temperature. It was an admirable substitute for public opinion, but far inferior in influence; as the result has testified.

But, says the pious Christian, will a murderer enter the same blessed regions which receive the hallowed soul

of a believer in Jesus? Hypocrite! art not thou a murderer, a thief, and a liar? Who made thee one tittle better than the unfortunate wretch who swings on the gallows? Hast thou not broken the whole law in offending in one point? Is not every liar to be cast into the lake of fire?—But can there be a murderer in the other world? No; no murderer shall enter the kingdom of heaven. Suppose I murder a fellow-creature, and am hanged for the offence, and appear in spirit before this local tribunal beyond the grave; the judge says to me, "You have murdered a man." I deny it. The judge says, "I will prove it." I say, "Do so." He calls the individual himself as a witness. I immediately reply, "The man is alive and well: how can a *living* man give evidence against me, that I have murdered him?"—Verdict—Not guilty. If it be replied, I had murdered his body; I answer, "They murdered my body in return: I have made atonement." Should any one reply, "This is giving encouragement to crime," we reply, "Jack Ketch is a better devil than the devil himself."

THE SHEPHERD.

ON RELIGION.

Es liebt die Welt das strahlende zu schwarzen,
Und das Erhabene in den Staub zu ziehn,
Doch fürchte nicht es giebt noch schöne Herzen,
Die für das hohe Herrliche entglühen.—Schiller.

The world takes a delight in blackening and vilifying lofty and sublime sentiments; yet, in spite of the world, there are a few better-tuned souls, that glow for that which is glorious and divine.

THE Alpine Philosopher takes leave, for a while, from his professional doctrines, to communicate to his readers the stamina of a discourse which he delivered to the Society for the Acquisition of Useful Knowledge, a few days ago. The subject was the "influence of religion in the progress of mankind;" an important subject, which seems to require powers and sympathies far superior to those of the orator. Yet, mean and scanty as these powers are, they may be of some use as conductors of that magnetic universal fluid that streams from the centre of love; their use may be likewise increased by the energies and sympathies to which they are addressed. Certainly, his ideas will not fail of being misunderstood, or even perverted, by the many. Should there, however, be a single soul that comprehends them, comprehends them not as a science is generally understood, but in the way that light is understood by the plants, which unfold the germ of their inward life to the mighty creative power, truly the Alpine Philosopher is richly rewarded for all his troubles. J. G., who not only shares with him the spiritual sentiments, but soars above him nearer to the centre, must of course understand him. But there are still human beings in existence, who, he hopes, will not misconstrue this doctrine. The *Shepherd*, of course, being a universalist, that comprehends in his vast bosom any thing and every thing, will find argument both to attack and to defend it, according to circumstances.

The human being is composed of three elements: two whose destination is to act as instruments, and the third

as principle. The one element is the human body, with all its solids and fluids, organs, and faculties. It may be named the natural element. The second element is that assemblage of judgment, imagination, memory, common sense, or intelligence, which is called the human mind, and should be called the spiritual element. The third element is that burning spark, which comes from the burning centre of life, and gives unity and direction to the two former elements, under the immediate influence of the centre. This is called the will, and ought to be called the divine principle. If we consider the centre to be divine love, the will is likewise divine love. The human being in whom this principle unfolds itself is a godlike being. The destination of the human being, as a being capable of improving, is to become godlike; the whole human family, in its highest state of perfectibility, is to become a family of children of God. In this sense the whole earth will be transformed to a new earth, and this new earth will be an earthly paradise. That is the beau-ideal, which the prophetic spirit of the past ages represents as the millennium. If we consider the progress in the single individual, we see that it proceeds from inward; which inward is not moved by spontaneity, but by a higher principle, that acts in a similar way that the light acts upon the plants, or the solar attraction upon the planets. I say in a similar way, because divine powers cannot be equalled with physical powers.

In fact we have the self-conscious consciousness of the divine power, but we have but a limited type to represent it. And as the type is not the phenomenon itself, but an analogy to the phenomenon, and this analogy is but intelligible to him who knows the phenomenon, the divine truth can only be made evident to him whose eye has already received the beams of the divine centre. Now, such is the nature of man, that he may or may not open his eyes to these beams. In a state of perfection, the centre in us, moved by the centre without us, would subject the intelligence to the divine principle, and the natural element to the spiritual.

In the state of imperfection, however, the two instruments attempt to elevate themselves one over the other, and thus to counteract the action of the divine principle. From this disharmony all individual sins and public woes are flowing. The rehabilitation of the human being, as well as the progress of the whole mankind, is only possible through the supremacy which the divine centre obtains over the two elements, the spiritual and the natural.

It is remarkable, that the systems of philosophy, theology, and politics, correspond to the three elements of man. Spiritualism and materialism, monotheism and polytheism, monarchy and republic, correspond to the two subordinate elements. Christ is the type of the divine love, or the centre of universal life. But the type has been falsified by amalgamating it with one of the two subordinate elements.

Yet among all these theological, philosophical, and political attempts, there has always been a call from the centre without to the centre within; it is to be found like the light, which is latent every where, and under all forms. True religion is in every body's own heart;

there is the church and the altar, the high-priest and the holy sepulchre.

Go within yourselves, and see whether there is any progress in you and out of you, otherwise than by the means of religion. Yes, the spirit of love, that moves from within, to find that sympathetic being that answers to our own sympathies, that spirit which bids the lover give himself up entirely to his love, and thus prepares the rings for the great chain of progress, the love which inspires the artist to animate the marble block, that is, religion.

THE ALPINE PHILOSOPHER.

THE PRESS AND ITS CORRUPTION.

Of the corruption of the press there can be no doubt. It is a prevailing disease; the offspring of original sin, which we all have inherited from our grandmother Eve, and her intellectual apple. It attaches itself to the highest and the lowest of our literary productions; to all works of opinion, which address themselves to the party spirit in politics or religion; to reviews, magazines, pamphlets, and newspapers, from the *Court Journal* down to the lowest and most ephemeral of the *Unstamped*.

But what is this corruption? for we mean to say a little in praise of it. Why, it is in one respect only a subserviency to the opinions and prepossessions, and peculiar dogmas, of a certain proportion of the public; a sort of representative character, which the editor assumes, in order to identify himself as closely as possible with the party which countenances him with its patronage. Sincerity on the part of an editor of a public newspaper is not what the public have any particular interest in promoting. An editor is merely an individual; he is subject to changes of opinion from various circumstances. He has his likings and dislikings; his personal antipathies and private feuds. He is a creature of caprice and imperfection (as every individual is, less or more), and the public have no general interest in the indulgence of his whims, or the amicable settlement of any of his disputations. In as far as respects these particulars, therefore, there is a necessity for keeping him under a powerful check, and universalizing his character by destroying his individuality.

This counter-check upon the editorial character, by the influence of public opinion, gives a peculiar and very interesting feature to the anonymous conductors of a public newspaper. Their personal responsibility is destroyed; the paper alone, the inanimate and insensate paper, is accountable for all the vices which its invisible and unknown authors have committed by its instrumentality. And these errors are the more easily corrected, that no individual has personally to answer for their commission. It is very easy to make an acknowledgement behind the curtain; to make a full confession in secret of all our peccadilloes; but it requires a thief's forehead to do the same in public, and meet the appalling verdict of the human countenance. For this simple reason a newspaper is not so dogged, so irrationally obstinate and consistent, as an avowed author, who, having made one egregious blunder in early life, will not unfrequently commit a thousand more, to give some plausibility to his former

undigested notions, and preserve what the world now so very highly appreciates—his *consistency*. A newspaper has no consistency, except that of mere tendency either to stand still, to retrogress, or progress; and it regulates its zeal, and the amount of its principle, entirely by the pulse of public feeling in that class of society by whom it is established. This is more than an individual could do without encircling his character with a halo of universal reproach, and thus destroying his authority and ability to lead and instruct the public mind. This is the pit into which the late Mr. Cobbett fell; he abandoned the editorial character; clothed himself with the most unblushing egotism, and always spoke in the singular number; consequently, every word which the *Register* contained became more identified with Cobbett himself than it would have been had it adopted the editorial system of *incognito*, which always enjoys the advantage of being regarded by the public as the production of more than one individual. There is not more inconsistency in the writings of Cobbett than is to be found in the columns of any political newspaper during the last thirty years. But the inconsistency of a paper is much less injurious to its reputation than the inconsistency of an individual; for the paper may have changed its proprietors and its editors, whereas the individual is still the same. Had Cobbett written anonymously, as a political commentator on passing events, and merely appended his name to his more classical and standard productions, his respectability and authority would have been more universally acknowledged.

The security which it gives to every species of public calumny is generally alleged as one of the principal defects of the public press. This, no doubt, is an evil to those who have their feet scalded by it; but if men are ambitious of high and honourable places of authority; of being exalted on platforms, hustings, benches, wool-sacks, and other conspicuous places, it is very necessary that such characters be so thoroughly armed with honesty, with good public and private characters, as to stand the test of every species of abuse. Slander is an evil when the motive is bad, and the consequences are subversive of public morals; but slander is not generally an evil; it is only disagreeable to the individual who is kept in check by this moral schoolmaster, and very often saved from an ignominious death, or some judicial punishment equally to be dreaded, by the fear in which this double-tongued demon has perpetually enthralled him. The slander of the public press is the terror of every public character; and so far are we from wishing to suppress this evil by any legislative or moral power, that we fervently hope that the *corruption* may increase more and more till all but men of genuine and unblemished reputation be deterred from accepting any public office. The slander of the press is the besom of reformation.

There are, no doubt, many species of corruption in the public press which we should like to see removed; but that species which the greater portion of the people imagine to be the most influential, namely, the government money and patronage, is the least of the number. This is an evil which will speedily cure itself. Indeed the public press is pretty well convinced now, that the govern-

ment patronage is rather a curse than a blessing. An opposition paper generally succeeds better than one which is under the wing of the minister. The public are disgusted with the servility of a ministerial organ, and very speedily fly to that which is unfettered, and free to lavish its abuse upon all men in authority. The greatest corruption of the press consists in the monopoly of capital, and the stamp-duty, which confine the management to men of wealth and power, who only speak the feelings of their own class, and do not identify themselves with the people. Observe the coldness of all the stamped papers upon the repeal of the stamp duty. Even the *Dispatch*, with all its boasted liberality, only pleases the people where it knows it can do so with safety to itself, and without any probability of accomplishing its ultra-Radicalism; and the *True Sun* knows that it can lose nothing by the destruction of monopoly. The greatest defect in the press is, that it is a *trade*, and will do any thing for money, either puff a poisonous medicine till it has created a plague in the country, or bury an honest man in oblivion and infamy, because its readers are prepossessed against him, or he is too poor to pay for an apology. When Mr. Owen was a rich man, the bulk of the London press was in his favour; their columns were filled with his productions as with a parliamentary report, or some ministerial document. Not that he bribed those papers; but he purchased them in cart-loads to distribute in the country. Now that Mr. Owen has spent his property in diffusing his principles, even the *Sun*, his old patron and stanch supporter, scarcely ever mentions his name. Cobbett would never take a bribe; but we know a Tory who persuaded him (after refusing a pecuniary bribe) by purchasing fifteen hundred of the *Register*. This number of the *Register*, in which was an article in favour of the West India planters and the slave-trade, was, perhaps, the only production of Cobbett which the Tories zealously circulated since he shone forth as the champion of William Pitt. There are many ways of being independent and mercenary at one and the same time. If men do not understand our universalism in profitless theory, they practise it very dexterously when they find it beneficial to their pockets.

We have a few more observations to make on this subject.

TO THE EDITOR OF THE SHEPHERD.

SIR,—The following lines are from an unpublished narrative of travels in Germany. If you join me in the opinion, that they tend to induce the habit of thinking out of the trammels of creeds and prejudices, I should be well pleased to see them in your very important columns.

A COTUSONA.

AND here the question presses, What is truth?
'Tis not the same, as seen by age and youth;
Else, inexperience would experience be,
And length of life have no utility.
Truth by experience only can be shown;
Till it be felt, it never can be known;
'Tis thickly clothed; the deeply-folded dress
Upon the inexperienced optics press,
And hide the fair proportions of the frame
In which reside the beauties of the same.

The naked truth but rarely meets the view;
The vulgar take the obvious for the true;
And hence their ignorance of every kind,
Their very gross stupidity of mind.
Oft but the wrapper of fair truth we scan,
And judge that we have views of Nature's plan;
On which we argue with our utmost force,
And think our neighbour must accede of course;
This, too, from one-side glances of some folds
Of Truth's rough outer garment: he beholds
Another set of foldings; calls them truth;
And claims our credence to his view, forsooth!
Thus, then, in warm discussions we engage,
And war, to press our separate notions, wage.
What is but part, we fancy is the whole;
That dress is man; that body is the soul;
Hence draw we false conclusions from the thing,
And on our careless minds gross darkness bring.

Imagine now a statue, and, around,
A hundred artists occupy the ground;
Each takes a drawing with the utmost care,
In just proportions, lights and shadows fair;
Compare these pictures: every one is true,
But none alike: each is a different view.
So in religious creeds; each view of Truth
Is drawn from one position; which the youth
And the unthinking, fancy is alone
The way in which the truth can e'er be known.

Innumerable statements may of things be made,
Which, in some sense, are true; the light and shade
In which they're thrown may give opposing hues,
And make harmonious seem discordant views.
Yet those who only think, will often see
How opposite appearances agree.
Truth is like a nut; the obvious is the husk,
Seen just as clear as prospects are at dusk;
Truth, deeper, is the shell, by peeling found;
Not had without some labour, thought profound;
But real inward truth is not attain'd
Till broken is the shell—the kernel gain'd;
And this requires great force; that, study deep,
Long contemplation, e'er pure truth we reap.
From close investigation, we shall prove
The real inward heart of truth is love.
Truth in innumerable forms appears,
Because encased by human loves and fears.
The highest truth is God's own love, in act;
This is the only real truth, in fact.
The love of God and neighbour will dispose
The mind to see this truth, and will disclose
The derivations which from this are made,
And show how light is cover'd with the shade,
Or truth by error sheathed, to veil its light
From dazzling and destroying human sight.
This sheathing is derived from selfish loves;
Thus dark apparent truth it only proves.
Self forms a mist, through which the truth is seen
More or less clear, as thin or thick the screen.
All the obscurities to self belong,
And darkness deepens as self-love grows strong.
The only mode by which we can obtain
A glimpse of truth, is selfhood to restrain,
And make it serve in aid of public good:
In no way else can truth be understood.
Try, if you please, a thousand different ways
Of seeking truth, while self its rule displays,
And you'll be surely foil'd; nor ever find
One ray of light to guide the erring mind.

Ponder this subject deeply ; weigh this view,
And then, perhaps, you'll own it may be true.
Reject it not because 'tis new or strange ;
Look well around it, take an ample range.
Its every bearing view, on every side ;
Relax not, for the question is as wide
As is creation ; every object bears
Or more or less upon it. Whoso dares
To think profoundly, from the trammels free
Of creeds or prejudice, may clearly see
The soundness of this statement, and may know,
From feeling, what I herein aim to show.

'Tis often difficult to well connect,
In common things, the cause with its effect ;
Need we then wonder that the mental eye,
When into things of spirit it would pry,
Should not see clearly all the various links
Of Heaven's external chain ; whoever thinks
With deep humility, and ardent love
Of truth itself, will draw light from above.
Truth to the humble only can descend ;
Pride's every motion must to blindness tend,
Because it seeks from self what self ne'er can
Impart, to light the steps of erring man.
Self gropes, is ever feeble and benighted,
Except when led by Heaven's strong powers, and
lighted.

GYPSIES.

As very erroneous ideas of the present state and manners of the Gypsies are pretty generally entertained, it may not be improper or useless to endeavour, in this place, as far as truth will warrant, to lessen the prejudices which exist against them. Though they have almost always been considered and described as rogues and vagabonds, and have generally been treated in all countries as such, the imputation rarely seems to rest upon proof. On the contrary, they who have so described them, have mostly admitted that they have taken their character on hearsay ; while those who have had opportunities of really knowing them, have generally affirmed that they have not found them to be such.

Pasquier, in his "*Récherches de la France*," gives an account of their appearing in considerable numbers in that country in the year 1497, copied from an old book written by a doctor of divinity in Paris. The description in many respects seems correct ; but the accounts which he says they gave of themselves, if they were Gypsies, were evidently meant to deceive those of whom they were afraid. He says, "they were the poorest and most miserable-looking people that had ever been seen in France ; yet notwithstanding their poverty, and seeming ignorance, they had women among them who, by looking into people's hands, told their fortunes. And what was worse, they picked people's pockets of their money, and got it into their own, through telling these things by art, magic, &c." He afterwards adds, "though this was the common report, I never lost a farthing by them, though I was with them several times." Pasquier afterwards says of his own knowledge—that the Gypsies had been wandering up and down, under the eye, and with the knowledge, of the magistrates, for more than a hundred years. At length, in 1561, an edict was issued, banishing them out of that country. They are said to be very numerous in Lorraine and Alsace, where they found shelter in the forests in spite of edicts and orders of council.

Twiss describes them as being in great numbers in Spain, particularly Murcia, Cordova, &c. "Their language," he says, "which is peculiar to themselves, is

everywhere so similar, that they are undoubtedly all derived from the same source. They began to appear in Europe in the fifteenth century, and are probably a mixture of Egyptians and Ethiopians. It is supposed that there are upwards of forty thousand of them in Spain ; great numbers of them are innkeepers in villages ; they are everywhere fortune-tellers. * * * * "Most of them have a smattering of physic and surgery, and are skilful in tricks performed by sleight of hand." In refutation of the charge of their being thieves, he says, "I have lodged many times in their houses, and never missed the most trifling thing, though I have left my knives, forks, spoons, and linen, at their mercy."

Swinburne says, that they swarm in the province of Grenada. All the Gypsies that he conversed with assured him that they were sound Catholics ; but they were not generally esteemed such. In Calabria he found great numbers ; he says of them, that they only contract marriages among themselves ; that they support life by profits of handicrafts ; but more by swapping asses and horses. That they generally work in iron, and make trivets, knitting-needles, bodkins, and such trifles ; that their religion is locked up in their own bosoms ; that they seem to have no great veneration for the Virgin Mary, but are supposed to believe in Christ ; that if the priests start any objection respecting marrying, christening, &c., they manage the matter in their own way, without giving them any farther trouble. In 1560 they were banished ; and again in 1569 and 1683, but with little effect.

Grillmann describes them as being found in all parts of Italy ; being most numerous in the dominions of the church, there being the most superstition, and the worst police. A general law throughout Italy forbade them remaining more than two nights in a place. This was found to be no great inconvenience to them, though it proved considerably so to the stationary inhabitants. He asserts, that the Gypsies are exceedingly numerous in Poland and Lithuania, as well as in Courland ; that they are found in Denmark and Sweden ; and that in Hungary there are upwards of fifty thousand of them. Cantemur says, that they are dispersed all over Moldavia, where every baron has several families of them. In Wallachia and the Selavonian mountains they are very numerous, as well as in Bessarabia, Tartary, Bulgaria, Greece, and Romania ; and that in Constantinople they greatly abound. They are spread throughout Russia in great abundance. In many parts of Asia they are very numerous. Grillmann supposes that, on a moderate computation, the number of Gypsies in Europe and Asia may be seven or eight hundred thousand. The probability is, that this is very greatly under the mark. In "*An account of Wallachia and Moldavia*," lately published by William Wilkinson, late British consul to those two principalities, it is stated, that there are in them alone, at this day, one hundred and fifty thousand Gypsies.

When Gypsies originally arrived in England is very uncertain. They are first noticed in our laws, by several statutes against them in the reign of Henry VIII., in which they are described as "an outlandish people, calling themselves Egyptians ; who do not profess any craft or trade, but go about in great numbers, from place to place, using insidious and underhand means to impose on his Majesty's subjects, making them believe that they understand the art of foretelling men and women their good and evil fortune, by looking into their hands, whereby they defraud people of their money." It then proceeds to lay a penalty of forty pounds on any one importing any such Egyptian. During the same reign numbers of them were shipped at the public expense to

France. They were calculated then to amount to ten thousand in England. Repeated statutes have since been passed against them, but with little effect. In Scotland they appear to have been much more numerous. In almost all countries in Europe severe enactments against them have, at different times, been passed; such enactments, have, however, in no instance been attended with the desired effect. This may easily be accounted for: in the first place, they were not possessed, like the Jews, of property to repay their persecutors for the trouble and expense of prosecution. They had no natural home to which any country had a right to send them; and in the next place, their habits of life were such, as to enable them almost to set at defiance all such efforts to expel them. No part of the country was too desolate for them to exist, or even enjoy themselves in; and in those days such desolate parts were to be met with abundantly in every country. Hence it has been, that all attempts to expel them have always proved abortive.

From the knowledge which they seem all to have possessed of every region in which they have been first noticed, it is evident that they must have been, at that time, long resident there. They were not only acquainted with the languages of each nation, but they appear to have been well apprized of the several failings of the inhabitants. They had the sagacity to discern, and the ingenuity to take advantage of, their several weaknesses. They had likewise taken up the practice of such trades as were adapted to their own habits, and likely at the same time to afford them a livelihood in their adopted country. These things evidently prove that their residence in the different parts of Europe must have been many ages prior to any account of them which has reached us.

There never appears to have been any surmise of their origin being different to what they themselves assert it to have been, viz. Egyptian, but one, and that seems only to have been taken up on the ground of some similarity of language; that one is, that they are of the lowest caste of Hindoos from the East. This similarity of language does not militate against their descent from the ancient Egyptians, as it is not improbable that both languages, viz. the Egyptian and Hindoo, may have sprung from the same root. This supposition, as being the only one at variance with that which I have adopted, it may be well to examine; especially as it has been taken up by most late writers on the subject. On this supposition, a miraculous interference has never been pretended; it must therefore rest on its natural grounds, and on them, I think, it may be shown to be impossible.

The Gypsies have, by the above-mentioned writers, been supposed to have been *Soudras* driven to forsake their native country by the cruelties of Timour Beg, in the years 1408-9. The affinity of the two languages is the only ground on which this opinion is supported. The only evidences of this which have been adduced are a list of a few words which sound something alike in both languages. No single according sentence has yet, I believe, ever been produced. Now it is evident from the Gypsy language being still the same with them in all countries, that it has not changed, nor is it probable that the Hindostanee has been materially altered; if so, the *Soudras* and the Gypsies could understand each other; but it has never been asserted that they do. It is by no means improbable, however, as before noted, that on the supposition of the Gypsies being from Egypt, the two languages may have sprung from the same root.

Against the Gypsies being *Soudras*, or any caste of Hindoos, the following reasons may be urged as conclusive:—It is well known that the *Soudras* are, and always

were, among the most abject of the human race. Oppressed and spiritless, held in abhorrence, and treated with contempt by all the other castes of their countrymen, their touch, and even presence, being considered as contaminating. Now, though it is possible that such a people as this might be roused by oppression to resistance, and, if successful, to take signal vengeance on their oppressors; it is not possible that they should be the first to fear or to flee a revolutionary conqueror. No change could render their condition more intolerable: any change might make it better. In all probability, they would be the first and the loudest in lauding a successful adventurer, and the last to flee from him, especially to seek refuge they knew not where, and from they knew not what.

Suppose, however, for argument's sake, that tens, if not hundreds of thousands, of these poor wretches had determined to fly from their native country, and men, women, and children, all born slaves, had been suffered to depart, whither were they to go? It is not probable that they could know of any country beyond their own; much less could they know the way to Europe; and yet they must all have immediately combined in one systematic plan of operations, to emigrate to that distant quarter of the world. But suppose this all done; they must, at any rate, have to travel through Persia, Arabia, and Egypt, more than two thousand miles. Suppose that six or eight hundred thousand half-naked defenceless wretches could have been suffered to cross these extensive and populous countries, how were they to be subsisted on their way? No country, unprepared for their reception, could, if inclined, provision them. But suppose that they had, by some means or other, reached the shores of the Mediterranean, what possible inducement could they have for crossing it? They could know nothing of countries lying beyond it. If, however, they were resolved on the experiment, where were the ships? Hundreds, solely appointed for the purpose, would have been necessary. If they had, by any imaginable means, got to Europe, they must all have then agreed to divide, each party having their own station appointed them, and each party must travel to their respective countries, even to the utmost peninsular point of Europe; and all this without any of them knowing the language of any one of the very numerous countries through which they had to emigrate.

The idea of the possibility of such a case does really appear too absurd to be sincerely entertained. The objections, however, against it, are far from being yet all stated. The manners and the customs of the two people were, from the first, as dissimilar as light and darkness. The *Soudras* are the most abject of the human race, cringing before all other men, as creatures of an inferior nature; submitting without resistance, or even complaining, to the vilest offices and the most tyrannical treatment. The Gypsies, on the contrary, from the first accounts of them which have reached us, being soon after the time of Timour Beg, have been distinguished by a most unconquerable spirit of independence, and an untameable love of liberty. This spirit has never been conquered, this love has never forsaken them! The *Soudras* were as ignorant as they were abject. The Gypsies have always been distinguished for ingenuity, a knowledge of the world and of human nature, which has enabled them to take advantages of circumstances, and to profit by the weaknesses and prejudices of others.

The ideas of the *Soudras* on religious subjects would be the most gross that could be conceived. Those of the Gypsies are the most simple: they have do idols, no religious ceremonies, nor any superstitious notions or observances. This circumstance (miraculous intervention

out of the question) must preclude the possibility of the Gypsies being originally Hindoos. The multiplicity of the gods of the latter people is, perhaps, beyond all comparison greater than those of any other; yet tens of thousands of the most ignorant of these superstitious idolators leave their own country together, they separate into distinct clans, all carrying their household gods with them, and disperse into diverse countries, never seeing each other more; yet every clan, as by common consent, casting away from them their gods, their superstitious observances, their idolatrous worship, and all of them becoming, at one and the same time, free, not only from their own forms of religious worship, but from all forms whatever. This does seem to be utterly impossible! This freedom from idolatrous worship is indeed of itself a circumstance so totally contrary to all that experience has shown us of human nature under similar circumstances, that nothing less than miraculous interposition is sufficient to account for it. On the supposition, then, and on that alone, of the Gypsies being the descendants of the dispersed Egyptians, can these difficulties be got over.

We know that the Jews coming from a neighbouring country to Egypt, have continued to this day a distinct, though dispersed people. Supposing, then, a divine interposition, there are no difficulties attaching to the state of one people more than to that of the others.

Of the works of that long-lost people, the ancient Egyptians, the more they become known, the more astonishing and interesting do they appear to be. Most awful and impressive is the lesson, which, under any view of them, they afford to this generation; but how exceedingly would the awfulness and impressiveness of that lesson be increased, should it appear that the houseless, friendless, despised, and persecuted Gypsies, who have for ages lived and been held amongst us in contempt, are the descendants of the very people by whom those mighty works, at which we are so astonished, were formed! It would almost seem as if all these discoveries had been permitted to be made, and this attention to be excited at this time, to increase the interest which this people now claim. They have hitherto excited little curiosity, yet they have always asserted that the land which contains these stupendous works, was the land of their forefathers. In making this assertion they could not be actuated by any self-interested or improper motive. They knew nothing but the name of the country which they claimed as their own. If that claim conferred any thing upon them, it was only additional contempt.—*Parallel Miracles.*

COMMON GOOD.

Common good is a divine in-birth, or a god-begotten quality, taking the word God in its best acceptation.

Man under his first birth cannot bear and bring forth the common good.

Man, as mind, under the second birth, being born of the unborn, is then in a state to bear and bring forth the common-good quality.

Man, as mind, under his second birth, holds a primary relationship with unity, a relationship of quality.

Man, under his first birth, holds a secondary relationship with unity, a relationship of quantity.

The secondary man not being under the primary relationship, tries to improve himself scientifically, by scientific institutions and mixed experiences.

Whatever the secondary man does scientifically by scientific institutions, only ends in secondary consequences, in quantitative results or mixed experiences.

A second-rate workman only can by his materials bring forth second-rate work; a work of quantity, or a work in which quantity rules.

A first-rate workman can and will with his materials bring forth a first-rate work; a work of quality, or a work in which quality will dominate.

Man, as mind, to be a first-rate workman, must be born of the unborn, born qualitative, so that he may co-operate with unity, till he bears and brings forth common good, as the divine in-birth, or quality.

A change from the outward primary birth, to the inward secondary birth, should be looked for with earnestness.

Outward things must give way with the old outward life, that the inward qualities may come forth with the new inward life, as divine consequences.

The old outward life, acting with outward things, must necessarily bring forth outward consequences; it cannot bear inward consequences or unmixed experiences.

The new inward life, co-acting with unity, must necessarily bear and bring forth inner qualities, as inner consequences; it cannot bear and bring forth outer qualities, as outer consequences.

Man's primary relationship with unity is co-active, simple, and inward; and his secondary relationship with unity is re-active, compound, or outward; by the first relationship he bears and brings in the inner co-active qualities; and by the secondary relationship he bears and brings forth the outer qualities, or re-active objects.

Within man are co-active qualities or agencies; without man are re-active quantities or objects.

As soon as man's co-active qualities or agencies within him are doubled, and ranked in a primary relationship with unity, the re-active quantities or objects, which are of a secondary relationship, and about him, do not overbear, but sustain, their comparative and relative estimation and position.

The primary co-active relationship, when fully established with unity, will increase the secondary relationship, the re-active or repulsive, and bring about by a divine in-birth the common good, the universal harmony.

Man in his essence is a co-active, in his relations a re-active, in his essence a simple, in his relations a compound or mixed, being.

In his essence unity and quality inhere essentially; in his relations divisibility and quantity adhere circumstantially, or confusedly.

Man's primary relationship with unity is not yet established in simplicity. J. G.

The Alpine Philosopher to his Correspondents—

Many interesting letters and questions, philosophical, theological, and medical, have reached him at the moment when, by the marriage and subsequent leaving town and partnership of his worthy friend, G.D., he was thrown into a labyrinth of earthly vexations and broils, and, consequently, remain unanswered. A manuscript of great importance has been also transmitted to him, which he has placed in the hands of a most intelligent friend.

The Alpine Philosopher rejoices to see every where the manifestations of spiritual regeneration; people begin to doubt the truth of the exclusive systems, whether atheistical, deistical, or sectarian. That is the morning dawn of the inward light. To those who wish to have farther communications with the Alpine Philosopher, he begs to invite them to direct their letters, or come personally to 108, Park-street, Albany-street, Regent's-park.

The Society for the Acquisition of Useful Knowledge has removed to 18, Store-street, Bedford-row. Meets on Monday evening next, afterwards on Tuesdays.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 46.]

SATURDAY, JULY 11, 1835.

[Price 1d.]

SYSTEM OF NATURE.

THE separation of heart and affections which has been accomplished in the world by the limited ideas of local religions, prejudices, and interrupted intercourse, is a most interesting and instructive subject of contemplation. And it is curious to observe with what certainty every individual nation, tribe, or sect, appropriates to itself the monopoly of moral and religious rectitude, and the approbation of Heaven. All history is full of this curious fact. The name of a Samaritan was an abomination to a Jew, and the name of a Jew to an Egyptian. They would not even eat at the same table with each other. The same antipathy still exists amongst the Indian castes, which would suffer profanation bad as death itself, by associating with one of inferior order. The Mahometan is equally contemptuous in his treatment of the Christian, and would regard his mosques as desecrated by the presence of a follower of Jesus. The Jew has been universally abhorred by the Christian world. The nerves of many a pious Nazarene even yet thrill with horror at the sight of a genuine descendant of Abraham; and an infidel is a moral reptile, whose very presence would destroy the cheerfulness, and oppress the feelings of a very large proportion of modern sectarians. The Churchman despises the Dissenter, and the Dissenter hates the Churchman: the Unitarian dislikes them both. The separation of love is as multiplex and interminable as the separation of interest. It is not confined to large parties only, but subdivides itself to infinity, throughout all the ramifications of individual life.

But this separation is not peculiar to religion alone; it has a political character also. Nations of old abhorred each other on account of their diversity of speech; they were esteemed barbarians by each other, and despised for a jargon which rendered intercourse impossible. They therefore only met to fight. There were national antipathies created by distance, and by natural divisions of territories such as lakes and mountains, which caused everlasting quarrels; and there were feudal antipathies which arose from different monarchies or baronies, and there were municipal antipathies, which arose between the inhabitants of different towns. Many of these still remain amongst us in considerable strength. There is a nationality about us all which we cannot thoroughly get rid of. An Irishman has a peculiar predilection for his own dear island, and the sons and daughters whom she rears. An Englishman, a Scotchman, a Welshman, each at times, however liberalized his feelings may be, delights to hear the praises of his mother-land; and not only the land at

large, but the county, or village, or town, or city in particular where first he breathed the breath of life, or spent his infancy and his youth. This predilection descends still lower and lower, to his own parish, his own kin, his own home, his *own self*, where it all centres, and from which it all sprung.

The circle of this home-love is widening daily by the intercourses of life in the facilities of travelling. The peculiarities of the inhabitants of different provinces are becoming extinct by universal amalgamation. It is chiefly in the small towns and agricultural villages, and amongst the yeomanry of the country, that the old characteristics are discernible. In large towns the population is a heterogeneous mixture of all counties, towns, and villages. London is a sample of all the three kingdoms, and all the provinces which they contain. There is not a town, scarcely a village, in the king's domains, which has not its representative here. Here we have all sorts of brogues and flippant lingos, dialects, and provincialisms; all sorts of manners, rude, refined, civilized, and barbarous; and inferior cities are similarly stocked with their living inhabitants. Cities thus become a sort of alembic for mingling the different contradictory ingredients which make up the sum total of the kingdom; and London, being the metropolis of all, becomes the final reservoir in which this heterogeneous mass of humanity is commingled. The process of universalization is thus going on involuntarily by this tremendous concourse of every species of mind and manners; and, therefore, it follows that London is necessarily, from the mere circumstance of its magnitude alone, more advanced in the spirit of liberality and universalism than any other part of the country. In no other city but London could such a work as *The Shepherd* have made its appearance. We have attempted to introduce our doctrine to the public both in Edinburgh and Manchester, without success. Even the press of the "Voice of the People" refused to print a discourse, which contained nothing more obnoxious than is to be found in the columns of *The Shepherd*. We were advised to send it to Mr. Carlile, in London. And pray, why go to London, the seat of government, to propagate doctrines subversive of the faith of the country, and consequently subjecting the writer and the publisher to legal prosecution? Merely because here there is a greater proportion of liberalized or emancipated minds to extinguish the moral odium of the publication, and consequently to divert the attention of the public and the magistracy from its contents. But what is there, the reader may ask, in *The Shepherd* to offend the laws of the country? Only this: it teaches the *unity* of God and Devil, and that is

blasphemy. Ten or twelve years ago we should have been prosecuted for our doctrine; but thanks to Carlile, Taylor, and Owen, we are now perfectly safe, and have no other fear upon us than that the bigotry of the people.

Whatever evil, therefore, there may be in large cities, it is evident that in the present state of the human mind, they are the source of all the liberality and universalism which exists. Any species of political innovation which would destroy the centrality of London, as the sole metropolis of the kingdom, would retard the progress of the public mind to a most appalling extent. There is probably no better scheme which the Tories could invent to strengthen their own dying cause, than the adoption of the plan proposed by Mr. Cobbett, of removing the seat of Government from London to York and Salisbury in succession, if that plan was meant to diminish the magnitude and destroy the centrality of London. For by this process the inhabitants of London would be divided into three, and the place itself reduced in political consequence in more than a similar proportion. If so, what would become of the public press? How would the vanguard of opinion in politics and religion find a vent to express itself? It would be subdued in the same simple and effectual manner here as in the provincial towns and cities, where it is obliged to skulk in holes and corners, and crawl along in nervous agitation, amid a host of ecclesiastical and political cormorants. What can Germany do with her divided principalities and insignificant cities? With all the enthusiasm and genius which distinguishes that extraordinary people above all the nations of the globe, Germany is totally lost in the world of progress. She is lost to other nations, however, only because she is lost to herself. Where is the capital of Germany? Where is her emporium or metropolis of literature or of power? No where. Therefore her people are in a state of hopeless subjection; the prey of an associated host of haughty barons, who are safe from the fears which agitate the rulers of more extensive domains; for the influence of the public mind is suppressed for want of a centre of popular attraction. This is the secret of the political insignificance of Germany, and the retrograde movement of Italy, in the destruction of the supremacy of the city of Rome by the temporal emancipation of the Grand Dukes of the country from the pontifical authority. Not so enchained are France and England, because they are differently constituted; but a diminution of popular strength would be the immediate consequence of a reduction of their capitals. The magnitude of London is the salvation of England. The French are before us in the "feeling," but they want the power. London would give them a power which Paris cannot exercise. Were London in France, and Paris in England, the French would soon put a fool's cap on the head of their king, and give him his discharge. But it is reserved for the *largest* city to finish the work of reformation, and commence the reign of the people. There is greater liberty of speech, and of the press, in London, than in any other city in the world.

But what is the reason of this superior power and liberality which prevail in a large metropolis? It is the *principle of universalism*, or the union of all the sects and

parties which exist in the surrounding country. These sects and parties are not cordially but locally united in the metropolis. Their antipathies are equally as strong in London as in the provincial towns; but the combined influence of all upon the country is such as to produce a sort of harmonious result of the general spirit of the public. Even the sects themselves, without perceiving or being conscious of it, are gradually imbibing spirit and character from one another. The Churchmen are less intolerant of Dissenters, and the Dissenters more moderate in their denunciations of Churchmen. They view the subject of Church and State more as a subject of political economy than a theological question; and the Infidels themselves have equal reason to boast of their impregnation of faith itself, almost universally throughout the large towns, with many of their own peculiarities. This is evident from the fact, that the exclusive spirit of sectarianism is dying, and only nominally preserved in a great majority of cases. This arises from an indifference to the leading points of controversy, and a persuasion being spread abroad throughout the religious world, that a man's worth ought no longer to be determined by the standard of religious creeds, but of public and private usefulness. This is merely the Infidel principle of works which is gaining ground upon the opposite principle of faith—not that the infidelity is supplanting the faith, but correcting its excesses by its own moral principle, whilst faith keeps the spirit of infidelity in check, and prevents the havoc it would otherwise create by its heterogeneous disunited mass of destructive novelties.

If, then, such be the beneficial result of merely a local approximation of different sects in subduing the bigotry and destroying the exclusiveness of the human mind, what must be the consequence when that approximation is not merely local by juxtaposition of habitation, but what is of much greater importance, a moral and intellectual proximity, by a communion of thought upon universal subjects? The one gives us but a very faint shadow of what the other will effect. The city is the type which prefigures in the liberality and charity to which it partially and involuntarily gives birth, prefigures the perfect regeneration of mind and affections, which must be the ultimate result of that universal amalgamation of thought to which we have given the name of *universalism*, on account of the all-inclusive nature of its principles. Universalism is the spiritual and intellectual capital of the mind, in which creeds of all denominations congregate and correspond; and, by the conciliatory influence of social life, make such discoveries, both moral and doctrinal, respecting each others peculiarities as would have been utterly impossible in the limited circle of a sectarian region. It is upon the principle of a metropolis that we proceed, and no other: we don't say, this shall not come in, and that shall not come in; we have an open door for all, and especially an *influence for all*; and this is the distinction which is peculiar to universalism, a distinction possessed by no other doctrine ever taught by man. Every party receives proselytes; but as it receives them it destroys their former doctrines, and puts an everlasting extinguisher upon them. Universalism will preserve these doctrines alive for ever, and employ them as a check

upon every species of extravagance, even when every kind of dogma has been politically and socially amalgamated by name into one universal Church and State. The different dogmas themselves will mentally preserve a separate existence, as rudders to direct the course of thought, and beacons to warn it of approaching danger. Man would be a mere brute without them.

THE SHEPHERD.

ON MENTAL DISEASES.

LETTER X.

Bound on a voyage of awful length,
And dangers little known,
A stranger to superior strength,
Man vainly trusts his own.

But oars alone can ne'er prevail
To reach the distant coast;
The breath of heaven must swell the sail,
Or all the toil is lost. COWPER.

I HAVE often seen, and indeed my own experience has often told me the bitter truth, that man, by all his best endeavours and gifts, is dragged, as it were by some invisible power, into such deep soul-and-body-snatching whirlpools, that there is no salvation for him, unless this salvation comes from above; for the generality of men, even those who pride themselves on being high-minded and liberal, instead of lending a helping hand to him who is sunk in the dangerous pit, like Job's friends, turn their poisonous tongues against him, and, in like manner as the Jews exclaimed against Christ, they exclaim against the poor wretch, "Crucify him! crucify him!"

If this be the case, what wonder if so many of the most aspiring, talented, and high-spirited men, seized with temporary insanity, disgusted with the infamy of the world, put an end to their own existence; or, assailed by still deeper woe, cease to exist as rational beings, and live a lingering melancholy life—the life of madness. In such cases, I consider madness as a real providential act, by which man is protected against the bad influences of those uncharitable, perverse, and poisonous reptiles that call themselves superior, rational beings.

I must confess, that sometimes, myself, when struggling with perplexities, and overwhelmed with the ribaldry and cruelty of mankind, I was induced to pray unto God to take away from me my life, or my mind. But those the power from above has never resorted to.

But, be it that my inward life was more powerful than all exterior circumstances; or, as I rather suppose, be it that my firm belief in the eternal bourn of love, animated with fresh strength my sinking power, I have always found myself stronger and bolder after each fall.

Yet, that I have been more fortunate than many in the great struggles of life, makes me no less capable to enter into the very stamina of the feelings of those who, under similar circumstances, have lost their reason.

The ancients, who stood much nearer than we do to nature, had fully understood this kind of madness. Prometheus and Oedipus are the two most graphic and masterly pictures of this terrible disease; indeed the whole

family of Tantalus affords a succession of tragical instances of the same disorder.

In modern times, with the exception of the poet Tasso, and some heroes of the French revolution, this form of madness is chiefly confined to religious-enthusiasts.

I have paid strict attention to a great number of cases that fell under my immediate observation; and I can say with truth, that, in the beginning, this error was generally the consequence of some invisible power; yet if men had not acted as visible demons, the error would not have led to madness, and to horrible actions committed in fits of madness. But the obstinate opposition, sneering contempt, cruel exposure of human frailties, calumny and slander, of friends and relations, have turned the transitory error into a fine idea, and perverted a badly directed divine spark into a Satanic fire-flame. I have never yet succeeded in curing any of them, because I have seen them always in that state in which ill-treatment had rendered them incurable. However, if I had the means, I should make new trials. I think that by leaving them quiet and unmolested, in pleasant solitude, the inward life would by degrees unfold itself. Instead of any spoken language, I should employ music and pantomimical representations. The diet should be entirely vegetable; the drink pure water: in some cases, milk. They ought never to be spoken to; never visited; and even the waiting-men ought to observe the strictest silence. Except in cases of imminent danger, all medicine should be banished.

A Roman gentleman, having written his own will, ended it with the following words: "Let no lawyer approach"—"*Abstet jurisconsultus.*" If I ever succeed in establishing an asylum for the insane, I would imitate the good gentleman, and have written at the gate, No physician allowed to enter—"*Abstet medicus.*"

THE ALPINE PHILOSOPHER.

A FACT.

THE following story was told us by the Man in the Moon. We recommend it to Mr. Owen as a "fact."

"A few days ago I was peeping over the horns of the moon's fourth quarter, and making observations upon the different passengers which are everlastingly thronging from the world below. They were driving along in all sorts of vehicles, according to the character which they maintained, and the moral ascendancy they had acquired by the cultivation of their minds in the first life. You must know that the passengers' fares are not paid by money, as in your dirty slop-hole below. If a man has worth in his looks, and in his deportment, he mounts at once, like a gentleman, and cuts through the air with all the dignity of nobility itself. No importunate coachman, guard, or hostler, disturbs the cogitations of his brain, or spoils the pleasure of his aerial tour. If he be a vile, ungenerous wretch, with a heart that beats with sympathy only for his own kin or his own caste, he is like a man in your world without money in his pocket, and he must trudge it along as well as his knees and his ankles can afford. The ground was covered with such wretches. Lords and lordlings, ladies and ladylings, of every de-

gree were walking on foot, while labourers and tradesmen, with folded arms and tranquil countenances, were scouring past them in flying vehicles, which very speedily left the foot passengers in the horizon behind.

"The rapidity with which some flew was astonishing; they were at heaven's gates in a twinkling; whilst those who walk take many years to perform the journey, and arrive at their destination in a state of fearful exhaustion and pauperism. Castlereagh has only just got in; he has walked all the way; he could not afford to ride. Old Cobbett overtook him at the gate just as he drove up on the top of an omnibus. "What ho, Paddy!" says Porcupine. "What the Devil—" and just as old Porcupine had uttered these words, he saw the Devil himself peeping out from behind the sentry box. "There's a bloody old rascal," says Porcupine.

"He now dismounted from the vehicle, and advanced to St. Peter's Court, where the crowd was thronging for tickets of admission. The Court was sitting, and several thousands of individuals were in anxious waiting. Some were returning with countenances pale, and eyes sunk with disappointment; their claims to immediate entry were rejected. Some were acknowledged to be very good souls in *private* life, but d—d rascals in *public*, as the Judge maintained, and were therefore doomed to sweep the road, as the souls of the poor whom they had oppressed below advanced in triumph through the everlasting portals. Others were sent back in the returning vehicles, and ordered to be left to find their way back again on foot. Many other curious punishments were inflicted, which made the foot passengers tremble with alarm. Those who came in carriages were admitted without examination. "It's a d—d shame," says Castlereagh to Porcupine; "who would have thought that such corruption would have been practised at the very gates of heaven? See with what ease these carriage parties obtain entrance! No questions asked; no tickets required; not even a suspicious look; all obeisance, smiles, and bows, and reverence, on the part of the Janus who presides at the gate; but look at that poor wayworn foot passenger, who has been so bold as to attempt to enter with the proud. The beadle has already caught him by the throat, and kicked him aside, with an application to his bottom, which no gentleman can bear without burning like hell with the spirit of revenge. I'd sooner cut my throat again than run the risk of it." "Now, Paddy," says Porcupine, "don't you know that this is all fair play? It is just the same sort of justice which you yourself sanctioned and practised below. Were not the nobility and gentry of England entitled to all such privileges by virtue of their wealth and their splendour alone, whilst a poor man was hunted with suspicion wherever he went? The soldier pushed him aside with his bayonet, and the constable with his baton; the doors of palaces and courts, except police and criminal courts, were shut against him. Even the pews of the churches were locked by the rich, for fear he should desecrate their cushions by his unholy touch. There was no virtue in poverty, or in a seedy coat; but a man of rank and wealth, though the greatest boroughmongering scoundrel in the country, as murderous as an Irish parson, or as corrupt as a Liverpool or Stafford elector, was saluted by the very same reverence; mark ye, Pat, saluted by the very same reverence that you see before you. It is a law of Nature, man, that worth be so treated." "Worth! Do you call me less worthy than they, because I have been obliged to walk on foot?" replied the other. "Certainly," replied Porcupine; "you could not pay for your passage, and that is a test of worth every where. When a man was poor in

the world below he was accounted worthless, and it is so here also; only in the nether world it was a paltry piece of dirt called gold which was the criterion; here it is a finer material; an inward, spiritual, and intellectual refinement; a feeling of universal sympathy and justice; and that, Paddy, I always told you you wanted. I am sorry for you; but I fear there is no hope unless you take to your old fawning, courtly tricks, and curry favour with that old hairy scoundrel who is peeping behind the sentry-box." Castlereagh looked—the Devil gave a smile and a wink. The wily courtier smelled a rat. "By Jasus," he says, "I shall accost him fair. He has some influence here, and it matters not to me how I get in, if I can merely escape the rude touch of that villainous beadle." "Don't you know," said the old sentinel in black, "that if I do not claim you, you have nothing to fear; and I can clothe you anew from head to foot. All that I demand, in return for this favour, is 'homage.' Kiss your hand, and bend your knee, and d—n the beadle and old Janus too." Pat caught the idea in a twinkling; it was congenial to his nature. He paid his homage, and in a trice he found himself in the garb of a gentleman, and walked in unsuspected. "By the spirit of the *Register*," says old Porcupine, "my work is not over yet. God has not made us for idleness in this upper world, as the parsons taught us. Since there are spiritual rats, we must have spiritual terriers. God be praised! I am glad of it. It was one of the greatest objections I used to have against Heaven, that there would be no boroughmongers, and *bloody old Times* there; no *Peel's Bills*, nor *paper currency*; no *damnable Six Acts* and *Sturges Bourne's*. I shall announce a weekly *Register* and a *Gridiron* as soon as I am fairly settled in my new quarters, and ferret out the vagabonds to their darkest and most secret holes, beginning with that *bloody old scoundrel* that winks behind the sentry-box."

"As the old man uttered these words a new vigour appeared in every muscle; he almost danced for joy, and entered the portals with the air of an enthusiast, eager to get a glimpse of the new system of politics into which he was entering, and above all things to detect the weak points, that he might devise a plan of attack upon the Whigs and boroughmongers in the world beyond the moon."

Such is the story, just as we have received it; but we cannot vouch for the truth of the *whole* of it, as the man in the moon is a notorious liar, and somewhat affected with lunacy, the effect of the circumstances in which he is placed, the peculiarly changeable climate which he inhabits. He laughs at consistency, and considers *exclusive truth* as an absurdity. "Thus, for instance," he says, "there are not finer productions in any language than *Æsop's Fables*; but they are notorious lies. Why put these into the hands of children, if your own conscience does not testify against your rationalism, that lying is useful." We could not gainsay this insane logic. The man in the moon is right. Lying is not always a vice, and therefore cannot be entirely abandoned. It must be refined and perfected with the rest of the fine arts.

A MAGAZINE ARTICLE.

"Waste not thy time in attempting impossibilities."—*A wise Saw.*

AND now to try my pen at an article for the Magazines. But what the subject?

Faith, till putting pen to paper, I never considered of that, and, like Echo, I reply, "What the subject?" Let me see; a *tale*? Why, aye, a tale is a very good

thing in its way; but, unfortunately, to perpetrate aught of that kind requires the co-operation of genius and invention. "First catch your hare," says Mrs. Glasse; "first conceive a plot," saith the *lex* literary. The abovementioned adjuncts I am not gifted with, consequently obedience to the law quoted is impossible.

Fair and softly! Can I not light upon some obscure anecdote, some forgotten legend, or some family record which, with the aid of a *little* talent for amplification, may be worked into a historical or domestic story not altogether destitute of amusement?

Decidedly no.

To accomplish such a task, I must draw aside the curtains of ignorance which continue me in the darkness of early ages. I must learn the localities of the spot where my scene is laid, with all the traditions of the place. I must inform myself of the domestic history of the spot. I must know the character of the times, and the characters who flourished therein. I must acquire a knowledge of the then state and condition of society, its mode of speech, familiar expressions, dress, amusements, and customs. In addition, I must be thoroughly acquainted with the chronological order of historical events, in order to avoid anachronism, and with the co-existing state and relative position of foreign countries, as nothing tends more to heighten the interest of a reader, or keep awake his desire to pursue your narrative and receive information with amusement, than constant allusion to realms and circumstances with which his acquaintance may be but limited. Furthermore, I must be enabled effectually to appeal to the passions, the sympathies, and the interests of my readers; to curb, when necessary, my imagination in its richest adolescence; to know where to curtail, and to know where to dilate; where to be grave, where gay; and finally (the hardest task of all) to know where to suppress a happy thought, when its introduction would prove irrelevant or impertinent,—none of which matters do I know anything about.

But surely in the course of my reading I must have acquired a sufficient, though superficial, knowledge of such things to enable me to gloss over a magazine article, and cheat my reader into a belief that I am well acquainted with the matters touched upon.

No, no, no! Such might avail me in a paper for one of the tag-rag and bobtail periodicals; but it won't do with the magazines.

Stay, though; I have urged no objections against a purely domestic tale, one unconnected with history or a display of public manners. No, but fifty (in addition to the absence of inventive faculties) present themselves. In the first place, that field of literature has been strewn with such a succession of gems, from the Vicar of Wakefield to the less-pretending but still precious productions of Irving, that it requires no common penetration to discover, or judgment to select, an unoccupied space. In the second place, should the primary difficulty be surmounted, an ornament altogether different from those adjacent must be employed to deck the vacant ground, otherwise there will be no distinguishing mark to characterize it from the rest. The question, then, naturally arises, Where am I to dig? In what department of the geology of literature am I to search for this novel gem? To this the answer is, for me, too obvious: I must penetrate the strata and substrata of the *mind*; consult the chapter of idiosyncracies, which, concentrating in our natures, undergo a mental metempsychosis, and like the clay hardening into stone, come forth in the new shape of motives, opinions, and impressions. It is by the study of these almost unfathomable branches of meta-

physics, and a masterly admixture of their ingredients alone, that I can hope to transfuse an original tincture to everyday circumstances, or such as have been touched by other hands. Twelve drugs may be compounded a million ways for the restoration of health, and twelve components of our moral structure may be placed in various combined and juxta-positions, so as to produce a million motives for acts alike in tendency; but, in the attempt to describe, a plummet to sound these motives is requisite, and, God help me! I can scarcely penetrate the actuating cause of a sick man's taking an unpleasant draught.

Without a well-tryed pen, much information, much genius, and much power of analytical development, then, the attempt to write a sound, able, fame-demanding tale is absurd.

What if I turn my "Perry's patent" from creation to animadversion, from tale-writing to tale-reviewing? Ah, no! the galled feelings arising from a conviction of my own incapacity would excite too strong a sensation of envy against the "genius-gifted," to permit an unprejudiced review; whilst my narrow views of things in general would leave me powerless in an attempt to follow, understand, elucidate, or explain the broad philanthropic, though oftentimes fanciful, speculations, or the expansive wing of *mind* takes its free flight, uncontrolled by those petty considerations which clip the pinions of the vulgar thinker. Again, not having read any of the arguments with which ancient errors have been overthrown, how am I to know whether my author in taking received opinions for his premises, may not be advocating and perpetuating absurdities, the removal of which had proved one of the most herculean achievements in the war against ignorance and superstition? It requires an age effectually to efface the stain which error leaves upon the unreflecting multitude, and the slightest renewal of the process that infused it there will undo all that science has essayed in the work of obliteration; commentators, therefore, cannot be too learned or too cautious in avoiding the onus I have mentioned.

There are classical allusions, also, which my total ignorance of Roman and Grecian letters would insuperably bar me from understanding, or judging as to their correctness. This forms an essential objection to an assumption of the critical pen, for herds of writers are to be found who deal by wholesale in Cupids, Mercuries, Venuses, &c., without comprehending their allegorical significations; and who would in consequence despoil mythology of half its poetic charms, but for the argus-vigilance of the reviewer, and his efforts to lay bare their tumid pretensions.

To multiply instances against myself, I may also remark, that being uninitiated in the rules of composition, (for, though genius is, and ought to be, unfettered as the wind, it *has* its self-imposed restrictions) I should be but ill qualified to judge of style, or to pronounce with certainty whether an author, when soaring, preserved true dignity in his flight, or, like Icarus, scorched his feathers in the sun, for what a limited judgment like mine would frequently mistake for sublimity might often prove mere rhodomontade and bombast. Finally, it is highly probable that my witless head would often condemn as dull, passages containing the very essence of wit, or enlivened by some redeeming quip which needed but a slight exercise of thought to cause it to flash forth in its native raciness. I remember being sadly puzzled at the plaudits excited by one who, being accused of sinister motives, replied that all his intentions were right: I did not perceive the dexterity of the allusion.

Oh! when I think of all these things, how I blush for

the temerity of those who venture unqualified to review a book, and tremble at the precipice on which I placed myself when meditating a similar design.

But I *must* have a subject in some shape or other: Men and manners? I mix but little in society, and know nothing of the clue to character.

Biography? I never knew a person whose life deserved recording.

Astronomy? With the works of Newton and Herschel in the field? Preposterous!

Chemistry? Absurd!

The state of the times? Those who run may read that every day.

I have it! A fictitious tour, with descriptions of scenery, &c. Pshaw! I have seldom strayed beyond the limits of Cockneyland in my life. Besides, so far from knowing any thing about the minute expressions of the physiognomy of nature, so necessary to fill up a faithful picture, I am unacquainted with even her leading features, never having made geography a study; from whence the corollary may be inferred, that the attempt would prove a humiliating failure. Some men, I know, do such things with the aid of a road-book and gazetteer; but I can't.

Another thing: suppose that I *was* tolerably acquainted with general and local scenery, but little would the knowledge avail me; for, as botany was a neglected branch of my education, I should cut a miserable appearance when it became necessary in description to decorate my landscapes with their proper indigenous trees, shrubs, and wild flowers, neither of which am I able to distinguish by name: I cannot discriminate between a beech and an elm; exotics bloom and flourish before my eyes in strict incognito; and as to the lowly campestrial brothers and sisters of the flowery world, the "daffy-down-dillies," the "shepherds'-clocks," the "devil's oatmeals," &c. &c., why I am scarcely cognizant of the familiar appellations bestowed upon them by children.

But there is yet a graver reason why I should not approach so hallowed a subject:—it demands a POET to describe this scenes of nature—one with "a poet's dip and a painter's eye!" one with an animus for the task, and a Homeric afflatus to inspire him—one only, in fine, possessing such talents as would have entitled him in the olden times to a seat in a Grecian symposium.

How immeasurably do I find myself behindhand in all these qualifications! How shallow my powers, compared to the mighty depths of intellect which ought to exist, ere such a theme be launched upon the brain! To render my case more hopeless, I have not climbed half-way up the great pyramid of *language*, much less attained its summit! How, then, in treating such a subject, could I expect to select with sufficient taste the delicate varieties and elegancies of expression so needful to touch each key-note of the soul? How clothe my imagery in those apt and happy terms which, floating equally clear of vulgarity and rant, achieve the true sublime? How presume, after the Psalmist and other men of soul, to display the poverty of my acquirements in an attempt to describe the brightest works of God; the gardens of nature in the wild luxuriance of their vegetation; the mountain torrent in its might, and the peaceful lake in its beauty; the varieties of hill, dale, wood, and water; the green attire of nature, and the countless perfumed gems with which it is adorned; the cloud-bedappled sky, its glow at sunrise, and its dissolving hues at sunset, which melt upon our hearts like the spells of an enchanter? How delineate the wizard charms which make

such views appear like pictures of a godlike thought? How, I say, can I even approach such things, and not fail?

Many, as much disqualified as myself, have the arrogance to enter boldly on this tremendous exercise of penmanship, because, forsooth, they have a knack at turning similes, through the aid of which they contrive to give a faint shadow of the substance! Even this wretched resource I am without. Whatever metaphor I have in me is as thick as treacle in December, requiring the fires of genius to make it flow; and for me to attempt the graces of a simile, would be about as absurd as the awkward endeavour of a horse-doctor to feel the pulse of a fine lady.

All things considered, then, the fair goddess of this world must beckon to some other votary to wind her labyrinth and describe her charms. Yet I *should* like to furnish the Mags. with an article. Can I say anything on the beauty and harmony of the sciences? 'Tis a pretty subject; but there are so many men who know all about it, whilst I scarcely know the sciences by name, that it would be a pity to provoke their indignation, and call down a tempest of wrath upon my head which must inevitably crush me.

Powers of imagination! what theme shall I discuss?

Dare I venture upon a political paper? Let me examine the requisites, and see.

A political essayist ought first to inform himself of the wants and wishes of mankind, and of what is good and necessary to supply those wants; by which he will at once be enabled to judge of the applicability and inapplicability of public measures. He must then possess himself of a knowledge based in the constitution of his country; its blemishes and beauties, its advantages and defects. With a sound judgment, he may then form an idea of the essential means by which the one may be sustained and the other obliterated. He must next get the statute-book almost by heart, that the working of old laws may guide his experience in the formation of new. He must also get acquainted with the laws of other countries; their effect upon our commerce; their political and mercantile connection with his own; and what would be the true adjustment of the balance of power. After this, he must annihilate, root and branch, all prejudices implanted in his mind when young, by parents, guardians, or teachers. This will prove a very difficult achievement: nevertheless, it must be accomplished. But while casting the old skin, he must take care how he adopts another; for truth is always naked, and belongs to no "party;" therefore, let him place confidence in the impregnable consistency which his new acquirements will form beneath the shell of his old opinions, and unflinchingly oppose those reptile insects, from whose teeth no core is safe, when they have once entered its case. Having thoroughly tried himself in the Allet of these ordeals, a man of mind may then plume his wings, and take an eagle's flight to the world of politics.

How, in that new sphere, will his powers be tried! Everything will wear a fresh appearance from that he has been accustomed to contemplate at a distance; hovering over an arena of strife and toil; he will be unable to distinguish friends from foes; he will witness a *mêlée* in which each claims to be right, and taxes his opponents with being wrong, and where each party is masked with professions for its country's good. On his appearance above the field, every finger will be raised to afford him a resting-place, and the action accompanied by the most seductive "nods and becks and wreathed smiles." But he must reject all advances, and, however weary, soar

above the belligerents a little longer, because the excitement of the political conflict would otherwise confuse his new-born ideas, and might induce him to decide much in the hap-hazard way a man often does, who, arriving at the scene of a pitched battle, espouses the cause of a particular combatant (from his possessing some attractive outward quality), without enquiring into his character, or the cause of quarrel.

To enquiry, still greater perplexities will succeed; but need these be described? Do we not all know the hollowness of that promising fruit which self-styled liberals hang upon their boughs, and which, by its fair-seeming, tempts us to pluck and eat, as Eve did of old, ere we reflect upon the consequences? Thus dazzled, how difficult it is for the observer to turn his longing eyes from the smiling apple to the sound substantial fruit, which feeds and invigorates, though it may offer no showy fascinations to the sight or taste. But, nerved with good intent, he will soon recover himself, and employ the lessons of his noviciate as instruments to clear his vision. Immediately all will become plain; the mask will fall from hypocrisy, and display the real features of its wearer; the graceful wave, which erst courted our student to its ranks, will become a menacing arm; and the fruit to which it pointed a mass of loathsome rottenness! This decides the question, and the looker-on takes his resting-place upon the other side.

Then approaches his greatest difficulty, namely, to keep the vigilance awake, and preserve a constant watch upon his *friends*. It is too common to give our unlimited confidence where we have once formed a good opinion, without reflecting that past actions are not to be trusted as sole security against the future violation of duty, or remembering that the most guilty man is *innocent* until the conception of his first crime. Hence we often meet with pitfalls of danger where we deemed ourselves most safe, through trusting too much to the light we have set before us as a beacon; and hence it becomes manifest that even the high-minded shepherds of the flocks must be kept to their posts, lest they allow a wolf to creep in, and triumph over their barriers of security. Still further, a "look-out" must be kept upon such beneficial measures of the adverse party, which one might be inclined, without scrutiny, to oppose, as emanating from a despised faction. In short, the polemist should be a man who could bind himself to look at principles, not individuals: to separate selfish from disinterested motives; to gaze with a calm eye and a steady head upon the whirling chaos of conflicting opinions; to follow the ramifications of actions to the fountain-springs of motives; to fathom the depths of protestations and intentions; and to cope with Machiavel himself!

For me to do all this it is supererogatory to observe would be impossible. I should scarcely understand the intent of a proposed law, and might often join some obscure village in the cry of injustice against a measure, which, having the welfare and conduct of *NATIONS* for its gigantic purpose, would naturally leave municipal and other minor details for future legislation.

At length, then, I have discovered why *genius* meets such slow encouragement in its infancy: the empiries of literature, neglecting to task themselves with a self-examination similar to that which I have just undergone, pen their crudities, in the blind hope of passing scum and dross for solid metal, and unblushingly dispatch them to the periodicals, without knowing a tittle so much as their readers upon the subjects on which they have written. Thus the time of an editor is occupied with trash, whilst an article of merit, perhaps, lies by unheeded; and his

mind being thereby naturally soured, he overlooks all papers from a strange hand, and relies upon well-known contributors; so that the herd of small fry injure the very cause which they take so much pains in public to advocate.

With this bitter conviction, I resign my pen. These few thoughts may induce some writers to be more reasonable, and less audacious; but beyond that they can claim nothing, as they plainly prove that for me to write an article for the unapproachable magazines is *IMPOSSIBLE*; and my only remaining hope is that you, Mr. *Shepherd*, as you are so clever at reconciling all that appears opposed in nature, may be enabled to point out how one like myself may succeed as a literary character—without the requisites.

TUDOR.

THE FINE ARTS.

WE are admirers of all the imitative arts, whether painting, poetry, sculpture, or the drama; nor do we conceive that the perfection of these arts consists in a close adherence to the great original standard. There are certain liberties or deviations which the refined taste and universal assent of mankind have always permitted to the imagination of the artist for the sake of effect. A view of common place nature on the canvass, with whatever accuracy of outline and colouring the picture is finished, still leaves a large hiatus of death and inanition which no art of man can possibly fill up. This defect must be remedied by the imagination of the artist, by the selection of tints, and shadows, and lights, which, partaking of the general resemblance to the great original, at the same time impress the mind with an idea of something superior to the everyday scenes of real life—happy combinations, which are possible in nature, but so rare and so exquisitely superior to ordinary phenomena as to assume the appearance of nature in a new dress.

A sculptor generally uses very great liberties with nature; his sitting figures are frequently one half longer than the natural proportion demands. The painter is obliged, for the sake of giving grace to his attitudes, to make similar deviations from the natural standard. Michael Angelo's stooping figures are monsters in length; if raised upright they would look like men of common dimensions as to head and chest, and bodily rotundity, but eight or nine, or even ten feet in height. This is a piece of deception practised upon the eye, which general eyeses upright objects taller, and horizontal objects shorter than they really are. Let any one try to draw a square or a circle without the use of measurements, and he will find that what he thinks a square, looking in one direction, appears a parallelogram when turned at right angles, and the circle appears an oval. This, however, is not the only reason why this license is used in painting. There is additional grace and dignity communicated by the departure from strict truth, which the poetry of the art still sanctions as consistent with good taste, and indispensable for effect.

These observations apply equally well to poetry and the drama; but more especially to the drama, where the deviations from pure nature are more extravagant than in any other imitative art. In what is generally esteemed the highest department of acting, a strict adherence to nature, both in the tones and the voice and movements of the body, is the standard of excellence in the individual; but the concomitant circumstances, of numberless variety, which are introduced—some from defect of acting, others for the purpose of stage effect—are, in general, the most

outrageous liberties with Mother Nature that the soul of a caricaturist could imagine. A murder is committed on the stage in the presence of several attendants; the victim screams, and falls; the murderer brandishes his weapon in all the excitement of real passion; the two parties engaged seem to be in real earnest; and the plaudits of the audience accompany the performance. But let the eye of the spectator merely look at the lifeless, motionless limbs of the stage attendants: no look of horror, fear, surprise, or any other passion, is visible; there they stand as cool as cucumbers; and, probably, with the greatest composure, take up the body and drag it along as a butcher's boy would haul off a newly killed carcase.

This is a specimen of stage defect; but the stage effects are equally ridiculous. *Malvolio* enters with a letter, which he supposes to come from his mistress, *Olivia*; but the letter is merely a trick of *Maria*, the maid, to impose upon the conceited coxcomb. *Sir Andrew Aguecheek* and *Sir Toby Belch*, are both upon the stage when he appears. He reads the letter aloud, and comments upon it aloud. The other two, supposed to be unnoticed, overhear the whole soliloquy, and converse aloud upon the subject. They pass and repass each other; yet *Malvolio* takes no notice of his company, nor hears the sounds of their voice, which is audible even to the gods themselves. This is stage effect; nothing can be more absurd, yet it is unavoidable. The excess, however, to which such ever-dropping scenes are sometimes carried puts criticism to the blush. It is the very antithesis of Nature.

Some square and compass minds, without imagination, without poetry, without any of the life and extravagance which give efficiency to human actions, may very probably coolly observe upon these outrages upon nature, that it would be much more consistent with good taste to preserve a close adherence to real life. But in many scenes the imitation of real life would make no impression. In the scene of the murder alluded to, as the defect arose from imperfect acting, a closer imitation would consequently be an improvement; but were a soliloquy to be acted as original nature generally if not always performs it, it would reduce the task of the actor to mere dumb show. Nature must occasionally be outraged, but no rules can point out to genius how and when the outrage ought to be committed. Tragedy and comedy correspond to historical and caricature painting. In good caricature the extravagance is not more in degree than in historical painting itself, and the same accuracy of drawing and richness of fancy is necessary for both. Excess of any kind is always a symptom of defect of genius. But historical painting, like tragedy, addresses itself to the gravity, the reverence, and the solemnity of human nature, whilst comedy and caricature attempt the more humble and cheerful task of exciting mirth and good humour. Hence it has been a long and universally established rule to write tragedy in blank heroic verse, whilst comedy must rest content with plain prose.

STATURE OF THE HUMAN RACE.

CONTRARY to what occurs among domestic animals, variations of stature in the human race are included in much narrower limits than individual variations. The size of women is less variable than that of men. They are much smaller than men among people of large stature, while the difference in size between the sexes is very small among people of low stature. The people who are most remarkable for their great height, generally inhabit the southern part of the American continent, others in various archipelagos of the Southern ocean; and it may even be remarked that they thus form in the Southern hemisphere

two series, one continental, the other insular, both irregular and often interrupted, but commencing in each at eight or ten degrees of South latitude, and terminating at about fifty degrees. There exist, however, in the Southern hemisphere, people whose height is below the mean, and reciprocally in the Northern, those whose height surpasses the mean. Now, in comparing the geographical position of these people with those who are extremely tall or extremely short, we arrive at the result apparently paradoxical, and yet in part of easy explanation, that the short race live almost every where near the tallest nations, and reciprocally, the tallest people near those nations who are the most remarkable for their low stature. The diversity of stature in the human race may be explained (but in part only) by the influence of climate, of dietetic regimen and mode of life. It is at least extremely probable that the size of the race, notwithstanding some local variations, has not sensibly diminished; and this, not only from the concurrence of so many kinds of proofs as are derivable from historical evidence from the earliest known periods, but from considerations of science, in the absence of all monuments, it may be inferred that there has been no material change since the origin of mankind.—*Revue Encyclopedique*.

A STORY OF A FLEA.

BEFORE I skip back to the point from which my own flea and the Poitiers' flea have led me, I must tell a story of an English lady, who, under a similar circumstance, was not so fortunate as Pasquier's accomplished friend. This lady, who lived in the country, and was about to have a large dinner party, was ambitious of making as great a display as her husband's establishment, a tolerably large one, could furnish; so that there might seem to be no lack of servants, a great lad who had been employed only in farm work was trimmed and dressed for the occasion, and ordered to take his stand behind his mistress's chair, with strict injunctions not to stir from the place, nor do anything unless she directed him; the lady, well knowing that, although no footman could make a better appearance as a piece of still life, some awkwardness would be inevitable, if he were put in motion. Accordingly, Thomas having thus been duly drilled, and repeatedly enjoined, took his post at the head of the table behind his mistress, and for a while he found sufficient amusement in looking at a grand set-out, and staring at the guests * * This lady was in the height, or lowness of fashion; and between her shoulder-blades, in the hollow of the back, not far from the confines where nakedness and clothing met, Thomas espied what Pasquier had seen upon the neck of Mademoiselle des Roches. The guests were too much engaged with the business and the courtesies of the table to see what must have been worth seeing, the transfiguration produced in Thomas's countenance by delight, when he saw so fine an opportunity of showing himself attentive, and making himself useful. The lady was too much occupied with her company to feel the flea; but to her horror she felt the great finger and thumb of Thomas upon her back, and to her greater horror heard him exclaim in exultation, to the still greater amusement of the party—"a flea, a flea! my lady, ecod I've caught 'en!"

Answers to Correspondents next week.

ERRATUM.—In our last number, first column, for "leisure, enthusiasm, and want of opportunities," read "want of leisure, enthusiasm, and opportunities."

[Price 1d.]

SYSTEM OF NATURE.

LAST week we compared the doctrine of Universalism to the concourse of a large capital which receives into its spacious walls the inhabitants of every clime, and the adherents of every faith; whose inhabitants see more of human life, or what is called the world, than the inhabitants of provinces, who can tell only by imagination, or by description, what a foreigner is. The inhabitants of such a capital are more liberal than all other citizens and townsmen, in proportion to the variety of circumstances and opinions by which they are surrounded, or the opportunities they have of becoming acquainted with it. In former ages these opportunities were social and personal intercourse alone, and there were no other means of correspondence invented; consequently they must have been limited to a very small proportion of the people, especially those who associated with foreigners, as merchants or courtiers. But the printing press has now spiritualized the capital, by furnishing the inhabitants of the villages with better opportunities of information respecting the rest of the world than could ever have been enjoyed at a former period, by the first courtiers or merchants in the country. The opportunities are open to all, but the advantage must always reside with the greatest number and the greatest power.

The necessity of keeping up this centralizing system of a capital, and a large capital too, must be obvious to every one who takes the subject into serious consideration. To squander the population of London and Paris, and distribute the inhabitants of other large cities throughout the provinces of the empires, would have the same effect upon society as a blow on the head upon the mind of a man. It would terminate in an instant the social intercourse of Europe; it would remove the Continent from Britain many thousands of miles in effect, for it would destroy the interest of individual places, which now represent the empire in themselves. Amongst ten thousand villages or hamlets of England, which of all the number would take the lead? which would represent the whole in itself, and attract to itself as a centre, the attention of the rest? Not one. The residence of the government, as may be demonstrated in the case of Washington, in America, is but an inferior circumstance to the majority of population. New York is still the capital of America, the seat of science, of art, and the source of all general and interesting information. Is Lancaster to be entitled to the same respect as Manchester or Liverpool? Is Lanark, a paltry village, to be weighed in the same balance with Glasgow? Washington, Lancaster, and

Lanark, are unknown in the history of science or of art, and nothing can ennoble them but magnitude or thoroughfare alone.

What may be at some future period, when wars have ceased, and political and religious dissensions have commingled, is hard to determine; but it seems perfectly evident to our understanding, that unless there be a time when progress in the arts and sciences shall terminate, and man shall sit down in sluggishness, and say, "I have accomplished all of which my nature is capable; I can discover nothing new, I can invent nothing new, I can learn no more," there never can be a time when large cities shall cease to grow, and that to a greater extent than history has recorded or mankind ever yet beheld. They are the representatives of nations, the same on the great stage of the world as our members of parliament in the house of legislation,—"the voice of the people."

Moreover, it is necessary for the general amelioration of any one individual country, that other leading or powerful countries should all accord with it in pursuing the same *universal* system of politics. For one country to hasten rapidly before the rest in the march of progress would be certain misery and perhaps destruction to herself. It is so with the individual man. There is no additional happiness acquired by outmarching public opinion. He who increaseth knowledge only increaseth sorrow to himself, if that knowledge is in discord with the public opinion which surrounds him. He loses his good name. He is called mad, blasphemer, infidel, or any other title expressive of abhorrence. He is pointed out to the children by their parents as an example to be shunned; every word, every action, is misconstrued in its meaning, and even his good deeds are ascribed to diabolical motives. It is a very dangerous thing, and requires much prudence and moral courage, to transgress against the spirit of the society which surrounds us. Many, destitute of these qualities, and allured by the delusive paintings of enthusiastic hope and immatured opinions, have foolishly done violence to the spirit of society, treated every thing venerated by other men with outrageous contempt, suffered corresponding degradation in their good opinion, lost their influence, their respectability, their friends, and ultimately sunk into the very sediment of society beyond all hope of recovery.

The same law prevails upon a large scale with the intercourse of nations. They are all dependent upon each other, as reciprocal traders; and there are certain mutual arrangements to which all subscribe, for the

regulation of international commerce and friendship. These arrangements are at present in a most barbarous state, the remnants of those ancient jealousies, rivalries, and hatreds, which spread fire and sword over the fairest provinces of the world. Were one individual nation to cast off this barbarous policy, to open wide its ports unto all strangers, and grant no protective privilege to its own subjects, whilst foreign nations refused to employ the same liberal line of policy in return, the consequence would be, that the liberal system would destroy the nation which had so hastily adopted it, and the rest would pursue their restrictive measures with greater spirit than before.

It is this important fact which renders foreign intervention an important subject of political economy. It may seem a matter of indifference to many, whether Spain and Portugal, Russia and Austria, be liberal or despotic in their political system. "What have we to do with Spaniards and Portuguese, and Northern Barbarians?" they may exclaim. "Let us leave those nations to settle their own affairs, whilst we confine our attention to domestic matters." This is not good policy. It may not immediately concern us, and there may be more important matters at home which ought to have the precedence; yet, it is a fact which a universal eye must perceive at once, that no individual nation can be generally relieved of political grievances, until some universal system of liberal policy be infused into the government of all the leading nations of Europe. The popular spirit of France alone created a moral revolution in England. What would have been the momentum of that impulse if it had been augmented by a similar outcry from Spain and Portugal, Prussia and Austria? It is the interest of the people of England to cultivate the same spirit in the rest of Europe that now prevails in France, for therein is their strength. The Tories know this well, and therefore they give secret assistance to the absolutists of other kingdoms, that they may replant the stock of despotism, and smother in its cradle the young Hercules of popular sovereignty.

We ought to entertain or affect contempt for no species of power, political, moral, or opinionative, which holds dominion over the human mind. Whatever it is, it has its use in the great economy of Nature; but as it is impossible for any individual to bestow a minute attention upon every subject, or be more than a very superficial universalist at best, it is the duty of every man to bestow his attention particularly upon some minor department of thought or of labour to help on the general movement. Nor will it be difficult for him to determine to what particular party in society he ought to give his patronage and assistance, even though convinced that each party has some goodly principle within it which ought to be preserved and cultivated. For as Progress is the watchword of the Universalist, and the spirit by which he is actuated, his heart can never fail to sympathize most intensely with those who keep up the movement of society in the reformation of abuses, and the amelioration of the whole system of legislation and government, faith and opinion. That movement necessarily changes as it progresses, and cannot fail to become more and more univer-

sal in its views as it draws within its circle a greater amount of the heterogeneous mass of mind which society contains. If the movement appears too rash, and in need of a check to prevent a fatal catastrophe to its career, his own judgment will direct him to stand forth as the advocate of the stagnant or retrogressive principle.

But the part which each man takes in society in respect to the adoption of political principles greatly depends upon the accidents of birth and condition in life. There are many aristocratic families in this country who transmit their political opinions from father to son, as they do their estates, with the same security of their being retained. And if a poor man is not born a radical, both by the father and mother's side, his poverty is sure to make a convert of him before his manhood has reached its prime. With such men reason is of very little use: they are led by impulse. They will always prefer an address to the passions to one which is addressed to the judgment. The everlasting subjects of the wisdom of our brutal ancestors; the beauty of the British Constitution; the sanctity of the Church; the danger of innovations; the glory of British arms, if well illustrated, and prettily expressed, never fail to make a powerful impression on the old aristocracy of England. They want no new subject, no new arguments; it is the wisdom of their ancestors alone that they desire; they have no objection to hear it expressed in modern language, with poetical illustrations and elegant quotations; but the doctrine itself must be ancestral, or they discard it as an innovation. On the other hand, the everlasting subjects of universal suffrage, vote by ballot, the tyranny of the rich, the burden of taxation, the indolence and perversity of the clergy, are equally palatable to the radical ear. It is the very counterpart of the other; but, like the other, it wants no new information, no argumentation, but merely a flourish in the usual key of condemnation, and pompous defiance of power, brings forth shouts of applause, and adds fuel to the fire of discontentment and resistance.

The majority of a party do not *think*, they *feel*; and it is well that it is so. *Feeling* is the life of the individual and of society. Thought is merely its servant, or its prime minister. It is from the feelings, the affections, and the passions, that the impulse proceeds; there dwells the spirit of the age, and the terror of despots. Feeling, however is a blind agent; it is an impetuous headstrong colt, without experience and without judgment. A little reason is necessary to check its precipitancy, and give it a right direction. A little more would destroy its spirit, and paralyze its powers. Passion always is, and always must be, stronger than reason. Passion is the life of man, and reason is only its mentor to refine and humanize, but not to destroy or even to cool it. As there is a greater amount of passion than of reason in the individual, so there is also a corresponding greater amount of passion (or feeling) than reason in the public at large; and the few who do think and reason intensely are only of use to direct the public feeling towards a right channel.

All this is wisely ordered by Nature, and to wish it were otherwise, is to wish for greater confusion in society than has ever yet prevailed. But in teaching a new doctrine the reason must always be preferred to the feelings,

in order to present a definite object for the latter to aim at. Love cannot exist without a definite object of attraction, nor hatred, without an object of aversion.

THE SHEPHERD.

THE PRESS AND ITS CORRUPTION.

In a former number we remarked that the greatest evil attending the public press at present is, that it is a trade, and consequently mercenary. To this, in a greater or less degree, may be ascribed all its imperfections, except those which arise from pure ignorance, which ought not to be taken into the account. But there is a good and a bad side of every question. There is nothing in human society or in nature which is pure and unmixed good or evil. This foolish idea of the unadulterated quality of certain principles, circumstances, or motives, which they are pleased to call good or evil, still too much haunts the religious and political zealots. There is not even a grain of utility, truth, or common sense in those measures or doctrines which they denounce; and the characters by whom they are defended are proscribed as deliberate premeditative villains. This excess of censure, and abuse of language, belong in a peculiar manner to the two extremes of society in their estimate of each other. The poor are not more abusive and suspicious of the motives of the rich than the rich are outrageous in their abuse of the poor. The ungenerous and unfeeling manner in which the aristocracy and their press have always spoken of the "mob," and the "vulgar," cannot fail to be retorted upon themselves, as soon as the mob and the vulgar can find a vent to give publicity to their thoughts. This they have now found in the unstamped press; and if this press has frequently descended to the use of low scurrility, and most aggravated descriptions of the characters of men in power, we are convinced it has never yet approached, either in language or feeling, the contempt and scorn which the aristocracy entertain for the people, nor the unsanctified abuse of the powers of reason and of speech which has been exhibited by the stamped press in its polemical controversies; nor can any abatement of this fury ever take place as long as there is such a wide and unsocial gulf between the conditions of the two parties.

Neither party errs when it accuses the other of being mercenary. The love of money is the ruling passion; the very mainspring of society. Nor can we wish it to be degraded from its rank of superiority as long as it continues to be the medium by which all the external enjoyments of life are procured. Money is to the body what a peaceful conscience and well-instructed understanding are to the mind. It has been, and still continues to be the prime stimulus to action in all the political transactions of life. It has given birth to industry and genius; roused up indolence from its ignoble rest; spurred on the pursuits of literature, science, and art, and actually refined and beautified the human mind, which at the same time it so grossly corrupts and brutalizes.

Nor have these beneficial results been a-wanting on the press. Its mercenary character is the principal source of its greatness. No other argument or motive could have

been found sufficient to give it that extraordinary impulse by which it is now universally moved. The mere desire of communicating information could never exist sufficiently strong in the conductors of a public journal, as to induce them to sacrifice the comforts of sleep; to convert day into night, and night into day; to harass themselves with everlasting bustle, in order to be prepared for the public at their regular hour of publication; to open up sources of information in every part of the country, to send out foragers in all direction in search of occurrences, novelties, and eccentricities; to establish correspondents in the different capitals of Europe, to provide a daily supply of foreign intelligence; whilst, at home, every department of public business, from the legislative government of the nation, down to the prices of eggs and butter, seems to have an equal degree of attention and accuracy devoted to it.

What other motive can be found to induce men to do such a gigantic work as this, except the mercenary motive—the love of money? What other instrument, but a mercenary press, could be relied upon? A government press could never obtain the confidence of the people, for it would publish its own praises, and conceal its own shame; and no combination of parties can, as yet, take place, so harmoniously associated as to dictate spontaneously the same leader to a newspaper. What then we characterised as a fault and a misfortune, is really the best condition for action in which the press can be placed, and it is only a fault because society at large is in fault by being placed in the same imperfect state. There is no greater corruption in the press than there is in any other department of trade and commerce, and its own follies will work out its own reformation. No legislation can cure it; no reproach can put it to shame, or amend it; it must be guided entirely by its own experience in the operation of public opinion.

There is one peculiarity respecting the public press, which, to us, is the most interesting feature of all; and that is the paradoxical or bipolar fact that it is both gaining and losing its power rapidly. It is gaining power collectively, but each journal is losing its power individually. A few years ago, men were so sectarian in their spirit, that they adhered as bigotedly to the politics of a particular newspaper as to the creed of a particular church. They read one paper only, and formed their opinions upon it. There is a good deal of this narrowness of principle still observable amongst the people, even where the opportunities are abundant of viewing the same subject in very opposite aspects; but the spirit of universalism is increasing, and the public are now becoming daily more disposed to compare journal with journal, statement with statement, gradually losing confidence in the veracity or the judgment of an individual opinionist. This is political infidelity, and it destroys political bigotry and old faith, and leads ultimately to a new and yet unknown doctrine, namely, political universalism, which results from the concentration of all political opinions into one, preserving alive and in active operation the peculiar characteristic and declared principles of each.

INITIATION OF BOYS.

Extract from "An Account of the History, Manners, and Customs of the Indian Nations who once inhabited Pennsylvania and the Neighbouring States. By the Rev. John Heckewelder, of Bethlehem. Published in the Transactions of the Historical and Literary Committee of the American Philosophical Society, Vol. I. Philadelphia, 1819."*

"I do not know how to give a better name to a superstitious practice which is very common among the Indians, and, indeed, is universal among those nations that I have become acquainted with. By certain methods, which I shall presently describe, they put the mind of a boy in a state of perturbation, so as to excite dreams and visions, by means of which they pretend that the boy receives instructions from certain spirits or unknown agents as to his conduct in life; that he is informed of his future destination, and of the wonders he is to perform in his future career through the world.

"When a boy is to be thus initiated, he is put under an alternate course of physic and fasting, either taking no food whatever, or swallowing the most powerful and nauseous medicines; and occasionally he is made to drink decoctions of an intoxicating nature, until his mind becomes sufficiently bewildered, so that he sees, or fancies that he sees, visions, and has extraordinary dreams, for which, of course he has been prepared before hand. He will fancy himself flying through the air, walking underground, stepping from one ridge or hill to the other across the valley beneath, fighting and conquering giants and monsters, and defeating whole hosts by his single arm. Then he has interviews with the Manitto, or with spirits, who inform him of what he was before he was born, and what he will be after his death. His fate in this life is laid entirely open before him; the spirit tells him what is to be his future employment; whether he will be a valiant warrior, a mighty hunter, a doctor, a conjuror, or a prophet. There are even those who learn, or pretend to learn, in this way, the time and manner of their death.

"The belief in the truth of these visions is universal among the Indians." * * *

"I always found it in vain to attempt to undeceive them on this subject." * * *

"I once took great pains to dissuade from these notions a very sensible Indian, much esteemed by all who knew him, even among the whites. All I was able to say or urge was not able to convince him, that at the time of his initiation (as I call it) his mind was in a state of temporary derangement. He declared that he had a clear recollection of the dreams and visions that had occurred to him at the time, and was sure that they came from the agency of celestial spirits. He asserted very strange things of his own supernatural knowledge, which he had obtained, not only at the time of his initiation, but at other times, even before he was born. He said he knew he had lived through two generations; that he had died twice, and was born a third time, to live out the then present

race, after which he was to die, and never more come to this country again. He well remembered what the women had predicted while he was yet in his mother's womb; some had foretold that he would be a boy, and others a girl; he had distinctly overheard their discourses, and could repeat correctly every thing that they had said. It would be too long to relate all the wild stories of the same kind which this otherwise intelligent Indian said of himself, with a tone and manner which indicated the most intimate conviction, and left no doubt in my mind that he did not mean to deceive others, but was himself deceived.

"I have known several other Indians who firmly believed that they knew, by means of these visions, what was to become of them when they should die; how their souls were to retire from their bodies, and take their abodes in those of infants yet unborn; in short, there is nothing so wild and so extraordinary that they will not imagine, and to which, when once it has taken hold of their imagination, they will not give full credit."

[These facts show at once that the telluric life, or the magnetic evocation of the Spirit is spread every where. The methods by which Pythagoras in Samos, the Egyptians in Memphis, the Druids in the North, and the Americans, have endeavoured to call forth the spark of true life, are the same. Magnetism is Universalism.—A.P.]

DUELLING.

THIS is one of the most barbarous of existing customs. There is no epithet too vile and contemptible to characterize it. It belongs, in an especial manner, to the gentry, and the lowest of the people. The middle classes are too refined in their feelings to settle their quarrels in so brutal a manner. All the difference between a duel between two gentlemen and two nightmen or scavengers, is that the former fight with fire-arms, and the latter with the bare fists. The former do it in secrecy, with merely a second to accompany them; the latter in public, with a crowd of men and boys as spectators. But, if one party exceeds the other in publicity, the other makes ample amends in its murderous intentions. An insult amongst the mob, as they are contemptuously called, is satisfactorily atoned for by a good sound beating; but nothing but the life of the aggressor will give satisfaction to a gentleman. A few days ago, we saw two great lubberly fellows quarrel, and refer their disputation to the usual criterion of martial skill; they undressed upon the spot, and, all stripped except of the trowsers alone, which were not even upheld by the usual apparatus of braces, they shut their eyes, and bent their heads like two bulls preparing for onset, and each dealt the other some resounding blows, levelled at a venture, without any pretensions to skill, till at last they embraced, like two infuriated lobsters, and tumbled upon the ground, amid a huge collection of small pebbles, so that the flesh was torn from their shoulder-bones, and their backs and breasts were streaming with blood and clotted with gore. One of the two then sounded a truce, and the other, being satisfied with his rival's resignation, withdrew, amidst the plaudits of his party. The wounds of these two fellows would heal

* The Author resided among them forty years as a missionary.

in a few weeks; had they been gentlemen, one most probably would have been sent to Erebus, to make way for the offended pride of a popinjay, whose moral and intellectual worth are insufficient of themselves to wash out an insult.

Is there none, amongst all our men of reputation, who have sufficient moral courage to confess themselves cowards, and boldly refuse to employ this brutish system of judicial trial? It requires little more than one or two eminent examples to put a termination to the practice for ever. Why should a man be ashamed to confess himself a coward? Is there no gentleman so *courageous* as *boldly* to declare himself such before the astonished world? There are two ways of making an acknowledgment of cowardice: the one is frank and generous; the other is hypocritical and false. The dastardly coward pretends to be brave, whilst he is quaking with fear; he is loud and pompous in his speech, like Pistol, and has as large a volume of his own exploits to repeat as Sir John Falstaff himself. He is never known to quake, or to run, except when he is brought "to the scratch," and then he runs, not so much because he is afraid of his own person, but his tender feelings cannot bear the idea of wounding his adversary. The honourable coward is a man of much finer metal. He candidly confesses that he does not like to be shot at; that he wants to preserve his life as long as he can, and to keep his limbs in a state of health and vigour, that life may prove a blessing instead of a curse; he thinks it most extravagant folly to run the risk of being maimed for life, merely to gratify a whim, or punish a slanderous and abusive rival. If the offence is committed by the tongue, he thinks it more becoming to repay it in kind; if by scorn, contempt, or any other moral injury, he has it in his power to brandish the same weapons. The greater proportion of mankind, after all, act upon this latter principle, and it seems to be quite sufficient to preserve the respectability of a man's character, in almost any conceivable circumstances of civilized life. Nor are those "blustering blellums," who seem to carry gunpowder in their pockets, and challenges cut and dry for every possible species of offence, treated more respectfully by the public or their associates, than females are by their rivals and opponents, whose tongues alone enact the very incongruous characters of rapier, bullet, and shield, at one and the same time. Man, as he progresses in moral refinement, is only woman's ape.

But why should a duel between two gentlemen be accounted respectable and honourable, whilst a duel between two irritated labourers or mechanics is designated a brutal and disgusting scene, and gives such an unfavourable impression of the contending parties, that any lady or gentleman, in England, would, upon hearing of such an affray between two men in their employment, dismiss them immediately. His Majesty would not dismiss a minister or a councillor, even if he were to kill his man upon the spot. The reason is, that judgment is always favourable to gentlemen. It is the disobedience of gentlemen which brings laws into inaction. The laws are much better than their administration, as Judge Blackstone very justly remarks. But the highest and

most *respectable* and *honourable* influence in the country is daily in operation, to destroy the force of many excellent statutes, whose strict administration might very speedily bring deliverance to the poor. If a personal and bloody affray between two labourers be brutal and disgusting, we take it for granted that the quarrels of gentlemen are equally so. The feelings in both parties are the same, and the object the same, namely, the preservation of their own independence; and the mode of settlement merely proves that, notwithstanding all the boasted superiority of a gentleman, he holds the same moral station in creation as an illiterate clodpole. Success to the spirit of women!

A UNIVERSAL LANGUAGE.

THOUGH a universal language may be an impracticable scheme, when founded upon abstract principles, and altogether fictitious in its construction, yet there is some probability that one language may become universal, as the learned medium by which the thinkers of all nations may obtain possession of every new discovery, and transfer them into their own tongues. The number of languages is greater in a given space, in proportion as the condition of society approaches the savage state, and diminishes as mankind advance in civilization. Each tribe of savages form a jargon for themselves; the poorer the language the more easily it is altered, the more readily its character is effaced, and its original materials concealed under new additions; but as communities increase with civilization, so languages extend with communities; and as conquest gives them extent, so writing gives them permanence and fixity. Religion has added to that permanence, by conferring upon sacred writings a perpetuity of interest, and making them, in some degree, the standard of all classes, of all conditions, and of all ages. This permanence and extent of language is consolidated by an established literature, and an established dominion; and the diversity of dialect disappears with the facility of communication, and a community of interests and intercourse.

But empire is ever proceeding on a larger scale; the community of nations embraces a wider circle; and a few languages, favoured by conquest, commerce, and religion, are spreading themselves over the greatest portion of the earth, so that the chances are increased that one of them should serve as the medium of communication with all the rest, and act as the interpreter between all the nations of the world. It may be seen, from the extent to which even a dead language is understood, and how far it has served as a vehicle of thought, what influence, and what facilities, a living language might possess, if otherwise equally favoured by circumstances, in diffusing truth, and in opening an intercourse throughout the family of man. A dead language has two great disadvantages; it has lost the principle of growth and increase; the thoughts expressed in it are but the echoes of former thoughts, conceived at a distant period of time; but the world goes on, its affairs change their face, and whatever is stationary must end in being retrograde. Again, a dead language has not the same easiness of being acquired that a living one possesses, which can be caught in every tone and accent from the lips of a speaker, and be understood by the accompanying comment of every look, gesture, and present circumstance. The customs with which a dead language is interwoven are obsolete, and it refers to a different period of sentiments, and to another age of the mind; while a living

language, if it be the language of a commercial people, may have those who speak it as their native tongue in every part of the globe; it may enter into the daily business of life; its institutions, which have given it its cast and character, may be the models which all study and wish to imitate; and it may contain in its literature whatever affects the higher interests of humanity—rich in its own native stores, and yet multifarious in its foreign acquisitions, which it has collected from every part and region under heaven. The English language possesses many of these advantages, and, from the situation of England, it might easily acquire the rest. By its colonies it might cover one-fifth of the globe, and by its commerce it spreads over the whole; its inhabitants are dispersed by the variety of their pursuits, and its institutions excite and deserve the regard of all other nations.

A language, to become universal requires to be a living language: the continual movement and progress of society, as was before observed, places a wide difference, in the course of years, between the nations of antiquity and of later times: manners change, thoughts move in a different circle, governments depend upon other principles, and the frame-work of society has been taken down and remodelled; the dead languages cannot serve as the receptacles and vehicles of new information, and they remain fixed and limited, with the acquirements of men of other days, who are gradually diminishing in their influence, as we recede from them, in the lapse of generations and centuries. It is thus that the Latin language has been decreasing in importance by modern discoveries, and becomes less and less the medium of scientific intercourse, or useful information. The Arabic language, which spread with the conquest of the Arabs over so wide and extensive a territory, to the rising and setting of the sun, fell from its high supremacy with the fall of the Caliphs, and declines with the decline of the Mahomedan religion; conveying no new information, and not spoken in its ancient purity, but become in some measure a dead language, though one of the most diffused, it offers no competition with other languages, which are rising in their fortunes and extending their influence. The Chinese language, if considered as a written and not a spoken language, embraces a still larger population, and is certainly not upon the decline, but rather increasing, as the Chinese empire spreads its authority more widely over the middle regions of Asia, and as Chinese colonies are scattered more extensively over the islands of the southern ocean; but then it is a language adapted only to a rude period, complicated and unwieldy in the structure of its symbols, and in truth not properly one language, but the connexion of a number of barbarous and cognate dialects, extremely imperfect when spoken, and only united and having their deficiencies supplied by all of them being expressed in the same complicated system of written characters.

It is apparent, that when the imperfect knowledge of the Chinese yields to the science of Europe, the language in which it is conveyed will receive a shock and must be greatly modified, to be suitable to higher advances, and a greater variety of information. Thus the two most extensive languages in Asia, which can be considered as living tongues—for the Sanscrit, notwithstanding its relation to the dialects spoken in India, and its cultivation by the Bramins, must be considered as having long been a dead language—are linked to a rude period of civilization, and are likely to be curtailed rather than advanced, in their sphere of influence, by the introduction of European improvements, and by a new era of progressive knowledge in Asia. The European languages alone, as

connected with the progress of European genius and discovery, and the universal diffusion of modern science, have a prospect of being universally diffused, and it only remains to examine which of these languages possesses the greatest advantages, for being the medium by which knowledge can be most rapidly and easily conveyed, which may be the universal receptacle of past information, and the speediest vehicle of new discovery. The French language, at one time, had the most brilliant hopes of being spoken as the international tongue of Europe. But, as Montaigne observed, its perpetuity, and its success, depended upon two circumstances—the celebrity of its writers, and the fortunes of its arms. It is singular that while France, fruitful in literature, was possessed of two springs of originality—the romances of the north, and the songs of the south, each rising at the same time, each different, and each alike original, a profuseness of novelty which no other nation can boast of, yet that both these sources should fail, or rather be entirely neglected, and that a new literature should be formed upon the imitation of the classic models. While the classic writers obtained an exclusive admiration, the French writers, as those who most strictly adhered to the classic rules of art, obtained a full share of that admiration; but now that original genius and nationality are sought in every literature, the French writers have proportionally declined; and, as the arms of France have not only been unsuccessful, but other powers are rising up into new strength, the French have both absolutely and relatively declined in importance. Their literature, and their predominance, being both on the wane, their language must gradually follow the fortunes of the powers which influenced its destiny, and will never surpass, and must gradually recede from the limits which it formerly reached. The German literature has sprung up since, and has gradually been dislodging the French from the north of Europe, being the very reverse of modern French literature, both in its excellencies and defects—full of originality, but formed upon no system, and scarcely even a plan, unless the caprice of each writer, or his shadowy theory, may be dignified with the name of a system; and while the French language abounds in master-pieces, formed exactly according to the rules of perfect art, and which want nothing but life and movement, the German literature abounds in fragments and essays, each with a peculiar flavour of the soil, but which seem to have wanted a warmer sun to have ripened them to maturity.

Again, the Germans have not that predominance in politics, or that established or unquestioned reputation in literature, nor has their country that favourable position which could give weight and extent to their language over the world at large. Their influence is confined to the north of Europe. But it vanishes in the other divisions of the globe; and even in the north of Europe, the growth of the empire and literature of Russia, though at first favourable to Germany, will gradually operate to its disadvantage, and may even overwhelm its rising energies by the pressure of its immediate neighbourhood. If width of empire alone could confer a greater extent upon language, the Russian tongue might become the most general medium of intercourse, and undoubtedly it will be prevalent far and wide, both in Europe and Asia; but the ground it must gain is so great, before it can reach the level of present improvement, and the condition of present society so unpropitious, and its want of many advantages which other tongues possess so great a counterpoise, that even it has not much chance of becoming the language most gene-

rally diffused, or of spreading far beyond the range of the Russian cannon. The Spanish language, coupled with the Portuguese, which may be considered as a sister dialect, has great advantages in its favour. The influence of either may not be great in their parent seats, in Europe, but, connected as they are with Asia and Africa, and spread over the richest parts of the new world, they are daily growing in importance, and have largely the promise of the future. Nearly allied to the Latin, from which they are descended, and to which they have ready access for new riches, and connected through it with the other languages spoken in the south of Europe, they have advantages for improvement, and for growth, and for facility of being understood, not possessed by the Russian. Their history, and their early poetry, is the most romantic, and connected with those noble and unexpected achievements which opened new worlds to the conquerors of the Moors. The sun never sets upon their territories, or those of their descendants. The countries they have colonized present every advantage for an unlimited prosperity. By the continual growth of their territorial greatness, their language must become the native tongue of the greater part of America; it will be spoken on many parts of the African continent, it has left traces of itself in India, and will spread over the islands from Manilla. It has thus a very great foundation for future prevalence, though there are several circumstances connected with it in which another language has greatly the advantage over it. The Spanish and Portuguese are sufficiently dissimilar to prevent what may be considered the Peninsular language from becoming the medium of easy intercourse between these nations themselves or their descendants. The Spanish language, which is the most diffused, is, moreover, divided against itself, not only at home, where the Castilian has never completely supplanted the Provençal in the kingdom of Arragon, but also abroad, where it has become mixed with the native languages of the country, owing to the numbers of the native Indians who remained in Peru, and elsewhere, after the conquest of the Spanish in America; and though it is probable that the Spanish will throw off, in a great measure, these admixtures, yet the process of purifying from foreign additions may delay the establishment of Spanish literature, and the advancement of the language in various parts of the new world. Again, the Spaniards, being so greatly in the rear of the other European States, is also a great drawback to their language taking the lead. Their literature has yet to be formed; they must be learners before they can be teachers; and it is more likely at present that they should have recourse to another literature and language for instruction, than that their own should be generally studied.

The English language alone remains to be considered, and it possesses more advantages than any other for becoming the great and scientific language of the world. Englishmen, and the descendants of Englishmen, will become the most diffused of any branch of the family of man, scarcely excepting the Jews. It is not merely one quarter of the world in which they are spreading themselves; they are colonizing, at one and the same moment, America, Asia, and Africa, while in Europe their population augments with a rapidity that renders emigration every year more desirable, and to greater numbers. Every class, and every profession is overstocked; and, from the facility of education, and the openings, which are presented to every rank of society, to press into the one above it; in information and enterprise, they are more and more decidedly taking the lead among the European nations. From narrowness of territory, they are

propelled with greater force to foreign adventures, and from their superiority in the arts, they are received with greater readiness by foreign states; and their capital, which increases more rapidly than any field of exertion which can be opened to it, drives their commerce, and their commercial agents, to force new entrances, to form new establishments, and to spread themselves as widely and remotely as possible. The sea is already covered with their ships; the land must in time be covered with their counting-houses, and English mechanics, artists, and professional men, will find their way in the train of the merchants, and escape from a country teeming with candidates for every situation. The power and the resources of Britain, pent up at home, will spread themselves as wide as the winds and waves can carry them, and will cause the branches of English population and literature to spread over every soil. Every country will be prepared for the reception of the English as the standard of literature, and the medium by which it may be transmitted or promoted, when they feel the superiority of the English brought home to them in all the productions of life, and in the value which their industry confers upon every species of manufacture; but above all, England has shot ahead of all other nations, and is more rapidly carried along by the current of events and the influence of the times, and has anticipated those changes, and ameliorations, of which other nations begin to feel the necessity, and those improvements in which they all acknowledge her to be their precursor and model; this priority of progress, and the belonging, as it were, to a more advanced age, will contribute to the eagerness with which all nations will be brought to the study of English, as the key to modern discoveries, and the storehouse of those truths which are beneficial to mankind.

The federal republic, though its portion of the American Continent is not to be compared with that which is possessed by the peninsular nations, and is even inferior, in several respects, to the acquisitions of the Portuguese, taken singly, yet seems destined to exert the greatest influence over the rest, from its population being more European, with an access to all the riches of English literature, and with a possession of institutions highly adapted to the situation of the new world, accordant to spirit of the times, and approved by the dictates of philosophy. It is upon these institutions that the other governments of America will model themselves, and it is in the career of the United States, in its liberality and illumination, that they will be anxious to follow. The United States have anticipated the rest in the advancement, not only of their political institutions, but of their political strength, and the distance they have gained they are not likely, in any measure, to lose, but rather to increase. The English literature is their own; without exertion on their part they are possessed of information the most advanced, and in its best form; and of all the new nations they will be the soonest enabled to enter themselves upon new discoveries, to join their own genius to that of their kindred beyond the Atlantic, and to increase the influence of that language which is common to them both.—*Advancement of Society in Knowledge and Religion, by James Douglas.*

ON THE LUMINOSITY OF THE SEA.

(From the German of Baron de Humboldt.)

In the immense waters of the deep animal life is very profusely distributed, and particularly gelatinous worms are so numerous, as to bestar the surface of the ocean, and transform it into a sea of flames,—a spectacle which

stamped upon my memory an ineffaceable impression, and always excited fresh astonishment, although it was renewed every night for months together. It may be seen in every zone; but those who have not witnessed it within the tropics, and above all upon the main ocean, can form but a very imperfect conception of the grandeur of the phenomenon; particularly if the spectator places himself in the shrouds of a ship of the line, during a fresh breeze, when she ploughs through the crests of the waves, and at every roll her side is raised out of the water, enveloped in ruddy flames, which stream like lightning from the keel, and flash towards the surface of the sea. At other times, the dolphins, while sporting in the waters, trace out sparkling furrows in the midst of the waves.

Le Gentile and the elder Forster explained the phenomena of these flames by the electric friction of the waves against the hull of the ship, as it advances. But, according to our present knowledge of physical causes, this explanation is inadmissible.

There are few points of natural history which have been so long and so much disputed as the illumination of the sea water. All that is known with any certainty may be reduced to the following facts: there are several shining mollusca, which, during their life, emit at pleasure a phosphoric light, which is rather pale, and generally of a bluish colour; this is observed in the *Nereis noctiluca*, the *Medusa pelagica*, var B., and the *Monophora noctiluca*, which M. Bory St. Vincent has recently discovered during the expedition of Captain Baudin. The microscopic animals which Forster saw swimming in innumerable multitudes on the sea, near the Cape of Good Hope, are of this number, and still undefined. The luminosity of the sea is sometimes occasioned by these living lights; I say sometimes, as more frequently, although the animals increase in size, none can be perceived in the luminous water; yet, whenever the waves strike against a hard substance and disperse in foam, particularly where the sea is greatly agitated, we perceive a gleam of light similar to lightning. The source of this phenomenon is probably the decomposed fibres of the dead mollusca, which abound in the depths of the sea; when this luminous water is strained through cloth of a close texture, these fibres are sometimes separated in the form of luminous dots. When we bathed at night in the Gulf of Cariaco, near Cumana, some parts of our bodies remained luminous after coming out of the water, the luminous fibres attaching themselves to the skin. From the immense quantity of mollusca dispersed in all the seas of the torrid zone, it is not astonishing that the sea should emit light, although we cannot extract from it organic matter. The infinite division of the dead bodies of *Dagysæ* and *Medusæ*, may lead us to consider the entire sea as a gelatinous fluid, which consequently is luminous, has a nauseous taste, is unfit to be drunk by man, but is nourishing to many fish.

If a board be rubbed with a part of the *Medusa* hyso-cella, the part rubbed becomes again luminous whenever a dry finger is passed over it. During my voyage from the south to America, I sometimes placed a *medusa* on a pewter plate. If I struck the plate with other metal, the least vibration of the pewter was sufficient to make the animal shine. Now, I may ask, how did the shock and vibration act in this case? Did they immediately raise the temperature? Did they discover new surfaces? Or, did the shock elicit the phosphoric hydrogen gas, which, coming in contact with the oxygen of the atmosphere, or of the sea water, cause this appearance? The effect of a shock which excites a light is most astonishing in a troubled sea, when the waves dash against each other

in all directions. Between the tropics, I have seen the sea luminous in all temperatures; but it was more so on the approach of a tempest, or when the sky was lowering, stormy, or obscured. Cold and heat seem to have little influence on this phenomenon; for, on the sand-banks of Newfoundland, the phosphorescence is often very strong in the most rigorous period of winter. Sometimes, all circumstances being apparently equal, the phosphorescence is considerable during one night, and scarcely visible the night following. Does the atmosphere favour the escape of light, or this combustion of phosphoric hydrogen? or do these differences depend on chance, which conducts the navigator into a sea more or less filled with the gelatine of mollusca? Perhaps these shining animalcules come to the surface of the sea only when the atmosphere is in a certain state. M. Bory St. Vincent asks, with apparent reason, why our swampy fresh waters, filled with *polypi*, are not luminous? It would seem that a peculiar mixture of organic particles is necessary to favour the production of light; the wood of the willow is more frequently phosphorescent than that of the oak. In England they have succeeded in rendering salted water luminous, by throwing into it the brine of herrings. On most other points, galvanic experiments prove, that the luminous state of living animals depends on the irritation of the nerves. I have seen a dying fire-fly (*Elatér noctilucus*) emit a strong light when I touched its anterior extremities with pewter or silver.—*Field Naturalist's Magazine*.

TO CORRESPONDENTS.

In answer to "T. T." we observe that, although Nature from time to time does bring forward extraordinary powers, which seem mysterious and incredible to all but those who are actually possessed of them; yet, after all, there seems to be nothing [new in *kind*, but only in degree. Even the devils of the New Testament are not unknown in the present day. We know one remarkable instance of a woman, who is everlastingly troubled with the loud sound of a voice which urges her to commit murder and suicide. She has even perceived the figure itself, and it haunts her continually. It is very distressing, and no doubt is connected with some mental disorder; but whether the cause or the effect we cannot say. It matters not which; there is nothing more real whilst it lasts. Life itself may be called a mental disease. Both good and evil are produced by these visitations, as by the different affections of the mind. But the evil gradually diminishes as progress advances. The evils of witchcraft were greater in former times than they will ever be again.

We have received a very pretty letter addressed to Eliza. Who Eliza is we do not know, although there are many in London who would answer to the name. We object to this mode of correspondence, whilst we are pleased with the contents. A letter to the Editor, or merely a plain article, is the mode of correspondence to which we give the preference. We suspect that it was Eliza herself who wrote the letter, and her quotation from Tacitus is an interesting fact in the history of women.

We don't like this poetical effusion of our friend so well as his last. We think he would have been less hampered and more interesting with plain prose.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 48.]

SATURDAY, JULY 25, 1835.

[Price 1d.]

SYSTEM OF NATURE.

THE last, or one of the last, sentences which St. Simon uttered was this—"It is necessary before any good can be accomplished, to impassion the people;" that is, you must speak to their feelings, and arouse their passions, for reason is merely a cool calculator, without activity and without enthusiasm. But this excitation of the people is a very difficult task. It is difficult in two respects: first, in regard to the subject-matter of excitation; and, secondly, in regard to the concentration of the popular enthusiasm upon that subject. One would naturally suppose, from the present advanced state of national and individual intercourse throughout the whole of Europe, that the task of organizing the public mind, and directing its zeal to one great and engrossing subject, is becoming daily more simple and practicable, with the facilities of diffusing universal knowledge; and this opinion is partly correct, but at the same time there is a counteracting influence at work arising from this very knowledge, the diffusion of which is the peculiar characteristic of the present age.

In former days the people were acquainted with few general subjects, and these subjects were chiefly religious. Christianity constituted one great empire, and was susceptible of excitement from one extreme of her dominions to the other. The zeal of the people was intense upon the fundamental principles of the ecclesiastical constitution; and one fortunate circumstance arousing the passion of a small corner of Germany, communicated its stimulus to the whole continent of Europe, and effected the most remarkable revolution in opinion which history records. This took place in an age of comparative ignorance and barbarism; but it owed its success entirely to the universality of the subject. There is no such subject at present, because there is a vast variety of subjects, arising from the multiplicity of popular knowledge upon every department of public affairs. This dissipation of popular strength is the principal security of the old world, and a guarantee against the timidity of the lovers of domestic peace, that the reformations which have now successfully commenced their course of progress will be urged on by a spirit of intellectual and bloodless warfare. The opinions which have been propagated within the last forty years respecting private property, and greedily embraced in secret by a great number of the working-classes, are of so revolting a nature to men of the smallest capital, that, in the event of a physical revolution, there is good reason to suppose that all the Whigs, and the most influential of the Reformers, Radicals, and Infidels them-

selves, would enlist against the people under the banner of Toryism. The cry of "Private property and its protection" will be much more easily raised than that of "No Popery."

The feelings of the public at large have been roused more than once within these few years, in a manner so imposing and irresistible as to command the concession of their most vehement opponents. But the subject was far from being universal; it was merely the destruction of a few rotten boroughs, and the introduction of the ten-pound householders into the elective franchise. This was the sum total of the great measure of Parliamentary Reform. Had the subject, however, been more universal, by comprehending the whole mass of the people in a system of universal suffrage, the excitement would have been less than it was, inasmuch as few, if any, of the nobility and aristocracy of England would have joined the popular cry. The higher orders of tradesmen and mechanics would have echoed the sentiments of their patrons and employers, and the voice of the people would have been drowned at once by their own distractions and want of organization. It seems at present quite impossible to arouse the public passion upon a subject which deserves the name of universality, involving a final principle of liberty. The work of reformation is necessarily progressive by the force of circumstances. One sectarian party acts as a check upon another, and thus reformation proceeds inch by inch in the vain attempt to please all parties.

And if it be difficult to find a political subject for popular excitement, it seems much more difficult to find one in religion. The days of religious controversy seem to be gone by. Every attempt to sound the old trumpet of alarm respecting the corruption and encroachments of Popery, has met with a signal failure. It has no more effect than a theatrical exhibition, or the performance of Punch and Judy; it excites the mass of the people to laughter, and gnaws the vitals of the priests and the few lay remnants of Puritanism with disappointment. A sectarian theological controversy can never more arouse the feelings of the public; they are dead for ever to a sectarian reformation. If religion ever awaken the public zeal once more, it can only be upon the yea and the nay of the question, "Is there any use for formal religion at all?" for the spirit of *formal* religion seems to be in a hopeless consumption.

This, notwithstanding the highly political aspect of the present time, appears likely to be the most universal and exciting subject of any in the course of a few years. It will come into repute by a variety of powerful stimulants. Its novelty, for it never was publicly discussed in the

history of man, and there is now a vast preparation of mind in the capitals, and all the large cities and towns of Europe, for its reception; its novelty will give it an interest which cannot fail to be attractive to the boy himself; and when the two parties both take their stand upon the same pillars of faith, and keep equally free from the gloomy horrors of infidelity and universal death, there can be little doubt that the doctrine of universal charity, faith, and liberality, which we have partially revealed, will gain such an assemblage of number, talent, and respectability in its favour, as never could be ranged on the side of Infidelity, which always has been, and still is, abhorrent to the prevailing feelings of humanity.

In the second place, the discovery of the ultimate relationship that subsists between politics and religion, which is yearly becoming more apparent from the stagnant spirit of the spiritual heads of the church, and the ancestral party to which they belong, must convince the people that the basis of this opposition is either a real or pretended religious principle, which it behoves them to scrutinize with the most rigid severity.

In the third place, they will find from further experience of the secret motives of the human heart, that many of the most powerful motives which urge men to the adoption or rejection of certain political principles are religious motives, and that a great proportion of the working classes are deterred from uniting with their more daring brethren, or reading those productions which belong peculiarly to them as a caste, from the simple circumstance of the infamy with which those productions are branded, as the advocates of infidelity and immorality. We have known instances of individuals, and we have no doubt that they are numerous in the country, who are actually afraid even to touch an unstamped newspaper, and look upon it with a slavish and religious fear. This fear is dying rapidly, and as it dies the spirit of religious enquiry and doubt will increase. There is a dreadful religious conflict at hand, for which the ministers of the altar have need to put on the whole armour of God; but what is the use of the armour without a sound constitution to fill it?

In the fourth place, it is evident that the principal cause of division amongst the Radicals or Reformers themselves, is a religious principle. This must ultimately develop itself in a more perceptible manner. As long as certain preliminary objects are unattained, and the immediate object of pursuit has no intimate connexion with any moral or religious subject, all extraneous and inferior considerations will in the mean time be overlooked, and a temporary suspension of hostilities will spontaneously be agreed upon. But this cannot last for ever; the great moral and religious struggle must ultimately come before the political question can be finally settled. Taking these things into consideration, we are almost convinced that political questions will disappear one by one, or be quashed by some moderate reform shuffle, to the great mortification of the people, until the whole public mind be absorbed in a great religious and moral controversy. We do not utter this as a prophecy, but we can see no satisfactory settlement of any great political question without it.

Moreover, it is in reality the most universal of all subjects, and consequently nearest akin to all others. Next to personal property, there is no individual subject more generally interesting than this. But personal property has more individuality about it. There is a secrecy and exclusiveness about a man's temporal affairs which never can attach themselves to his moral and religious interests. The latter subject is in every sense of the word common property. The poor have as good a right to the comforts and prospects of religion as the rich, and although the rich endeavour to monopolize the favour of heaven and the honours of virtue, the claim is not so valid as that of their temporal possessions, nor so exclusively maintained. Men will sooner admit all classes of characters into heaven by a new religious article of universal redemption, than admit all classes to the enjoyment of equal political rights and privileges by a new system of social community. The political principle is the strongest, because it addresses itself immediately to the senses, and being the strongest it must consequently be the most difficult to reform or destroy. No political change ever takes place without some religious reformation to precede it. The preparation of mind is effected by some principle of theological dissension, which breaks the charm which formerly bound the two departments of society together. The Dissenters and the Infidels are the movement party at present, but more especially the latter, who, having burst the bonds entirely, now form themselves into a pure antithetical party of foes to all ancient practices. If these two parties agree, it is only because they have some common object in view, which now stands upon the foreground of their political prospect, for no two elements of nature can be more averse to each other than these two bodies are, as time will shortly testify, long before they have gained the object of their political search; for, between that object and the present lies a deadly moral and religious controversy, the settlement of which alone can so reconcile the elements of society as to establish a sound political institution.

It is vain to attempt to draw a line of distinction between politics and religion. As the two subjects are at present defined, the superficial mind can easily see the difference. The business of one is transacted in Parliament, and the other in church; one refers to the laws of magistrates and courts of justice; the other to the laws of God and one's own conscience; one is superintended by priests, the other by lawyers, &c. All this may be very satisfactory to a shallow thinker, but it gives no satisfaction to one who enters deeply into the mysteries of human nature; for the very first principles of both politics and religion are the same; namely, that of doing the greatest possible good with the least possible injury. This is the universal principle of politics and religion, and you may say it is an easy matter to settle this question *politically*; but we reply, No; for men's ideas of good and evil are formed upon the religious principle, and this gives a colour and a character to all their political opinions. Were religion not connected so intimately with morals, and morals with politics, we should say that politics and religion might experience a thorough divorce;

but the constitution of human nature must be re-modelled and re-created before such an effect can take place. The separation of church and state, upon the republican principle, is merely a nominal separation. In America they are as firmly united in spirit and feeling as they are in England; and the population as much distracted in its political capacity by religious partizanship, from one extreme of passive obedience, to the other extreme of discontentment, agitation, and rebellion.

THE SHEPHERD.

ON HOMŒOPATHY.

Non equidem studeo, bullatis ut mihi nugis

Pagina turgescat, dare pondus idonea fumo.

PERSEUS, *Sat.* v. 19.

It is not my intention to swell the pages with bubbles, or to throw dust into my reader's eyes.

At a certain house, in Park-street, Camden-town, there is an inscription, which acts like a spell upon the passers-by, stops their hasty paces, and makes them stand, gape, and wonder. Even people in carriages pull their ropes, and bid the coachman stop opposite the house; and many, prompted by curiosity, have asked for some explanation. The word which startles and puzzles them all, is that which stands at the head of this paper, namely, Homœopathy—a new word, not to be found in Johnson's, Sheridan's, Walker's, nor even in Webster's dictionary; and yet this word, or rather the thing of which this new word is the visible sign, is now the apple of contention between the medical men of Germany, Russia, Italy, and France. As the politicians are divided into two parties, the legitimatists and the liberals; the divines into orthodox and heterodox; the philosophers into spiritualists and materialists; so the physicians are divided into homœopaths and allopaths.

Samuel Hahnemann, born in the year 1755, at Misnia, in Saxony, a physician of great celebrity, still living, and performing the most wonderful cures, is the author of the word homœopathy, or of the method of curing diseases by homogeneous means; that is, by small medicaments, which, when taken by a healthy person, produce symptoms similar to those which the disease presents when the doctor's assistance is requested. For instance, the powder of belladonna (deadly nightshade) produces in a healthy person dilatation of the pupil, and a kind of atrophy, or lameness of the nerves of vision: the belladonna may be employed with advantage in a disease of the eye that presents symptoms similar to those of the belladonna—for instance the amaurosis. The seeds of sabadilla produce in the healthy individual paralysis of the nerves of motion; the tincture of sabadilla is consequently a sure remedy against the paralysis of the nerves of motion, and so forth.

The fundamental principle of Hahnemann's system is, "*similia similibus curantur*," that is, homogeneous remedies cure homogeneous diseases. It is evident that this simple principle shows a deep knowledge of the science of nature, and is in a certain degree akin to our universalism. It shows that that which, taken singly, seems to produce evil, and to be a poison, is the very remedy

prepared by nature to cure a real disorder. It shows, farther that, in order to combat the disorders, you must act not by opposite, but by sympathetic means. And this is also a principle similar to that of universalism. The physicians of old, whether empirics or theorists, have followed the opposite plan; their principle was, "*contraria contrariis curantur*," that is, in order to cure a disease, we must adopt means opposite to disease. For instance, when the blood was inflamed, they prescribed cooling medicines and bleeding (Rasori, Clutterbuck); when the patient laboured under indigestion, they gave a powerful aperient (Hamilton, Abernethy); if the solids were found in a state of excitement and irritability, they prescribed contrastimulants, as, for instance, nitre, digitalis, antimony, and prussic acid; on the contrary, if they found the solids in a state of debility, they prescribed tonics, i. e., moschus, opium, serpentaria, and the like.

It is easily to be conceived that this system is not void of reason; it directs the physician to an indirect mode of curing the disease. But, unhappily, the medical art has not to do with abstract forms, or with mechanical powers. It is the living being, and with life itself, which, Proteus-like, assumes a thousand forms, and often renders all indirect means of cure idle and void. Moreover, the old medical system, whether theoretical or empirical, has never condescended to give medicaments unmixed. With the exception of the cincona, and a few other articles, which have been administered alone, and in substance, all other materials have been mixed up with so many heterogeneous ingredients, each of which is capable of exercising a peculiar action upon the human body, that it is quite impossible to determinate or to judge to which of them the cure or death of the patient is owing.

In this point of view, the critical part of the homœopathic system is unanswerable.

The homœopathic doctrine has discovered a new fact, which is likewise of the highest importance to the medical art. The remedies act beneficially—not in proportion to their weight, but in proportion to their infinite expansion; they increase their power in proportion as they are reduced, in the most minute particles and atoms.

A grain of calomel or digitalis, reduced by the homœopathic process into a thousand, yea, into ten thousand minute particles, will produce upon the human body an action that lasts for several days, which a dose of several grains, taken according to the old system, would fail to accomplish.

The experience of Spallanzani upon the infinite small particles of semen necessary to effect generation; the experience of the infinite small particles of contagious matter, which is capable of producing the most deadly diseases; the astonishing effects of the smallest vibrations in the air in expanding the sounds, and other facts, which I omit for brevity sake, are favourable to the opinions of Hahnemann and his followers. A third fact, discovered by the same illustrious author, is the homogeneous, simple diet, which must accompany the homœopathic treatment.

It is true that even the founder of the rational medicine, Hippocrates of Cos, had paid great attention to

dietetics; the great Sydenham had also endeavoured to impress upon his contemporaries the necessity of a proper regimen; but Hahnemann was the first to lay down scientific rules, and to make the dietetic prescription a part and parcel of the whole treatment.

Experience, which is the supreme guide for matters of fact, has fully justified the theory of the homœopathic system. Not only in chronic diseases, but also in the Asiatic cholera, in the malignant scarlatina, and other acute diseases, this method has proved highly superior to the usual practice.

In regard to the chronic diseases, Hahnemann had discovered that all are depending upon three original causes, namely, syphilis, sycosis, and psora. According to his views, the physician must endeavour to find out which of these causes be the original cause of the chronic distemper. The cure would be mere palliative if this primitive cause was not conquered.

The fundamental principles of Hahnemann's system are laid down in his *Organon of Medicine*, which has been translated from the German into all modern languages, and also in his *Materia Medica*, and in his *Treaty on Chronic Disorders*. The *Organon* has been lately translated into English by a Mr. Deorient, and was published in Dublin in 1834, revised by Dr. Stratton.

An able article upon this subject appeared a few years ago in the *Edinburgh Review*; and that noble patriot, Dr. Borthwick Gilchrist, had the frankness to make known to the public a cure performed upon him by a homœopathic doctor in Switzerland.

The Alpine Philosopher was the first to introduce this method of cure into England. Before appearing in public as a medical writer, he had practised this system amongst his friends with the greatest success. He had cured, radically, in a short time, a whole family of nine persons, old and young, attacked by the malignant scarlatina. Many female complaints were cured by him with the same method, besides syphilis and asthma. At present, it is the principal method which he employs, with or without tellurism.

The homœopathic treatment deserves particular attention, because it never can do any positive harm; if it does not cure the disease, it never injures the patient's constitution; it never impairs the powers of nature; never causes a new disease under the pretence of curing another. I am, however, not such a bigotted adept to this system as to condemn the opposite one in all points; there are cases in which I should consider it to be a crime not to resort to prompter and more vigorous means. No man, with a sound mind, will deny that, in some inflammations, cold applications, blood-letting, and leeches, produce instantaneous relief. No person will refrain from using blisters, or even the moxa and the emetic tartar, in the affections of the brain, or nitrum, digitalis, and vesatria, in counteracting the too rapid circulation of the blood. A homœopathist must not be a mere empiric, but a rational being. Homœopathy is not a universal medicine, but a part of the whole science of nature.

For those who wish to learn something more about this subject, I recommend, besides the works of Hahnemann, the works of "De Brunnow Exposé de la Reforme de

l'art Medical par Hahnemann.—Dresden, 1824." "Rati Dr. Geschichte und Bedeutung des Homœopathischen, Heil Verfahrins.—Giessen, 1833." "Bibliotheque Homœopathique, par Peschier.—Paris and Geneva, 1833, and following." "Archiv für die Homœopathische Heilkunst.—Leipzig, 1832, and following." "Bigel Dr. Examen Theorie et Pratique de la Methode Curative du Dr. Hahnemann."

THE ALPINE PHILOSOPHER.

LYING, FALSE SWEARING, &c.

VERY few people are aware of the extent to which the spirit of deception has extended itself in these days of reformation and home missions. If virtue is increasing on the one hand, in the general education and refinement of the public mind, vice is evidently keeping pace with it in growth, manifesting such a degree of skill and unblushing assurance in the perpetration of her knaveries, that the two principles seem pretty well matched. Vice is so far inferior to his prosperous and rapidly-advancing antagonist, that he is ever obliged to retreat before her, and invent new schemes of deception, to accomplish his fraudulent purposes; but his ingenuity is inexhaustible, and there appears no termination to his line of progress.

Lying is one of the fine arts, as we showed two weeks ago, but it is one of the black arts also. When employed in fable, parables, and allegories, it is very effective in commanding the attention, and imprinting valuable moral instruction upon the simple mind. Some austere theologists who have entertained very strong prejudices against this moral employment of falsehood, have only been checked in their violent denunciation of the practice, by the example of Jesus Christ himself. But the spirit of the age has been too powerful for their feeble resistance, and the genius of poetry and romance has established the respectability and innocence of fiction for ever.

A lie is only a moral crime when it is productive of evil to individuals or the public. Happiness is the object we have in pursuit, and if lying were more calculated to promote this end, truth itself would become a vice. Mere truth is a phantom—less than a phantom, for it has no visible existence. We cannot see it, hear it, or feel it. It is a mere imagination, an idea that flickers in the mind, which, abstractly considered, communicates neither pleasure nor pain. It is only by association, or its connexion with the senses by which pleasure is enjoyed, that truth becomes valuable. It promotes harmony between man and man, and this harmony gives security to the body, and enjoyment to the social intercourse of life. It teaches the knowledge of nature's laws, and this knowledge enables us to subdue the materials of nature to our services, and multiply the pleasures of public and private life. A mere abstract truth, if we can conceive such a thing, that is, a truth which can have no practical utility in promoting the happiness of society, is of no value; nay, we may easily suppose a case in which the greatest mischief may be effected to individuals, or even the public at large, by the revelation of truths which are now utterly concealed, and sup-

planted by lies, which for the time being are infinitely more beneficial.

But although it be wisdom in Providence to withhold certain knowledge from man, and even to deceive him by a species of false knowledge for a time, no individual is justified in imitating this example, by imposing upon society for his own individual advantage. That which may be of great utility in the whole, may prove very destructive in part. Universal lies deceive the whole of society, and still preserve unanimity; but partial lies make a division in the body politic, and engender horrid evils. The greater proportion of the evils of society may be traced to deception.

Lying and false swearing have always been practised, and are in part employed by every grade of society to accomplish their own selfish purposes. The legislators of the country, who devise means of repressing vice and encouraging virtue, are in the literal sense of the word for the most part perjured characters. They are bound by oath not to interfere with the freedom of election, not to influence the will of electors, by donations of money, by promises, or any other illegal method; but this solemn engagement is no more in their mouths than a puff of tobacco vapour. The clergy are sworn to humility and self abasement, and solemnly declare that they have entered upon the ministry of the gospel, not for love of worldly gain or temporal aggrandizement, but purely for the love of God and the salvation of the souls of men, by what they esteem an especial call of the Holy Ghost. They take the oaths without fear or trembling, and sign the creed which one half of them have even the effrontery to refute in their public discourses. These are our most respectable men, the leaders of the political, religious, and moral departments of society!

Why then should we be astonished to find so much lying and false swearing amongst the people? The evil in the one case is not greater than in the other. Both do it for the same end, personal interest; but the priest contrives by one or two thundering oaths to establish the security of his fortune for life, and consequently, being well paid for one transgression, he has no particular temptation to repeat it, in form; but all his life is a lie to his profession. The legislator frequently practically transgresses, and the priest is generally his lieutenant in the transaction; however, the offence is respectable, done with cunning, and it takes a considerable amount of private wealth, and greater amount of private patriotism, to bring the offender to justice. The poor perjurer is so miserably paid for his not more mercenary or interested services, that he is tempted to repeat the transgression frequently, in order to procure an existence. It is a fact that there are many who make a living in London by acting the part of false witnesses in our courts of justice. These gentlemen have even cards, which they hand you in the fashionable style, giving you a hint by a whisper in the ear, that they are at your service in any emergency, and are willing to make up a case for you. This accounts for the curious contradictions that are to be found amongst witnesses in our police courts. One swears that there was gaming in a public-house at a cer-

tain hour; another swears that he was there at the same time, and saw no gaming. The magistrate is confounded, and dismisses the case. It is astonishing how successful those false witnesses are. They make it their glory to outwit the lawyers, and many of them are more cunning than the shrewdest counsel. There are even lawyers of wealth and *respectability* who live by suborning such witnesses.

All this is horrid, but who have to answer for it? Look to the political and ecclesiastical rulers of the land, and you see the very stock upon which all such branches grow. To lop off the branches is of no use, but this is all that our criminal judges are doing; you must destroy the root and the stock as well as the branches, or young shoots will come out as soon as the old ones perish.

DUPLICITY.

“Duplex libelli dos est.”—*Æsop.*

LACKING philosophical perception, the world has exalted simplicity from its native degradation at the expense of duplicity, which is condemned to the imaginative shade of ignominy and disgrace; whereas simplicity is little more than another name for stupidity, in whatever way it be employed. If you talk of a simple natural production, that is of a thing as having but one character or attribute, either the whole is nonsense, or there can be no value in the thing spoken of till it be united to some other thing, so as to form a twofold or duplex existence. If you talk of a simple mind, clear enough is it you will describe a fool. Whosoever pours out the whole of his mind without any reservation, is evidently a simpleton, and is no more calculated for a truth or knowledge-holding vessel, than is a sieve to contain water; and consequently he has none.

That the truth is not to be spoken at all times, needs no proof to any who have thought seriously on the matter. That lies are ever to be told, is not so clear; because early impressions and priestly precepts counteract reason and the spirit of universal love.

The Delphic oracle appears to have been most remarkably, because most studiously duplex in its expressions; for which reason it might fairly be determined that its managers were in higher consciousness than is generally supposed, and really had the people's welfare in view. Every man in a superior state will, and indeed must, unless he lower himself to a valueless condition—“palter with us in a double sense.” This arises partly from the necessities of language, which is not capable of holding every delicate, thoughtful shape and distinction, which powerful minds have to utter. But it arises more from the fact of nature's duplicity, which allows the hearer to place the speaker's expressions on a lower or higher level, accordingly to his relative state. Duplicity, then, does not involve the idea of deception, unless it be self-deception. Men who are not developed to any interior consciousness will, of course, continue to demand that we speak with simplicity and truth; a demand as preposterous as to call for a material substance, with quality without quantity: and further, as duplicity is the characteristic of philosophy, and philosophical speech, so tripli-

city pertains to expressions coming from a still higher conscious state. Many individuals have perceived this quality in the scriptures; and it might be suggested as one cause of religious sectarianism, founded on those writings, that they contain such threefold expressions, and that it is necessarily threefold for the reason before stated. Language, at least the English, though such power is vulgarly attributed to the Egyptian, or its modifications, cannot express religious emotions and phenomena, without employing words also used for intellectual or natural phenomena. If men did endeavour so exclusively to express themselves, their expressions would be, and indeed are, immediately appropriated to lower uses. Hence the result of reading depends not less upon the reader's state than upon the writer's. Now, if there be a threefold expression in the scriptures, and individuals may be in one or other of three states, it is arithmetically evident that plenty of controversial fuel is necessarily in the truth itself, without considering the additional quantity human waywardness will bring to the flames.

All the human care possible will not transfer existences from the speaker's to the hearer's mind. Where parties willingly commune, just conception, though probable, is not certain; when the will is perverse, expressions are easily perverted.

C. L.

[As the next and final sentence of our correspondent is not very intelligibly expressed, we supplant it by saying that we have no right to say there was any imposition in the Delphic Oracle. It was genuine, direct inspiration. It would take a very large throat to swallow the absurdities attaching themselves to a contrary supposition.]

TO THE EDITOR.

SIR,—You have in your last number inserted an article which calls for some remark from one whom you have classed amongst men without principle, without definite object in view, but the artificial settlement of inveterate quarrels; who take no interest in the subject of discussion (religion), and care not how the dispute is settled, provided it is settled amicably: men who are indeterminate, unprincipled, apathetic; mere negative men, and therefore inoperative. In this number you class Deists and Unitarians, of whom you say, they are neither believers nor infidels, but cold as ice to the enthusiastic spirit of both, and extremely lukewarm upon all religious subjects. This party you denominate the Unitarian party, which, placing in the vanguard, and making extremely useful in keeping in check the follies of others, you declare to be, after all, nothing. "Its strength lies in silence; it has no doctrine, no system; it knows not itself; it only despises the two extremes, and avoids them both. It has entirely abandoned the whole field of theology." Now, Sir, if by this description you intend to designate *inter alios*, the Unitarian Christian, I should conclude from one of the characteristics that you are one of the party. This characteristic is ignorance of the system. "It knows not itself." Your own description demonstrates your ignorance of the subject; you know it not: and, therefore, you possess at least one qualification for admission into the fraternity.

The great defect of this party is its negative character; its having no doctrine, no system. How, Sir, can you say this of the Unitarian Christian, and still affix to the document the signature of "The Shepherd." It is true that

this party gives a decided negative to many of the opinions now prevalent in the religious world: and that, from the circumstance of its having to combat the national prejudices of the age, it is frequently compelled to adopt the negative style of argumentation, and to eradicate the thorns and thistles which infest the soil. But never yet have I found one of the Unitarian Christians (and I think, Mr. Shepherd, I have known more of them than yourself) who thought of disencumbering the soil for any other purpose than that of rendering it fit for the reception of a better seed, and the production of a more valuable crop than that which is destroyed.

To come to the point. Is that a negative system—has that no doctrine—which teaches that one ruling and pervading Spirit, whose character is love and wisdom, produced, and presides over the whole creation, natural and moral? Is that negative which teaches that the Redeemer is the chosen of the one God, specially instructed, strengthened, and empowered, for the purpose of conveying to sinful man that glorious Gospel of the grace of God, which points with certainty to a life hereafter, where all shall receive according to their deserts? Is that negative which points to the empty tomb of the once bleeding Saviour, and directs the eye to the right hand of the Majesty on high, where that Saviour sits enthroned in glory, the emblem and pledge of the future exaltation of the humble and devout believer.

If, Mr. Shepherd, to teach that there is one overruling Providence constantly directing the powers of nature, for the production of universal good,—to teach that the spiritual and moral wants of our nature have been provided for in the various dispensations of grace, as fully as the natural ones have in the material creation—to illustrate and enforce the doctrine which brings life and immortality to light—to aid in the work of purifying unto the Saviour a peculiar people, zealous of good works; if this, and much more of a like character, is to be negative—to have no doctrine, no system, I should wish to be informed what constitutes a positive system of doctrines. It must be a conformity with the popular opinions (truth or prejudices) of the day and nation. Thus the Primitive Christians were termed contemners and despisers of religion and the gods (mere negative men), because they opposed the peculiarities of heathenism. Thus the Protestants have been, and still are, considered by the Catholics as holding a negative principle, because opposed to the more glaring corruptions of the Catholic church. Thus the Methodists are charged with a negative character for rejecting the doctrines of election and reprobation; and thus the Unitarian Christian is charged by the self-styled Orthodox, and, it appears, by the advocate of "Universalism," with holding a purely negative principle, without system and without doctrine, because he devotes the energy of his mind to the eradication of that which is evil alike in every class and in every sect. The truth is, Sir, that all sects of Christians have imbibed from the Gospel all its great and leading features, and each has mixed with these his own peculiarities. Your simile of the ocean, the tides, the currents, the dashing to and fro, &c., is all very fine and very pretty, as the ladies would say; but, Sir, the agitation so frequently observed, if a landsman may form an opinion (though you, Sir, living so near the Thames, which, I suppose, is in your neighbourhood very wide and very like a sea, must know better), is often superficial, and does not affect the great body of the water below. So the dashing and the froth of Polemic controversy is of the same superficial character, making sad havoc, destruction, and shipwreck of the several cock-boats which men have attached to the

great vessel, to tow her safely into port, whilst the vessel itself majestically presses forward, urged on steadily by that strong undercurrent, in which the whole weight of the water participates, and which is consequently irresistible. You say, truly, that the ebbings and flowings of the human mind are merely oscillations between one extreme and the other. The true standard, therefore, must lie between the two. What you denominate the Unitarian principle is not this standard simply because it is a negative. I have endeavoured to show that Unitarian Christianity is no negative—that it has a system and doctrine positive and determinate. Is there nothing positive held in common by Catholic, Protestant, Calvinist, and Arminian? There is much. This common Christianity the Unitarian seizes, and giving to the winds the peculiarities of each, abides by that which is the common inheritance of all Christians. But, again, you say that this Unitarian party is extremely lukewarm upon all religious subjects, and has entirely abandoned the whole field of theology. Are you not aware that, confessedly by all parties, some of the best and most able defences of our common Christianity against the attacks of infidelity, are the productions of this Unitarian party? Do you not tell us that whenever either extreme party has passed the bounds of moderation, and risen above its natural insignificance, this party has stepped in, and effectually corrected the evil? How is it to do this?—how to defend, successfully, the basis of all our theological systems?—how check that extreme which would carry the spirit of scepticism into all our opinions?—and how restrain that which, passing the limits of authority, would palm on us, as the oracles of God, the wild wanderings of a distempered imagination? How do all this, whilst lukewarm on all these subjects, and having entirely abandoned the whole field of theology? Does not all this imply such a knowledge of the just boundaries of theological speculation as can result only from a patient, calm, and persevering study of the subject scarcely compatible with lukewarmness or indifference on all religious subjects?

"*Audi alteram partem*" is a maxim received and adopted by this negative party; and, if it is not inconsistent with your positive, determinate, tangible, "Universalism," I should be glad to obtain insertion of the foregoing in your next *Shepherd*. By the way, the people about here complain (poor grovelling souls) that your positive, determinate, &c. &c. &c., is so vague, misty, and undefined, that they can make neither end nor side of it; and they are constantly enquiring of your friends "What is this system of the *Shepherd*?" You will, therefore, instruct them, and relieve your friends, if, before you close the work, you tell us what the system is.—Yours,

Padiham, 4th July, 1835.

H. D.

[This letter does not treat us with perfect fairness, and moreover, it ends with a taunt. We shall not reply in the same style, if we can possibly avoid it, but merely show this unitarian that he is more offended with us for casting a sort of shade upon the sectarian name of Unitarian Christian, than for asserting anything which he believes to be false. Whatever we said of the lukewarmness of the unitarian party, we qualified by admitting many honourable exceptions. "There are many exceptions to this general rule, but this is their prevailing character," were the words we employed, and therefore they could be offensive to none but those who worshipped the name and the party which it designated. With regard to the positive character of unitarianism, it holds it in common with every other sect or party in existence; each has a positive, particular, or partial character, but each is negative in its universal character. We don't

require to be told that the unitarians preach the faith of one God, just and merciful, and so forth; for in this they are the disciples of the same theological absurdities as the churches of England and Rome, with whom they agree upon the subject; but they are certainly purely negative in respect to the evil which proceeds from God, for we know of no sect of unitarians which makes the deity all and in all, or gives us anything rational or intelligible upon the subject of moral evil. They may say that God permits it; that man's ignorance makes it, &c.; but all this is purely negative, in the universal sense, for it does not ascribe it to the great universal mind as the positive cause of it. So far, therefore, they are negative universalists, like every other sect in existence; and all their articles of faith respecting Jesus Christ, his manhood, inspiration, exaltation, &c., only expose their limited views of God and his providence in a more glaring light. If our correspondent imagined that we regarded the unitarians, or any other party in existence, as purely and totally negative, in respect to particular doctrines, morals, &c., he entertained an idea which never for one instant of time had a lodgment in our imagination. Every system, if system it can be called, is a negative, which does not reduce the subject matter of which it treats to some definite first principle. Does unitarianism do this? If so, pray where are its articles of faith to be found, or if found, not palpably and ludicrously contradicted in their exposition and illustration? It behoves the unitarians to show a unity in their unitarianism, before they can lay claim to positive universalism. We shall be very happy to find ourselves mistaken.

Moreover, we did not allude to the unitarian Christians alone, but to the deists and unitarians together, which party we classed under the name of the unitarian party. We could never have committed such an egregious blunder, as to affirm that the unitarian Christians "were the greatest and most powerful party in the land," for it is really the smallest and most unpopular of all religious denominations; but the spirit of negative deism, which is the characteristic spirit of the whole of that class of people who generally go by the name of deists, and is also the spirit of the unitarian Christians—is the spirit to which we alluded under the name of the unitarian party. If our correspondent does not understand what negative deism is, we will explain it. It is that sort of deism which nominally professes the existence of a God, and yet either denies his interference with worldly affairs, or admits only a partial interference. This latter is the unitarian Christian's doctrine, and also the doctrine of the trinitarian Christian. One is a unitarian negative, the other a trinitarian negative. Our correspondent says Jesus Christ was chosen of God: ask him if Mahomet was not chosen of God also.

Were he to read the *Shepherd* carefully, we have no doubt that he would understand it. It only wants the will. Colonel Sibthorpe complained last week, in the House of Commons, that the House had not been put in possession of the knowledge of the principles of the Municipal Reform Bill, and maintained that it was a very foolish mode of procedure to require an acknowledgment of a principle where no principle was seen. This is the common cant of the spirit of opposition, and therefore we pass it over without much concern. But many have acknowledged themselves pleased and satisfied with our universalism, and this is quite enough to make the balance even, and give repose to our minds. We know that the positive and negative division of the subject has puzzled many, and very probably the fault has been

own. Some one better qualified, perhaps, may soon appear, and make it more intelligible. Of its infallible truth, and truly philosophical accuracy, however, we are perfectly and undeceivably satisfied. But the greatest blunder into which our readers and opponents fall, is that of taking the negative in a *bad* sense. The negative is as useful in its place as the positive; only there are separate or sexual departments in nature for each. We shall attempt to throw some light on this subject beforewe close.]

SWORDS AND GUNS.

SWORDS are not so ancient as many other weapons of defence used in war. The club, the pole-axe, the spear, and the lance, are no doubt more ancient. Swords have not been generally used, till within the last four or five centuries. Birmingham has been famous for the manufacture of them for many centuries, and no doubt from its earliest infancy. Previous to the American war, however, English swords fell into disrepute, and application was made, October 1st, 1783, for leave to import swords and sword-blades from Germany. A member of the board of trade, the Earl of Surrey, afterwards Duke of Norfolk, wrote to Mr. Eyre, of Sheffield, to inform him of this fact, and to solicit such information as would enable him to rebut the statements made upon the inferiority of the English blades. The people of Sheffield were makers of cutting instruments of the more civil kind; Mr. Eyre, therefore, referred the letter to Mr. Gill, of Birmingham. Mr. Gill memorialised the lords of the treasury, stating that swords could be made by him equal to the German ones.

In 1786, one of the East India orders was divided among the English and German manufacturers. Mr. Gill obtained an order from the board to have the swords of the two countries tried by a test which reduced the blade from thirty-six inches to twenty-nine, from hilt to point, by forcing it into a curved state. Four swords only were rejected, out of two thousand six hundred and fifty-four, presented by Mr. Gill; one thousand four hundred and twenty-eight were presented by the German manufacturers; one thousand four hundred were received, and twenty-eight rejected; the other English makers presented three thousand seven hundred and eighty-four, out of which only two thousand seven hundred were received, and one thousand and eighty-four rejected; this being in proportion of one to thirteen in favour of Mr. Gill's swords, as compared with the foreign ones, and one to one thousand as compared with the others made in England. Sword-blades are made from the best cast steel, and considerable skill is required, in addition to the best materials, to forge them to stand the test which they are always put to. Upon this, therefore, the first operation, depends their quality. They are taken from the forge, and undergo the first proof. They are struck upon a cylindrical block of wood, upon both edges, the operator using all his strength. They are then struck with great force upon each side upon a flat slab of very hard wood. One end is then placed between two fixed bars of iron, and a hand-wrench applied to the other, till the point forms almost a right angle with the shoulder. If in any of these operations the blade breaks, cracks, or does not recover its shape, it is returned to the forger, who is at the loss of his labour and the steel. When a bad lot of steel has been in use, I have known nineteen out of twenty break. A good workmen, with good materials, will forge fifty blades without producing a bad one. From the time of the

French Revolution till 1814, a considerable trade was carried on in Birmingham in this business.

In this, like all other trades where the demand is great, many divisions of labour take place, and it forms about twenty distinct branches, exclusive of the preparers of the materials, toolmakers, &c. Many thousands found employment in Birmingham during the war. Some few made fortunes, but many were reduced to penury, after the peace of 1814.

GUNS.—Though the sword and the gun are equal companions in war, it does not appear that they are of equal original. I have already observed, that the sword was the manufacture of Birmingham in the time of the Britons. But tradition tells us, King William was once lamenting, "That guns were not manufactured in his dominions, but that he was obliged to procure them from Holland at a great expense, and greater difficulty." Sir Richard Newdigate, one of the members for the county, being present, told the king "That genius resided in Warwickshire, and that he thought his constituents could answer his majesty's wishes." The king was pleased with the remark, and the member posted to Birmingham. Upon application to a person in Digbeth, whose name I forget, the pattern was executed with precision, which, when presented to the royal board, gave entire satisfaction. Orders were immediately issued for large numbers, which have been so frequently repeated, that they never lost their road; and the ingenious artists have been so amply rewarded, that they have rolled in their carriages to this day. Thus the same instrument which is death to one man, is gentee life to another.—*Guest's edition of Hutton's Birmingham.*

TO CORRESPONDENTS.

The letter of a Mechaic from Liverpool reached us only a few days ago; it almost lost its way for want of an address. "To the Editor of Shepherd" is not a sufficient direction in such a place as London. We have sent it to its proper quarter, but should not advise him to come to London.

We perceive that Sir Richard Phillips has published a work called a "New System of Natural Philosophy," which professes to overturn the principles of natural science which have hitherto been current in society. We shall give our readers some idea of it before we part, as Sir Richard is an original character, and has a good genius for chemical and physical science, except that it is monstrously deformed by certain absurd atheistical notions, which neither he nor any one else can understand. One of the greatest geniuses which Germany ever produced, namely, Schelling, was of opinion that universal being divided itself into three great stages: first, chaos; second, nature; and third, the reign of an Universal Spirit, who is not yet brought forth, but *will be*. This an excellent writer of our own country calls a splendid piece of philosophical lunacy; but it is a very good emblem of the progress of society. How men of genius can run so wild is hard to understand. We suspect it is merely from a love of singularity in many cases. Sir Richard is not a whit less fantastical, with his dancing atoms of oxygen and hydrogen as the great creators of all things. "These are thy gods, O Israel."

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 49.]

SATURDAY, AUGUST 1, 1835.

[Price 1d.]

SYSTEM OF NATURE.

As many of our readers experience some difficulty in understanding the twofold division of positive and negative, which characterises our doctrine of universalism, we shall attempt to throw some light upon the subject, and afterwards, according to promise, condense our views into the short compass of a general synopsis, or set of articles, with which we shall conclude the *Shepherd*. We cannot do better than close with the very same subject with which we commenced, for Nature herself is the same yesterday, to-day, and for ever; and all the progress of human intellect is nothing else than a movement from an imperfect to a more perfect view of the same eternal subjects, in which there are no variable-ness nor shadow of turning. Any change which we experience is merely that of position and clearness of vision, by which more light appears to our mental eye upon the phenomena of Nature.

Now be it remembered that we are making no boast of our ability to explain or illustrate the sublime doctrine of universalism, in such a manner as necessarily to captivate the fancy of the general reader. This power neither belongs to us nor to any one else, though there be many in the world who are much better qualified to investigate and illustrate the subject than we are, provided only they had imbibed the primitive principles. What we can do, we do; we throw out our thoughts amongst the countless myriads of our fellow creatures, without knowing what impression they make, and without much study of the previous state of the reader's mind, for that state is so infinitely variegated amongst such a mass of thinkers, that the study of it would only render our minds more confused. We catch as much as possible the general and prevailing sentiments of large masses, and we illustrate them in a similar way, by analogies as universal and generally accepted and undisputed as possible; because we conceive we have to begin with the broad basis of thought to lay a sure foundation in universal principles, before we can profit much by the investigation of isolated facts. Facts we know are the foundation of universal principles; and therefore the cavillist may say we ought to treat of insulated facts alone, as in these alone consists eternal truth. We reply, "*there is no truth in a fact.*" What is a fact, but merely a guide to the discovery of truth? Truth is a principle, and if we do not attain to the knowledge, the inward perception, comprehension, and incorporation of that principle, facts are not of the slightest use to us.

Now how long are we to be thus hunting after facts?

How many facts must we have before we can discover a universal principle? How large a capacity of memory must we be possessed of, before we can know the truth? How many books must we read, how many languages must we learn, how many sciences must we comprehend? We ask again, how many? No man can answer, for there is no end to human learning, no limits to the number of literary and scientific productions, no termination to discoveries and inventions. We may wait till doomsday before we know the truth, and not even find it then, if it cannot be found without a combination and comprehension of all known and knowable facts.

We maintain, that very few facts are necessary to know the truth; that men of capacious memories and splendid talents, brilliant meteors of intellect, who dazzle the eyes of all the puny creatures of the same species who attempt to exhibit symptoms of intellectual life in their presence, are really as far from the truth as those simple, unfurnished, little apartments of mind, who merely take general and comprehensive views of creation, and reduce all the phenomena of nature to one general principle. Such men are the true men of judgment, the real pilots and mechanists of society after all, by whose moderate and temperate views of things the over-excited brains of poetical statesman and theoretical mechanics are finally subdued, after having suggested a few useful and ingenious hints amidst a rubbish of sophistry and splendid philosophical insanity.

Of those facts the most important are the fundamental facts of all science. Now the very first and only fundamental facts of all human knowledge, are what we call the *positive* and *negative* forces, but a thousand other names, such as active and passive, male and female, &c., may do quite as well. We maintain that universal nature resolves itself into these two, in all conceivable circumstances, without a single exception. These, therefore, are the pillars of truth.

Notwithstanding, there is no power in nature which is exclusively either active or passive, positive or negative, but each is both active and passive, and more or less so in different circumstances; the negative or passive is the weakest in that capacity in which it is viewed as a negative, but it may be the strongest in another capacity in which it acts positively. Thus woman is negative to man in a political capacity, but she is positive to man in a sentimental and moral, or feeling capacity. Hence women in general give place upon political subjects, and man bows to the superior delicacy of woman on moral subjects. This is perfectly intelligible to all; consequently the following paradoxical doctrine necessarily

comes out of these two premises, namely, that men and women are both positive and negative to each other. If so much water is thrown into the fire as entirely to extinguish it, the fire is negative to the water; but if on the contrary the water is overcome, and the fire recovers its strength, then the water is negative to the fire.

Apply this mode of reasoning to our universal principles, and the whole doctrine becomes palpable enough. There must be two views of every subject—one for evil, or disunion and contention; another for good, or union and peace. Now every doctrine is either positive or negative to one of those two objects, for every doctrine is supposed to have a practical tendency.

All the sectarian doctrines of religion and politics, (we speak, however, in the *Shepherd*, chiefly of the former), are positive in respect to the first of those objects, because they produce the effect of evil and contention, whilst the doctrines of universalism are negative in this sense; consequently our friend from Padliham last week was perfectly correct in saying that unitarianism was positive in its character, and we were wrong in denying it; but it is positive *in malam partem*, that is, in the bad sense of the term, inasmuch as it propagates a doctrine of separation, by dividing God from the universe at large, and regarding evil, and all the errors, and deceptions, and follies of human character, as some excrecence upon nature, with which God has no active but merely a passive concern; that is, he does not actively create those evils, but merely *passively permits them*. This is the character of every religion under heaven; they are all positive in this evil sense, and we acknowledge ourselves decidedly negative.

But let us reverse the picture, and take the second object in view, merely union, liberality, and charity. Here, now, we find them all negative together. They cannot teach charity, because they deny the divinity of each other's mission. They cannot reconcile their own with others' doctrines. They give one doctrine only a heavenly origin, and ascribe all the rest to some other extraneous power, which some call one thing, some another. They cannot ascribe all to one great fountain, all to God, as the active, not merely passive, cause of all those varieties of thought; consequently, they must be negative universalists; whilst we, in direct opposition to them in this view of the subject, are positive universalists. If this is not plain and intelligible, we are almost inclined to think that the fault is not in us, but in the reader himself.

But still, the infidel, the materialist, and the atheist, may reply, "Upon what authority do you call us negative universalists, since we also acknowledge with you that all opinions originate in one source?" We reply, "You are negative by your own profession. It is even your boast to be purely negative, since you deny the operation of will or intelligence in the movements of Nature. Suppose my body is making particular gesticulations, over which I have no control; suppose I were rolling down a hill and could not stop; suppose my muscles were contracting and dilating themselves in spite of my will, and giving a thousand antic features to my countenance and positions of body—whether in my-

self positive or negative in all this? Every man who knows the meaning of words would immediately reply, Negative, certainly; merely passive; the will has nothing to do with it. But this is merely a model or emblem of the NATURE of the infidel, materialist, or atheist. His universe works in this involuntary manner, without the operation of a will, and without any purpose or intention. Consequently, in the highest and most comprehensive sense of the word, he is a negative universalist. By infusing a will and an intelligence into Nature we make it active and positive, and thus reverse its character."

Thus, then, it is evident we stand on the opposite side of every sect of believers or unbelievers under Heaven. Christians, Mahometans, Pagans, Infidels, Atheists, all are negative in their universal philosophy; and if they are not, let them come and show us and our readers that they are not, and not accuse us of ignorance, who know them better than they know themselves. That we stand alone as positive universalists we affirm; and it is our first and strongest wish to see the world adopt the principles of charity and general unity, which positive universalism alone can teach.

But then we affirmed that both the negative and positive are good in their place; for all nature is a wise and infallible system, under the guidance of an infinite, omnipresent, omni-active mind. Assuredly we said so, and still affirm it; but although every thing is good in its place, every cause, every instrument of Nature, has its work or sphere of operation. Evil itself is good, as we have already shown. Good for a temporary lesson in the mysteries of Nature, without which we could not be twofold intellectual beings, and, consequently, could not be beings at all: could have neither thought nor action. But evil is not the object sought; it is merely a mean to an end. Disunion has been useful, as we have frequently shown, but union is more productive of happiness. Sectarian doctrines, or negative universalism, have produced disunion, and never can effect any thing else; but they investigate facts, sharpen the intellect, and prepare the human mind for positive universalism, which alone can take us out of the land of Egypt, and out of the House of Bondage. The application, therefore, of a doctrine of negative universalism, for the purpose of effecting a reconciliation amongst men is a vain and foolish attempt of an ignorant mind, which has never analysed Nature correctly, nor discovered her two everlasting pillars of positive and negative action. Yet, although sects fail, and ever must fail, in the attempt to bring forth union by a divisive doctrine, they are still doing good, and preparing the way by the destruction of one another. They are removing the stones, and ploughing the field for him who sows the seed of the Word. Whilst, at the same time, there is not one party amongst them which has not some peculiar doctrine characteristic of itself, which is of essential importance to the tranquilization of society, and the reconciliation of men.

From what we have now said respecting positive and negative, we hope it is evident to our readers, that when we use the two terms without particularly defining our acceptance of them, we use them in their universal, and

not in their partial sense ; that when we call a sect or party negative, we mean in respect to its universal views of Nature, and the workings of providence and the destiny of man ; for, in the opposite sense of the word, the very doctrine which we designate as negative becomes a positive. Most probably we have erred in not being sufficiently explicit upon the subject. We have not all our wits at command, when they happen to be called for, and we cannot altogether place ourselves in the mental circumstances of those who have not been accustomed to think as we do. We are, therefore very apt to be misled by an idea that we are more intelligible than we really are to the general reader, to whom the whole process of reasoning is a novelty, even although the subject appears childishly simple, and incontrovertible in our own estimation. But we have no fear of the doctrine falling into disrepute, though we should never write another syllable in its favour. It is clear as sunshine, and mathematically certain, that no peace, either political or religious, can be effected without it. Forget it, if you can ; distress will force you into it. Fell Necessity is your teacher, and in his hand we leave you.

THE SHEPHERD.

CHILDREN.

"Old maids and old bachelors' children are always well bred." This is an old proverb, which implies that we are much more confident and successful in the theory than in the practice of education. In theory we have it all our own way ; our minds are cool, our tempers are undisturbed. The dulness, the obstinacy, and perversity of the young brats, are merely ideas which flicker in our own brain, and come or go at the word of command. Not so in the practical department. The powers we contend with are then real ; and though, like Captain Bobadil, we had subdued them all in imagination long ago, like Captain Bobadil also, we flinch before them when the contest becomes serious. Hence all fathers and mothers, like the authors of books, experience all the difficulties of rearing and educating children ; and bachelors and maids, like the critics and reviewers, point out the faults which the others have committed,—the weakness and ignorance of human nature which they have displayed.

The advices which are given to parents, guardians, and teachers by these doctrinaires of education are ludicrous to one who has any experience of the discipline of children. One says you must study their tempers ; another says you must allure them by kindness, indulgence, and tenderness ; another (but such instructors are now almost forcibly silenced by the spirit of the age) rudely exclaims, "study no tempers ; let them study yours. Show them no indulgence, unless upon conditions of obedience. Don't be passive to them, but make them first passive to you. The pupil is the clay, and the master is the potter." This latter is the old system, and there cannot be a doubt upon the subject, that the discipline and subjugation of former times were much greater than now. The present age is an age of insubordination and disobedience, both in families, schools, and the higher departments of political government.

I consider all of these modes of discipline indispensable necessary in certain circumstances. With the poor there is a greater necessity of bodily punishment of children than with the rich ; for their domestic accommodation being extremely unfavourable for the proper training of youth, and the total privation of all those juvenile amusements and toys which so continuously employ the activity of the children of the aristocracy, make it a matter of greater difficulty for the poor man to keep his children out of mischief at home, or from the company of depraved companions abroad. The rod becomes then an indispensable prescription, only for want of a better. It is the lot of the poor, and they cannot with safety dispense with it, until they enjoy the same advantages as the rich. But even the rich are losers by the indulgences of youth. It is the rational or indulgent system of instruction in the nursery, where the rod ought to be the master, instead of a horse to ride upon, that makes them so imperious and supercilious in their conduct. They suffer no contradiction in infancy and youth, and they cannot bear it in adult age. The school of opposition and restriction would implant a finer spirit of order and discretion than can ever be acquired under the regimen of their supple mammas and their obsequious nursery-maids. In a world like this the training of human beings to the observation of rules, be they ever so trifling, is of essential importance to the formation of a good character. If we had less indulgence of perty whims in youth, we should have less self-will and overbearing obstinacy in mature age. Therefore it is more necessary for the pupil to study the character and temper of the master, than the master of his pupil ; for it is the mind of the pupil, and not of the master, which is to be formed.

Notwithstanding what I have said above does not cast any disparagement upon the opposite system, when the two systems are used in conjunction. Every individual possessed of a will ought to have a certain amount of indulgence conceded to that individual in every age and condition of life. All the happiness of human life consists in obeying our will. This obedience without doubt frequently leads us by our own ignorance and perversity into very great misfortunes, but these were unforeseen at the commencement of the voluntary movement. A child being destitute of experience, requires more frequent opposition to his voluntary movements than an adult ; but his ignorance and inexperience of the evils of life only teach us to place him frequently in circumstances where he may indulge his own will to the utmost extent without doing any injury to himself or others, and not altogether to deprive him of the pleasure of voluntary action.

These two systems of voluntary action are, after all, nothing but our positive and negative system of Nature. You may call which you will the positive ; they are both positive in one sense, and negative in another. But by whatever names you designate them, it is still true that both modes of discipline are useful, and that the exclusive adoption of one or other system would be an act of folly on the part of the teacher, and destructive to the temper and morals of his pupils. They are nothing else but the incorporation of the two great universal principles.

ples of law and liberty, each of which is essential to the happiness of public and private life, and human wisdom ought only to be exercised in the attempt to determine a just proportion between them, and not to elevate one as the superior of the other.

The indulgent system, which is now the order of the day, is most probably an extravagance on one side of the question, which experience will cure by repeated disappointments, and the result will be an intermediate course composed of the severities and restrictions of law, and the indulgencies of liberty. We cannot alter nature, or dispense with any of the ingredients of society or humanity. We can only effect new compounds. TOTUS.

PROPHECYING.

PROPHECY divides itself into a great many subdivisions; such as presentiments or forebodings; dreams; visions; auricular communications; scientific and logical calculations, &c. But in all of its departments the same universal law which our doctrine reveals always manifests itself, namely, the mixture of the good and the evil, the true and the false. With respect to auricular communications, dreams, and visions, much infidelity prevails in the world; but nothing of individual experience can be more certain, than that in this way many striking predictions of future events have been made. We ourselves have been witnesses to several; and the countless testimonies of the most respectable witnesses in all ages and countries compel us, in the spirit of charity, to receive them as facts; nor can the obstinate credulity of those who reject them ever pretend to the virtue of liberality. The liberality of this pseudo-philosophic age is only liberality in embryo, not yet quickened, far less brought forth. Notwithstanding, we consider that it is of the utmost importance to our character, that the reader should understand that in all cases this gift of prophecy is more an evil than a good, and is by no means to be coveted. It is a species of disease, because it is not the usual or common life of humanity. It is neither unnatural nor preternatural, but an exception to the every-day condition of terrestrial beings, whose reason should be disturbed and suspended by much intercourse with the spiritual world. Consequently, it is principally to fools, or very simple and ignorant and narrow-minded people, that such a gift of prescience belongs. In our eyes, there is no dignity in the character of a prophet. Some few exceptions there have been to this sweeping denunciation, but we are thoroughly convinced that they have in general been and still are simpletons. We do not except the prophets of the Bible, who are merely specimens of the whole family of seers, which still exists amongst every people. In times of great political agitation these characters are more numerous, and their faculties more remarkably developed; hence arose the singular instances of prophecy which appeared in France at the time of the French revolution, even in the midst of the most determined incredulity; which now, when recorded, make as little impression on the minds of the prepossessed unbelievers, as the opinions of Voltaire, Diderot, and D'Holbach, upon the mind of a Christian. Probably the whole

history of prophecy, even of Jewish prophecy itself, does not furnish more wonderful examples than those of the French prophet Cazotte, a man intimately known to the nobility and literati of the age, though rather retired in his habits, on account of his opposition to the prevailing spirit of his times. Having escaped from the Abbey on the 2nd of September, 1792, a friend congratulated him on his liberty. Cazotte replied, "In three days I shall be guillotined." He then related the vision on the authority of which he spoke, and it was literally accomplished.

We have before us a work of Doctor Johann Heinrich Jung-Stilling, late professor of the universities of Heidelberg and Marburg, and private aulic counsellor to the Grand Duke of Baden, on the subject of Psychology, translated by Samuel Jackson, 1834, in which the author takes a very different view of the subject of the spiritual world from Dr. Hibbert, in his *Philosophy of Apparitions*, as he calls it, although in our estimation one of the most unphilosophical books that a man of liberal education could have the hardihood to publish. Dr. Jung has certainly some dark and gloomy undefined notions upon the subject of which he treats, and is under the influence of a faith which has much to learn before it can lay claim to the epithets of liberal and charitable; but his frank and open reception of the testimony of humanity at large upon an important and curious class of phenomena, and the zeal with which he seems to have prosecuted the study of the subject, entitle him to our esteem, in spite of the confined views which he has upon some points of doctrine, such as the fall of man, redemption, and reprobation. We can forgive all these follies and puerilities, when we see a disposition to seek the truth, as it only can be found, by a free investigation of all the phenomena of individual experience, by which alone truth on any subject can be discovered. As for his conclusions, we let them pass; we only seek the premises, and these are the facts which he and a thousand others have brought to light; that it is not for want of sufficient testimony that infidelity, either church-going or church-deserting infidelity, refuses to credit the inter-communication of the spiritual and terrestrial worlds. But we don't mean to abuse infidelity, for we know it is leading to good results, though the principal of those results will be its own downfall, in company with that of old faith. We give the following specimen of the Professor's examples, because they are the least wonderful, as our readers in general have wider throats for the incredibles of materialism:—

"When a person resides for a while in the villages, amongst the lower orders, he will occasionally hear of some grave-digger, watchman, attendant upon the dead, nurse, &c., or of some one else, that can foresee funerals. This second-sight generally manifests itself as follows:—The individual feels himself impelled, generally in the night time, to go out towards the neighbourhood of the house, out of which the corpse is to be brought; he then sees the procession with all, even the minutest of its details. There is no doubt but that much dreaming and delusion is mingled with the matter, but the thing itself is correct, and is certainly true.

In my younger days, there was a dinner given in the

village where I was born, on the occasion of a baptism, to which the clergyman, a very worthy man, was invited. During dinner, the conversation turned upon the grave-digger of the place, who was well known, particularly on account of his second-sight, and even feared; for as often as he saw a corpse, he was always telling that there would be a funeral out of such and such a house. Now, as the event invariably took place, the inhabitants of the house he indicated were placed, by the man's tale, in the greatest dilemma and anxiety, particularly if there was any one in the house who was ill or sickly, whose death might probably be hastened if the prediction were not concealed from him, which, however, generally took place.

This man's prophecies were an abomination to the clergyman. He forbade it, he scolded, but all to no purpose; for the poor dolt, although he was a drunkard, and a man of low and vulgar sentiments, believed firmly that it was a prophetic gift of God, and that he must make it known, in order that the people might still repent. At length, as all reproof was in vain, the clergyman gave him notice, that if he announced one funeral more, he should be deprived of his place, and expelled the village. This availed, the grave-digger was silent from that time forwards. Half a year afterwards, in autumn, about the year 45 of the last century, the grave-digger comes to the clergyman, and says, "Sir, you have forbidden me to announce any more funerals, and I have not done so since, nor will I do so any more; but I must now tell you something that is particularly remarkable, that you may see that my second-sight is really true: in a few weeks a corpse will be brought up the meadow, which will be drawn on a sledge by an ox." The clergyman seemingly paid no attention to this, but listened to it with indifference, and replied, "Only go about your business, and leave off such superstitious follies; it is sinful to have any thing to do with them."

The thing, nevertheless, appeared extremely singular and remarkable to the clergyman; for in my country, a corpse being drawn on a sledge by an ox, is most disgraceful, because the bodies of those that commit suicide, and notorious malefactors, are thus drawn on sledges.

"Some weeks after, a strong body of Austrian troops passed through the village on their way to the Netherlands. Whilst resting there a day, the snow fell nearly three feet deep. At the same time a woman died in another village of the same parish. The military took away all the horses out of the country to drag their waggons: meanwhile the corpse laid there, no horses came back, the corpse began to putrify, the stench became intolerable; they were, therefore, obliged to make a virtue of necessity, to place the corpse upon a sledge, and harness an ox to it.

"In the mean time, the clergyman, and the schoolmaster with his scholars, proceeded to the entrance of the village, to meet the corpse; and as the funeral came along the meadow in this array, the grave-digger stepped up to the clergyman, pulled him by the gown, pointed with his finger to it, and said not a word.

"Such was the tale, with all its circumstances, as related by the clergyman. I was well acquainted with the good man; he was incapable of telling an untruth, much less in a matter which contradicted all his principles.

"Another history of this kind, for the truth of which I can vouch, was related to me by my late father, and his brother, both very pious men, and to whom it would have been impossible to have told a falsehood.

"Both of them had business, on one occasion, in the Westphalian province of Mark, when they were invited to dinner at the protestant preacher's. During the repast, the subject of second-sight was likewise brought upon the

carpet. The minister spoke of it with acrimony, because he had also a grave-digger, who was afflicted with that evil, he had often and repeatedly forbidden him from mentioning it, but all to no purpose.

"On one occasion, the prognosticator came to the minister, and said, "I have to tell you, Sir, that in a short time, there will be a funeral from your house, and you will have to follow the coffin before all the other funeral attendants." Terror, anger, and displeasure, got so much the better of the good pastor, that he drove the thoughtless fellow out of the door; for his wife was near her confinement: and notwithstanding every rational view which he took, he passed a very melancholy time of it, till at length his wife was safely delivered, and out of all danger. He now reproached the grave-digger most bitterly, and said, "See now, how unfounded thy reveries have been!" But the corpse-seer only smiled and said, "Sir, the matter is not yet finished."

"Immediately afterwards, the preacher's servant-maid died of an apoplexy. Now it is the custom there for the master of the house, on such occasions, immediately to follow the coffin, before the next relatives; but this time, the preacher endeavoured to avoid it, in order to confound the corpse-seer. He did not venture, however, to offend the parents of the deceased, which he would have done most grossly, if he followed the coffin. He found, therefore, a suitable excuse in the circumstance, that his wife, who, according to the custom prevalent there, was then to go to church for the first time after her confinement, should take his place, and he would then accompany the schoolmaster and his scholars, as was usual.

"This was discussed and agreed upon, and the parents were likewise satisfied with it. On the day when the funeral was to take place the company assembled at the parsonage. The coffin stood in the porch on a bier; the schoolmaster, with his scholars, stood in a circle in the front of the house and sang; the minister was just going out to his appointed place, his wife stepped behind the coffin, and the bearers laid hold of the bier, when that very moment, the minister's wife fell down in a fit. She was taken into a room, and brought again to herself, but she was so ill that she could not go to church, and the minister was so terrified by this accident, that it no longer occurred to him to make the grave-digger into a liar; but he stepped very quietly behind the coffin, as the prognosticator would have it.

The circumstance of the minister's wife falling into a fit, and its taking place just there and then, might proceed from very natural causes; but this does not detract from the remarkableness of the thing, the prediction was, at all events, punctually fulfilled.

"As the developed faculty of presentiment is a capability of experiencing the arrangements, which are made in the world of spirits, and executed in the visible world. second-sight certainly belongs also under this head. And as those that possess this capability are generally simple people, it again follows from hence, that a developed faculty of presentiment is by no means a quality, which belongs solely to devout and pious people, or that it should be regarded as a divine gift; I take it on the contrary, for a disease of the soul, which we ought rather to endeavour to heal than promote.

"He that has a natural disposition for it, and then fixes his imagination long and intensely, and therefore magically upon a certain object, may at length be able, with respect to this object, to foresee things which have reference to it. Grave-diggers, nurses, and such are employed to undress and shroud the dead, waitmen, and the like, are accustomed to be continually reflecting on

obj, as which stand in connexion with death and interment; what wonder, therefore, if the faculty of presentiment at length developes its: If on these subjects I am almost inclined to maintain, that it may be promoted by drinking ardent spirits.

"It is highly incumbent upon the police to forbid such people, upon pain of imprisonment, even to repeat what they have seen; and if it be of such a nature that it may be regarded as a providential warning, let them tell it only to him who is to be warned. It must, however, be well observed, that Providence will rarely make use of such corrupt and superstitious instruments."

We know we shall be reproached by some of the fools of modern liberalism for even publishing such things; for, like the Tories, they would put a stamp and a heavy tax upon every sort of knowledge but their own, in order to create an artificial state of intellectual being, which they are pleased to call rationality; but in this they show not a more liberal spirit than the German professor himself, who would subject the innocent seers and visionaries to the capricious power of an ignorant and arbitrary police authority. We shall never get truth till we have not only political but *moral* liberty. It is upon this principle of moral liberalism that we publish many things in which we do not literally concur; but we wish to give such indulgence to others as we should ourselves wish to receive. It is very true what Dr. Jung-Stilling says, that the chief reason of the great opposition to the evidence of such things by our modern philosophers, is, that, if they are found to be true, their philosophy falls to the ground. It must have a poor rickety foundation, if it cannot bear such a shock. As for superstition, it surely does not mean truth, but error, or the abuse of truth, and what is still more characteristic, the *fear of truth*. Who, then, we ask, are the most superstitious?

THE DOUBLE MENTAL NATURE.

The following is one of our friend G.'s highly mystical productions. We know that the greatest portion of our readers cannot understand his language, and we must confess that it is not a style of expression which we should adopt to instruct the public mind, because it is almost exclusively spiritual, and does not connect the two worlds of mind and matter, by employing the language of the latter. Notwithstanding, we can comprehend our friend, who is certainly one of the most enlightened and refined mystics we have ever met in our peregrinations through life; and in order to enable any of our readers who choose to peruse his article, to comprehend it also, we make one or two observations on the language.

In the first place, the words *time* and *eternity* are applied to the mind, to express two different states of intellectual or moral being. These two extremes exactly correspond with our double stage of progress, as taught by universalism. *Time* is the stage of individualism, error, disunion, sectarianism, and every attribute allied to these. *Eternity* is the stage of universalism, truth, union, &c., or the final stage of progress, to which the former leads. A *time-born* mind, therefore, is a mind which has limited and exclusive ideas of nature—a bigot; an *eternity-born* mind has unlimited universal views, and

is influenced by sentiments of unbounded liberality and charity, regarding God as the immediate cause of all the phenomena of nature.

The single birth and the double birth are perfectly analogous to the former; single is, in our language of universalism, indicative of sectarianism, bigotry, and narrow-minded views of God and his providence. The *single* mind can only see *one side* of a question; the *double* mind sees both, viz., the positive and the negative, the active and the passive, and can reconcile them both. Hence our friend says, "Man born into *time* is *singly* born, and he must be born into eternity doubly." The language is curious, but it is perfectly reconcileable with our universalism; and moreover, it is the production of a man of the most liberal sentiments. *Time*, according to our correspondent, corresponds to bondage; *eternity* to liberty; *time*, in fact, to every species of evil, mental and moral; *eternity* to every species of good; and the propriety of the application of the two terms is evident from the demonstration given elsewhere in the *Shepherd*, that evil is of a temporary nature; that good is always prevailing against it, and is the ultimate result; that evil destroys itself necessarily by its own divisions, and is therefore temporal; but good necessarily lasts for ever, by its own harmony, and consequently is eternal. Having made these few remarks, we consign the article to our readers' own contemplation.

THE DOUBLE MENTAL NATURE.

1. Mind is to be born man in eternity, and only when it is born man in eternity is it in the perfect progressive sphere, or double nature.
2. Mind, while born in time and is only a single truth, is imperfect, and will remain imperfect let it do what it will.
3. Do what we will with the single mind, in time it will become more and more imperfect.
4. Nothing but a birth in eternity will make mind double, and stop the single imperfection.
5. Man is born into time singly, and he must be born into eternity doubly.
6. Education cannot change a single birth into a double birth.
7. Civilization acting upon a time nature, cannot bring about an eternal nature.
8. Eternal consequences can only be brought about in a mind that is born out of time into eternity, out of a single state into a double state.
9. Man must be born again, born out of time into eternity, and only when he is born into eternity does he begin his double progression.
10. A time progression is not an eternal progression; as a time birth is not an eternal birth, or a double mental nature.
11. The first mental birth resides in time, and is single and changeable; the second mental birth inhabits eternity, and is double and permanently progressive.
12. Mind is really not man in time, but only when it is double born in eternity.
13. As man must be born out of time into eternity before he can begin his eternal progression, we must see how impossible it is for man in the time birth to reach that doubleness which belongs to his second mental nature, his birth in eternity.
14. A time mind, born in time, can only obey the time

laws; it cannot obey the eternal laws, till it is by a double birth born in eternity.

15. However imposing education and civilization may be, the time-born mind can assume no new distinction; it must follow the time laws.

16. The eternity-born mind can no more follow the time laws, than the time-born mind can follow the eternity laws.

17. That law into which a mind is born, it must follow, and this in conformity with the will of the original law maker.

18. The unity is the supreme one, the one on which the trinity in unity depends.

19. The time-born man does not possess a progressive power to advance to eternity, or to the perfection that is in the eternity.

20. However much the time-born man strives to improve himself, he is after all a time-born man, and his ends are in time.

21. The time-born man may imitate the eternity-born man, but it will always be for time ends.

22. The time-born mind, in striving to rise out of its sphere, sinks, and often debases itself below the brute.

23. The time-born mind, by the inordinate indulgence of sense, stops the second birth, or double mind, its eternal progression.

24. The time-born mind has no divine gifts, but only the shadows of those which belong to the double-born mind.

25. It is by the abusive use of these shadows that the time-born mind perverts its nature.

26. We cannot raise a time-born mind into the eternity, by all the art or artfulness that we can use, and this is fully exemplified in the present day by the highest and best educated minds.

27. A time-born man is a time-born man for all that is done for him.

28. Instinct obtains its end, and is an unerring guide in a time-born nature, and we shall see that this same instinct will act as perfectly in an eternity-born nature.

29. The time-born man, being born to serve a higher purpose, needs a guide; but the eternity-born man will be born double, and have a perfect law within him.

30. Whoever is not conscious of his own acts is a time-born man; who ever is conscious of all his acts, is an eternity-born man.

31. Sensation belongs to the time-born man; progressive consciousness to the eternity-born man.

32. The time-born man does not know right from wrong; he only can account for himself when he is an eternity-born man.

33. The single-born man exhibits merely the figure of a man; the real, true, spiritual man is the double-born man. He has thought, because he thinks from his double birth; his birth ground from the eternity, in the eternity, for the eternity causes and effects in one.

34. An eternal sensation is not born in time, but born in eternity; it is not material, but purely mental; not of the single mind, but of the double-born mind.

35. Eternal sensation, it must have been born out of time into eternity; out of singleness into doubleness, and be experienced in consciousness.

36. The mind, when it is born out of time into eternity, is born out of bondage into liberty; out of Egypt into Canaan; out of singleness in matter into doubleness in spirit.

37. Whatever is mental is spiritual, and must be born out of matter into spirit, or out of time into eternity, before it can progress perfectly in its double progression.

38. Every mental act that is enacted in spirit instead of in matter, is full of consciousness and perfect progressiveness.

39. Double mental representation in spirit, or in eternity, must not be confounded with single mental representation in matter or in time.

40. After this distinction of a mental birth in time, and a mental birth in eternity is clearly understood, the error of confounding the human birth with the divine birth, or the single mental birth with the double mental birth, must indeed be a willing blunder.

41. What must be incessantly insisted on, is a birth of mind from matter to spirit, if not an education or civilization of mind in and by matter.

42. Until mind be born from matter into spirit, there cannot be a double sensation in consciousness.

43. An eternal sensation in consciousness exceeds the power of the single mind born in time or matter; it belongs to the double mind, born in spirit.

44. As matter is born into instinct, instinct rules matter, and matter obeys it; so, when mind is again born into spirit, spirit will rule mind, and mind will obey it.

45. Spirit will be to mind, when mind is born into it, what instinct is to matter when matter is born into it.

46. As matter obeys instinct instinctively, so will mind when it is born into spirit and not into matter, obey spirit consciously.

47. Reason is the law of spirit in mind, when mind is born into spirit, as instinct is the law of spirit, when matter is born into it.

48. Reason is the law of spirit in mind, and instinct is the law of spirit in matter.

49. Reason must obey spirit in mind, as instinct obeys spirit in matter; and as matter yields to the instinct of spirit, so must mind yield in its second birth to the reason of spirit.

50. As matter will not yield to matter, but to the instinct of spirit, neither will mind yield to mind, but to the reason of spirit.

51. Every thought from the ground of spirit must be acknowledged by consciousness, and evinced by the mind syllogistically, or else it is not a pure rational thought.

52. The pure mind, born in eternity, acts doubly; a double principle, once evolved, is permanent, lasts for ever, and undergoes no change whatever.

53. The particles of matter are born, by spirit, under one universal law, called instinct.

54. The mind, being born into one universal reason, called charity, or reason, obeys through it the infinite spirit.

55. The first birth of the mind into the elementary particle of matter is not the effect of blind chance, but the design of a wise and beneficent creator.

56. And by the second birth of the mind into eternity, the spirit perfects its original intentions, or doubles the mental nature.

57. The mind consists of double principles, and has for its law pure reason, grounded in the infinite spirit; a body consists of elementary particles, and has for its law instinct, grounded in the same.

58. When the mind is born into eternity, and gifted with thought from it, then it will obey the spirit in all its movements, as the planets do the divine order.

59. When the mind is born out of time into eternity, then the order of the double mental nature is by the spirit restored.

60. The spirit only guides mind conditionally, while it is born into time condition; but as soon as mind is born into eternity, then spirit guides the mind fully.

61. It is the spirit that offers to the *heaven-born mind* the transcendent wonders of the splangled heavens, where the double science reigns in full perfection, and defies the puny efforts of the earth-born mind to approximate its matchless sublimity.

62. Spirit is known only by its double results in the regenerated or second-born mind.

63. The mind, until it be born again, is only a *crysalis*; is not a double being; is not able to account for any of its actions; it knows not right from wrong; only when double-born in eternity is it conscious of double sensations.

64. The double mind evinces an ultimate aim, which the single mind in matter does not, viz., an approximation to divinity.

65. The revealed word of God can be addressed only to the mind born in eternity; to the double-born mind, that can conceive the double meaning.

66. The double recipient mind must be first established, before it can receive the spirit.

67. The mind must be born in eternity before it can understand the divine word in its divine sense, or double meaning.

68. The mind born in time can only conceive effects, and must exclude causes; the mind born in eternity conceives the double principle, causes and effects, at once, as one.

69. Restore the double mental nature, and all the consequences will be double; by the double mental nature the predispositions stand in harmony.

70. By the double mental nature there is no need for the destruction of either end.

71. The single mind, born in time, has fully done its duty, by evincing on all occasions its total incapacity to understand the things of the spirit.

72. The double mind, born in eternity, understands the things of earth as well as the things of heaven.

73. The double mind powerfully confirms the Scriptures in their double character, and does not admit of any divarications.

THE SUPPOSED INFLUENCE OF THE MOON ON VEGETATION.

It is generally believed, says Arago, especially in the neighbourhood of Paris, that the Moon, in certain months, has a great influence on the phenomena of vegetation. The gardeners give the name of *red moon* (*lune rousse*) to the moon, which, beginning in April, becomes full either about the end of that month, or more usually in the course of May. In the months of April and May, the moon, according to them, exercises a pernicious influence on the young shoots of plants. They maintain that they have observed during the night, when the sky is clear, the leaves and buds exposed to this light, to become red, that is to say, to be frozen, although the thermometer in the free atmosphere stood several degrees above the freezing point. They also assert, that if the rays of the moon are intercepted by clouds, and thereby prevented from reaching the plants, the same effects do not take place, under circumstances perfectly similar in other respects with regard to temperature. These phenomena seem to indicate that the light of our satellite is endowed with a certain frigorific influence; yet, on directing the most powerful burning-glasses, or the largest reflectors towards the moon, and placing the most delicate thermometers in their foci, no effect has ever been observed which could justify so singular a conclusion.

Hence with philosophers the effects of the April moon are now referred to the class of vulgar prejudices, while the gardeners remain convinced of the accuracy of their observations. A beautiful discovery made some years ago by Dr. Wells, will enable us, I think, to reconcile two opinions in appearance so contradictory. No one had supposed, before Dr. Wells, that terrestrial substances, excepting in the case of a very rapid evaporation, may acquire during the night a different temperature from that of the surrounding air. This important fact is now well ascertained. On placing little masses of cotton, down, &c., in the open air, it is frequently observed that they acquire a temperature of six, seven, or even eight centigrade degrees below that of the surrounding atmosphere. The same is the case with vegetables. We cannot therefore judge of the degree of cold with which a plant is affected during the night, by the indications of a thermometer suspended in the free atmosphere: the plant may be strongly frozen, although the air remains constantly several degrees above the freezing point. These differences of temperature between solid bodies and the atmosphere only rise to six, seven, or eight degrees of the centesimal thermometer, when the sky is perfectly clear. If the sky is clouded they become insensible. Is it now necessary to point out the connexion between these phenomena, and the opinions of the country people regarding the April moon? In the nights of April and May, the temperature of the atmosphere is frequently only four, five, or six centigrade degrees above zero. When this happens, plants exposed to the light of the moon, that is to say, to a clear sky, may be frozen, notwithstanding the indications of the thermometer. If the moon, on the contrary, does not shine—in short, if the sky is cloudy, the temperature of the plants does not fall below that of the atmosphere; and they will consequently not be frozen, unless the thermometer indicates zero. It is, therefore, quite true, as the gardeners pretend, that under thermometrical circumstances precisely alike, a plant may be frozen or not, according as the moon may be visible or concealed behind clouds. If they are deceived, it is only in their conclusion in attributing the effect to the light of the moon. The moon's light is, in this case, only the index of a clear atmosphere; it is only in consequence of the clearness of the sky that the nocturnal congelation of plants takes place, the moon contributes to the effect in no way whatever; although she were hid under the horizon, the effect would be the same.—*Jameson's Journal*.

TO CORRESPONDENTS.

We have received Phillip Wood's communications, but they are like the wind-blown leaves of the sibyl, very hard to put together. His religious opinions are evidently not suited for the *Shepherd*, they would do better for some more orthodox periodical, and what he says of Astrology is very disconnected; but we shall examine them farther before next week.

NOTICE.

Mr. Saull delivers a Lecture on Geology to the Society for the Acquisition of Useful Knowledge, at 18, Store-street, Bedford-square, on Tuesday next, at eight o'clock in the evening.

Printed and published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 179, Livery-street, Birmingham; Heywood, Manchester; Reid, Tringate, Glasgow; Featherstone, Exeter; Yates, Coventry; Baker, Sidbury, Worcester; Brady, Sheffield; Tinker, Huddersfield; and all Booksellers.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 50.]

SATURDAY, AUGUST 8, 1835.

[Price 1d.]

THE CONSUMMATION.

As this is the very last article which we mean to give in the *Shepherd*, previous to the synopsis which we promised our readers, we shall endeavour to employ our graphic powers in delineating the model of an ecclesiastical establishment, founded upon the principles which we have advocated from the beginning of our little yearling. It is very probable that those who fail to understand the metaphysical discussions of the principles, may be able to form some idea of the true church of God, and of Christ, and of Nature, by a simple description.

It necessarily follows, according to our whole system of philosophy from the beginning, that there are two modes of forming an ecclesiastical establishment, or church, upon universal principles; one of these is the negative and the other is the positive. And we hope the reader is so far initiated into the philosophy of the doctrine as instantly to exclaim, "and both systems are equally necessary; they can no more subsist alone than man without woman, or woman without man." We can never resist such an argument as this. Whenever we shrink from our bipolar system we are apostates to the cause of universal faith and philosophy.

Now those two systems of universalism are extremely like each other, so like, that the greater proportion, nay, almost all of the infant and stripling liberals of the age, cannot perceive the difference, and until their minds have arrived to some degree of puberty it is in vain to attempt to explain it to them—it is a difference to be felt and experienced.

A universal church founded upon negative principles has very frequently been portrayed by moralists of different ages, but by none more frequently nor more beautifully than by those of the present age. Our social politicians and moralists of the freethinking, liberal, or infidel school, have given us many rich and beautiful descriptions of a state of moral perfection, constituted upon the principle of morality alone, to the entire exclusion of faith, or any other theological doctrine. Some have gone so far as even to banish entirely from the mind the idea of a supreme and universal spirit or uniting intelligence for universal nature; others are content with the nominal acknowledgment of such a universal mind, but insist upon an entire negation of all personal homage or worship in reference to such a being, and also upon a system of philosophy which excludes the idea of a superintending mind, by referring all the phenomena of nature to the blind and unmeaning laws of dead matter. There is no difference between these two in reality, they are

both positively (though one is nominally not) atheistical.

Yet they have drawn out the most exquisite models of a church as it ought to be, so perfect, that there seems to be nothing a-wanting to complete the model. It is like the picture of a beautiful woman, combining all the charms which nature has encircled within the limits of the female form, and presenting to the eye a finished portrait of a production to which nothing could be added to amend or improve it. The only fault it has (and that is not a fault but a merit) is that it is not male. So say we of all the social and moral systems of modern liberals. The next generation will much better understand our meaning. It is only the bitter experience of disappointment that can teach the negative party the truth. They will at length discover the important and searching secret that it is "not good to be alone."

One of the finest portraits of such a church as we now speak of is to be found in the article on Church Reform, in the last number (No. 2,) of the *London Review*. We do not mean to affirm that the writer himself is negative in his universal views, because good policy required that in such a production the negative style of expression should be religiously followed. We speak of the article alone, which we perused from beginning to end with the most intense pleasure. It draws a chaste and richly-coloured picture of a universal church, constituted upon the principles of social morality, yet taking under its protection every species of political or scientific knowledge which is of importance in promoting the progress of the human intellect, and enhancing the beauty of the human character; a church which dispenses with the dogmas of sectarian and antiquated creeds, calmly and dispassionately lays them all upon the shelf as interminable subjects of horrid strife, which only tend to disturb the repose of political and social life, without making any atonement for the mischief done, by the production of any species of public or private happiness; a church which employs the day of rest in furnishing the people with every variety of useful knowledge, as well as moral instruction; which dispenses entirely with formal prayer and formal thanksgiving to God, and pours out the feelings of a grateful heart in interchanges of reciprocal kindness, friendship, and love, and the innocent pastimes of a contented and disburdened mind, whose wealth is the possession of a healthy body and a just distribution of the produce of human labour, by an equitable system of paternal government.

Such a church would entirely forego the performance of such rites and ceremonies as now excite the contempt, and the prejudices of others,, by anything exclusive

or illiberal in their purport and interpretation, and regard nothing as either repulsive, immoral, or profane, which had not a direct or indirect tendency to diminish the amount of public and private enjoyment, whilst, on the contrary, every species of conduct whose tendency was to increase that amount, would be ranked amongst the virtues, in spite of any inspired command, or the evidence of any species of revealed mystery, however direct from heaven, to the contrary. In fine, it would be a church in which man would act as a rational, self-judging, self-determining adult, who regulated his own conduct by the circumstances of his political and social condition, without regard to the imagined will of any other being than those which are visible and palpable to his own senses, and evidently affected with pain or pleasure by his individual conduct; a church without the display of formal ceremonious worship, and one which never employed the argument of the will or displeasure of God as a motive to human conduct, yet still a church which inculcated every species of scientific and moral instruction, as far as the demonstration and experience of man could proceed.

This is the description of a perfect church; we have no objection to it. All its features are beautiful, and all its characteristics perfectly indispensable for the establishment of peace on earth. It is the consummation to which society must come, and to which it is fast approaching by the increasing disrespect which the public mind is evincing for every ostentatious or outward display of what has hitherto been called religion. True religion is like love. It is a secret; a secret which ought never to be divulged by any display, either in dalliance, or endearing language, or caresses of any kind, before a third party. A refined taste does not need to be taught this lesson of polished nature; it feels it; it practises it instinctively, and however enraptured with the object of its affections, it never betrays its own inward emotions, except in the inscrutable secrecy of double solitude. It would consider itself as committing a species of sacrilege, of disgusting licentiousness and brutality, by public indulgence. It will yet be so with religion, which demands equal secrecy, for it is the *love of God*; a love with which no third party can sympathize. The only religion which ought to be expressed or outwardly manifested is that of our duty to one another. There is no other way of being socially religious, but by outward practice or morality. The mere feeling of love to one another is nothing unless it be manifested in the conduct; but the mere feeling of love to God is every thing; and the outward expression is a pompous display, which only tends to generate unsocial regards in mankind towards one another; because it goes upon the mischievous assumption that the Deity is partial to certain formulæ of service, and pleased, like man, by verbal flattery and bodily prostration. It is the character of a high-minded and generous man to despise such humiliation in those who are subject to his authority, and shall God be delineated as less noble, less generous than one of his own paltry creatures? Our ideas of God progress with our minds. The God of the long-promised millennium is a very different God from him of the old world, because the mind of man in whom the

idea of God is conceived has undergone a radical change.

Hitherto we have been delineating the outline of a universal church in what we call the negative sense; and our readers may observe that we have given our unqualified approbation to this negative church. Notwithstanding, it is not positive, and therefore never can possibly succeed alone. It wants an individuality, a unity, an activity, a stability which one idea only can infuse into it. The form is perfect; it is beautiful, it is virtuous, it is wise, but it is *negative*. Why is it negative? Because it does not act upon the positive basis of universal Nature being all conducted by one all-pervading, all-performing sentient intelligence, who has brought every thing into being for a specific purpose; not accidentally, not involuntarily, not unintentionally, not permissively, but designedly, in the most unlimited sense of the word *design*. This idea will not alter the constitution of the universal church; it will produce no effect on the forms, ceremonies or outward character, but it will perfect it, by infusing into it, what it did not previously possess, a unity, a consistency, a power, a security, a purpose, of which it, before this new infusion, had no symptoms.

This is all the difference between the two species of a universal church; but the peculiarities of both are useful and necessary notwithstanding.

In the first place, the peculiarities of the negative principle are necessary to further the progress of science in the investigation and discovery of proximate causes, which are only to be found by entirely overlooking the idea of a first cause. There was a time when men were content to satisfy their ignorance of secondary or proximate causes, by referring every phenomena which they could not understand to the immediate operation of God. The effects of this universal habit of barbarian philosophy are still visible in some of the daily practices of our judicial government. Thus, when a coroner's jury cannot discover the proximate cause of the death of the subject, they return a verdict of "Died by the visitation of God." If poison be discovered in the stomach, then God is supposed to have no hand in the murder; or if any mortal wound has been inflicted, God is not mentioned. It is only when no other assassin can be discovered by the jury that they lay the blame upon God, and even then they do it very delicately, by calling the murder a "visitation." A more perfect system of religion would teach us that all events are from God immediately, of whatever character they be. Notwithstanding, it is necessary for the very existence of science, that the universal cause, God, be kept entirely out of sight in analyzing the material world, because it is necessary for the advancement of human knowledge that proximate, secondary, or minor causes, be discovered, as being the only causes which man can employ to any practical purpose. What would be the use of telling a child that thunder is the voice of God, or that God makes iron, oil, and gun. The word God is a universal idea, which comprehends all causes, but gives the enquiring mind an idea of none. It is of no use in the acquisition of scientific knowledge. So far, therefore, from the negative system being a useless system, it is the most practical of the two. It is the real

productive system; the Eve which brings forth knowledge, by refusing to obey the equivocal voice which forbade.

The positive system employs the word *God* as the great uniting principle which combines in one all those proximate, secondary, minor, and disconnected causes which the negative system pursues. It gives a unity to all this multifarious scene of nature, which science examines in detail. It views the whole with the bird's-eye prospect of a generalizing mind, and by the help of those discoveries which the negative system brings to light, it dives into the plans and mysteries of universal nature, revels in the sublime and intellectual contemplations of its unique intelligence, and anticipates the future destiny of man from an analysis of the present and the past, and the analogy of the whole and its parts. Moreover, there is this peculiarity about the positive system, that it connects the whole history of the species by one great intellectual link of conscious purpose. It rejects the unphilosophical and absurd idea of chance, or incidental occurrences, by including all systems of religion and politics within the machinery of nature, not as fortunate or unfortunate coincidences having a passive origin, which is a most insane idea, but as movements originating in an active will.

But what is the use of both these systems? and is not the one better than the other? They are equal: but it is evident that their departments are different? The negative is the scientific department, the department of production, like the female; it brings forth the sciences; it brings into being all the details of knowledge. Its utility is therefore undisputed. The positive is, properly speaking, the religious department, on account of its uniting and generalizing character. It gives consistency, unity, and harmony to the ideas which the other creates, without which they would be an atmosphere of dust, under the superintendence of a whirlwind.

To want either of these two sexual characters would be a fearful imperfection in any system of religion. Hitherto the church has been defective in both. It has neither generalized sufficiently, by reducing the universe to an harmonious whole, nor has it cultivated the subordinate sciences, by making them the subjects of popular instruction. And infidelity has erred, on the contrary side, by collecting isolated facts of partial interest, and refusing to connect the whole together by the idea of an intelligent mind. Thus both parties are decidedly imperfect, yet both holding a principle of truth; which two principles of truth make up its sexual character, and form the foundation of that double system of ecclesiastical nature of which we have been treating, a double nature which cannot be discovered without the entire destruction of the whole as an instrument of conciliating the contradictory spirits of men.

We therefore, notwithstanding all we have said against it, embrace the spirit of infidelity. Is it sufficiently liberal and enlightened to embrace ours? Then let a marriage take place, as a type and earnest of the great consummation of the progress of humanity in knowledge and religion.

THE SHEPHERD.

HOMŒOPATHIC TREATMENT.

Omnia patefacienda, ut ne quid omnino quod venditor nescit, emptor ignoret.

TULL.

We will tell our readers fairly what we know, that they may not be ignorant of the nature of our drugs.

I HAVE traced with a few strokes a short outline of the homœopathic system. Our readers know that the two fundamental principles of this new doctrine are, first, that homogeneous remedies cure homogeneous diseases; second, that homogeneous remedies act only beneficially when their doses, reduced to a quantitative minimum, are extended or dilated to the highest possible degree.

But how do we get the knowledge that a remedy is homogeneous to a certain disease? and how can we reduce a drug to that infinite small part capable to remove the disease, without causing any injury to the human frame? Before answering this question, I must remind my readers that, in the medical art as well as in all other sciences, those who have assumed to be the leaders of the people have been, for the most part, word-mongers.

It was in vain that Lord Bacon gave the golden precept—"That it is useless to expect any thing like a true increase of knowledge by mixing up new facts with old errors; that we must go back to the first principles, and sift them conscientiously, in order to obtain that true and active natural philosophy, which may serve as the basis of the medical science." With few exceptions, the errors which prevailed at the times of Dioscorides continue still to frustrate the useful discoveries of our more enlightened century.

The principal error is the fiction that such or such a drug is possessed of some general medical property. I have now before my eyes several of the most esteemed *materia medica*, that is, the natural history of the substances employed in medicine, and I find them teeming with broad assertions which are, for the most part, idle and void of truth.

The most heterogeneous substances are classed under the name of antispasmodic, anodyne, strengthening, evacuating, diuretic, febrifuge, and the like. Yet when we examine the mode in which such drugs are administered, we find that the imagination of the doctor has attributed to a favourite remedy, the proclaimed quality, at the same time that he mixed up with them other remedies, which, each in their kind, could produce similar or different results. These different drugs are acting, according to his fancy, a particular part, with the same passive obedience as if they were drilled into military discipline. Each, according to their imagined faculty, bears a proper name; the one is called the active ingredient; the second is the (*adjuvans*) auxiliary; the fourth, the receiving, and so forth.

The second error is, to have imagined general names of diseases, which, each in their kind, are different, and which, almost in every individual, are differently shaped. Such names as fever, fits, cardialgy, epilepsy, and the like, are like the letters in algebra, signs which denote ever-changing and imaginary entities, often nonentities.

The homœopathy had nothing to do either with the imaginary general qualities of the remedies, nor with the

imaginary names given to diseases. It does not deal with compound recipes, nor does it trust in any experiment but that which is made upon the living healthy body. The homœopathist knows, that all experience has been hitherto a self-delusion of the medical practitioner. I have before me a series of numbers of the *Lancet* and of the *Medical Journal*; a physician prescribes within twenty-four hours, digitalis, opium, and bleeding; the man is dismissed as cured from the hospital, after having been submitted several days to the same treatment. I ask, whether any sound logical deduction can be made from this experience.

Another doctor vaunts of blood-letting to exhaustion in the hydrophobia, and yet the patient was taking an enema of laudanum, and strong mercurial frictions. A woman was dismissed as cured from rheumatic pains from one of the hospitals, under the supposition of her being cured by the hydrodate of potass; yet the iodine, and the oleum croton were applied externally.

A man was lately treated for a disease called by the doctor, intense purpura hemorrhagica; zinc, ointment, beef-tea, three eggs a day, nitrate and carbonate of soda, of each fifteen grains every three hours, were employed simultaneously, besides as much white wine as the patient liked. He died. Did this man die of natural death? What experience can be gathered from such scientific mystifications?

The method employed by Hahnemann and his followers in ascertaining the power of a drug is to make the experiment upon oneself, by taking a minute dose of it, and observing the symptoms which it produces. When these symptoms are perfectly known, and a sick person comes before the doctor with symptoms similar to those which the known drug produces in the healthy individual, such drug is the specific remedy for the individual case.

Thus the most minute particles of belladonna having produced upon the healthy persons symptoms similar to the scarlatina, the dilution of this herb is a specific against this disease; the wolfsbane produces symptoms similar to those experienced by people attacked with the puerperal malaria, and this herb is also a certain cure for the disease.

The extract of *thuya occidentalis* produces warts and other symptoms similar to the sycosis, consequently it is in its diluted state a safe remedy against a disease which formerly was treated by caustics and surgical operations.

The way of reducing the homœopathic remedies to that minimum of weight and maximum of expansion or dilation, is very ingenious. It will not suit our chemists, because it requires too much time and care, but will be found useful to every one who will become a true benefactor to his fellow creatures.

We take a grain of mercury, or a drop of cajeput oil, and put it with thirty-three grains of milk sugar in a mortar of china; the two drugs are mixed with a spatula for six minutes, afterwards it is worked with the pestle for a few minutes longer; thirty-three grains of sugar of milk are added to it, and the operation with the spatula and the pestle are renewed for the same time, and the same is done with thirty-four additional grains of sugar of milk; so that we obtain a mass, which is

preserved in a phial, and signed 1-100. One grain of this powder, worked in the same way with a hundred additional grains of sugar, gives the 1-100,000, and by acting in the same way progressively, we obtain the millionth and the billionth.

With a grain of each of these powders, mixed with a hundred minims of alcohol, the analogous tinctures are obtained.

A single drop of one of these tinctures reduced to a 1-1,000,000, is often sufficient to cure a disease.

Some substances, for instance, camphor, are diluted in alcohol, one grain in one hundred minims, and the smallest part of a drop is taken on sugar. What difference between this our method and the endless potions of our practitioners! THE ALPINE PHILOSOPHER.

THE AERIAL SHIP.

WE visited this new inhabitant of the firmament on Monday last, but we were astonished to find that all the newspaper reports we had seen had given a false account of it. We never for a moment doubted that it was intended to bid defiance to the wind, by moving right against it; but the proprietor, when we made the remark, exclaimed, "No such thing; not at all; we go with the wind." The principal peculiarity of the Aerial Ship is not the wings, which are of no particular use, except in a calm; but the internal air-balloon, an imitation of the air-bladder of the fish, by means of which the vessel is lowered or raised at the pleasure of the conductors, to meet the different currents of air which move in the atmosphere. It is well known that the air contains different strata of moving streams, which often go in contrary directions. By rising or falling into these streams, the projectors expect to regulate their course in any direction. This they accomplish by means of the air-bladder, which is inflated with common air, by means of an air-pump, whenever they want to descend; this diminishes the volume of the gas by compression, and consequently makes it specifically heavier. In order to rise again the valve is opened, and the gas of the balloon immediately empties the air-bladder by pressure, and the balloon becomes specifically lighter. By this process no ballast is required; they make their own ballast.

The wings are ingeniously contrived upon the same principle as the valves of the blood-vessels; so that they open to the wind in one direction, and shut in another; but they are evidently too small and weak to produce any effect upon the stupendous body of the flying dragon itself. We may judge of the force of wing required for flight, by the wing of a bird, which is the strongest part of its body, and considerably longer and broader than the whole body itself. The wing of an eagle will knock a man down, and, stretched out, the two wings measure twice the length of the eagle's entire body, at the very least; but the wings of the Aerial ship are not even one-half of its breadth in length, and by far too feeble to make the slightest impression on any of its movements. The projector modestly says they will be of use in a calm, and so we think, but he makes no higher pretensions than this, only the stamped press has made these pretensions for him, by way of showing its own critical skill in condemning the whole as a hoax on John Bull. Such attempts as this ought to receive every encouragement from the public; they are the incipient art of aerial navigation; an art which our posterity will bring to perfection upon the basis of their fathers' instruction.

PHILLIPS'S APHORISMS.

Sir Richard Phillips has published a legacy to philosophers, in a hundred Aphorisms or articles, containing the elementary principles of natural science. We are very much disappointed in this little book, not because we paid a large price for it—though that is one considerable objection—but because it is really less logical and less accurate in analyses and definitions than the loud pretensions of the author to superior sagacity led us to expect. Sir Richard is a Liberal of the first water; a huge enemy to Newtonian philosophy, and every species of priesthood and religion, and has laboured hard for many years past to simplify to the comprehension of the human mind the whole process of Nature's movements by means of atoms, and their power of motion. Not even the formation of an animal seems to be a mystery. Nature first makes polypi, or live stomachs, without consciousness, but with a species of indefinable sensation; then she proceeds to make *feelers, muscles, bones, brains, &c.*, and then it is all over; and she herself never wonders at nor admires her own handicraft, because she has not the sense to admire or wonder. The ascending scale of creation, however, between a polypus and a man, is, after all not a little puzzling to Sir Richard's school; for how did she ever take such a leap as to span the wide chasm which separates the bodily frames of a horse and a man? It must have cost her an amazing effort to bring the human being into existence, even when she had attained to the perfection of a horse manufactory, or the formation of dolphins and cod-fish. Some link between the two opposing species seems to be a-wanting to serve as a bridge for Mother Nature to walk upon. This difficulty Sir Richard gets over in the following curious manner:—"The sphynx (half man, half lion), the satyr (man monkey), the centaur (man horse), the unicorn, hypogriff (horse bird) the mermaid (woman fish), hydra, dragon, griffin, &c., are now believed to have been poetical creations of the ancients, though so gravely described by many authors, and introduced as fact on the celestial globe, in a series of real animals. *If admitted they would fill up links in the superior species, and remove some difficulties.*" What a pity Sir Richard has not got a little more faith. Nature would then become more intelligible to him, according to his own acknowledgement. Superstition is not always absurd, since it even helps to remove the difficulties of men of science.

But let us come to the Aphorisms. We shall give the two first just as we find them:—

"As animal senses and perceptions take cognizance only of matter, or body, so the varieties of matter as presented to the senses in all relations, are the sole instruments of sensible phenomena, and the sole subjects of philosophical investigation."

This may be all perfectly correct, as Sir Richard understands it, but it is most indefinite and equivocal. Varieties of matter, the sole subjects of philosophical investigation? Why, properly speaking, it is not matter, but the *qualities* of matter, that are the subjects of philosophical investigation. It is sourness, sweetness, hardness, softness, durability, penetrability, malleability, fusibility, &c., which are the subjects of investigation, and these are purely spiritual, and not *varieties* but *qualities* of matter. If, however, he allows the spirituality of matter, his aphorism is perfectly correct; but it won't do for an aphorism without some comment. But the second is worse and worse.

"Power, called also momentum and force, is the *display* of some matter in some motion, or of the transfer of some motion of one body to another body *ad infinitum*."

This is logical insanity. Power is *display*. Display is an effect, and power is a cause. He has jumped from the positive into the negative with one furious bewildering leap, and confounded the two extremes of Nature together. Power makes a display; but it is not display itself; it is the cause of the display.

This negative word, motion, is the God of the atheist. He dares not employ a positive term; and even when he defines the positive word power, he uses a negative to make a definition.

Aphorism 17th: "Motion is the animating and pervading soul of the universe."

It is the maternal, but not the paternal soul, Mr. Negative.

18th. "In searching the causes of the phenomena of the heavenly bodies, which phenomena are mere changes of relative position by motion, we are under the necessity of regarding the *causes* as motion, and as motion so transferred by Sublime and Omniscient Mechanism, &c." Here is almost a positive idea at last: we did not expect so much. Then the cause is not motion, but this sublime and omniscient mechanism. But this omniscient mechanism is a negative, after all. Mechanism is an effect, not a cause. Omniscient gives the idea of infinite intelligence, and is so far good; but mechanism is a purely negative term; perfectly correct, however, as applied to nature, if the author means to include the positive idea of mechanist at the same time.

This is found at last in the 100th aphorism, that is, the last; and we are much gratified with the sight of it, and congratulate Sir Richard on the good sense and sound philosophy which inspired him.

"Motions of matter subject to regular mechanical laws, acting absolutely or subordinately, generally or locally, on aggregates or atoms, and producing various densities, and different degrees of locomotion and re-actions in atoms of matter, of different constitutional forms, are the *proximate* causes of all phenomena; and as one series depends on another, so all existing phenomena are, in regard to others, physically fit, compatible, and harmonious; and as matter cannot originate its own motion, so, in considering motion as the proximate cause of all phenomena, we arrive, through an ascending series, at a mover which is not moved, in the necessary, omniscient, and sublime *FIRST CAUSE* of all motion, and consequently of all phenomena."

We must confess we were not prepared to expect such sound philosophy from Sir Richard. We looked for nothing but a purely negative philosophy; a mere motion, without the slightest idea or hint of an intelligent mover. Our disappointment is therefore an agreeable one, which has afforded as great pleasure to our minds as it must cause displeasure and chagrin to the minds of those who had previously regarded Sir Richard as a zealous disciple of the school of atheism. It will no doubt be affirmed by many of his atheistic friends, that this last article, which is the only one of the hundred which makes a definite allusion to a *positive* first cause, is merely a piece of condescension to the prejudices and superstition of the public. This, however, to say the least of it, is an insult to the author, and a most uncharitable construction put upon his motives, as well as a libel upon his character for sincerity and veracity. We shall take him at his word; and now challenge him, or any other person in his name, to bring forth one single plausible or rational objection against the direct and immediate inspiration and divinity of religious systems. He is a professed infidel; the whole tenor of his philosophy is purely atheistic, everlastingly excluding the idea of design from the

operations of nature. Yet here at last, in his legacy to philosophers, he acknowledges that *all the movements of nature* are merely the operations of an OMNISCIENT FIRST CAUSE. Is Christianity one of those movements of nature?—was Jesus Christ's mission and doctrine one of those movements of nature?—was Mahomet's mission one of those movements of nature? They were, and therefore they were the works of an omniscient first cause, and parts, also, according to aphorism 18th, of an omniscient mechanism. We want no more to demonstrate our universalism. These consequences Sir Richard does not foresee, because the philosophy and theology of the age never led men to this view of nature. We are the first, the very first, in the field of theological science, to bring the subject before mankind in a determinate manner.

There are many of the aphorisms of Sir Richard to which we cannot make the slightest allusion, because they require more knowledge of mathematical calculus to understand them than is ever possessed by the general reader, and therefore they rather exceed the limits of simplicity, which we originally prescribed for our little periodical. We shall, therefore, only notice one or two which have a direct and immediate bearing upon the general views of Nature which we have presented to our readers. In Aphorism 72, we have the positive and negative laws of nature thus expressed in reference to Electricity:—

“Electrical phenomena, abstractedly considered, are examples of atomic action and reaction equal and contrary; for there is no positive effect without equal negative, and there is no absolute single electricity in any body or space; but correlatively and simultaneously equally positive and equally negative, or equal action and reaction; and then the mutual energies of the two, and their entire or partial reunion, constitute all the phenomena.”

We now come to the author's deep-rooted antipathy to the Newtonian attraction and gravitation, an antipathy which is out of the sphere of our sympathy or comprehension. Newton attached no importance to the words attraction or gravitation; he thought them the best words which the language afforded, but did not consider himself responsible for lingual imperfections. Let us see if Sir Richard has mended the matter with his new nomenclature:—

“8. The gratuitous powers which were introduced into nature in dark ages, or in the infancy of philosophy, were attraction, or some sympathy of bodies by which they go together—*repulsion*, or some aversion by which they separate—*gravitation*, (a variety of attraction) by which bodies fall to the earth, and planetary systems are governed—*inertia*, by which matter is said to have a force of its own [rather no force of its own]. And then, following this bad example, the moderns have invented many others based on the names of effects.”

Now after this condemnation of such terms, observe what follows:—

78. “The pretended attractions in electricity are merely mechanical. Whenever electricity is displayed, the opposed surfaces *seek to reunite with force*.” Seek to reunite! But observe, they have no attraction for each other! “Then if any light body (which moves with less force than the force between the opposing surfaces) is placed on either surface, it is carried by the whole force to the other surface, and back again from this surface to the first, and so on; but these effects afford no proof of the absurd principle of mutual attraction.” It is merely a description of mutual attraction. You may

assert if you please that there is no attraction in love, that the parties only *seek to unite with force*, but will you convince a lover by this logical distinction that his mistress does not exercise an attractive influence over him?

Moreover, after objecting to the word repulsion, the author is actually obliged himself to employ it, to describe the effects produced in the action and reaction of nature:

79. “Bodies similarly electrified act *repellingly*, and those contrarily unite (*not attract*); so similar ends of magnets *repel*, and different ones unite.” Why repel, if there be no repulsion; and why not use the verb *attract* as well as the verb *repel*? Is it not quite as philosophical to suppose that objects attract, as that they repel each other?

Instead of attraction, Sir R. substitutes another equally indefinable nonentity called pressure, in whose behalf he is so very outrageous, that he brands the advocates of attraction most unmercifully, not with folly only, that were an innocent species of crime, but with knavery also. No doubt it was the priests who invented it for superstitious purposes!

96. “This interception or unequal division of a common pressure has been a fruitful source of philosophical imposture, and treated by *knaves and fools* as sensible attraction. Thus the interception of the atmospheric pressure by a mountain on a plummet, and of two poised balls as to each other, are put forward as formal proofs of the attraction of the earth and of matter on matter.”

There was no occasion for the old gentleman to be in such a passion in making his testament. His pressure is quite as good as attraction, because it is nothing else but attraction, a word which describes the phenomenon in a more expressive and concise manner than any other word which the language supplies. When we say that a magnet attracts a needle, we only maintain what is a sensible fact, that by some irresistible power the two bodies approach each other, but the smallest being most easily moved, is the only one which experiences a change of place; the needle attracts the magnet as much as the magnet the needle, but the word cannot apply with the same propriety to the needle, because the needle is negative by giving way, and “attract” is a positive active verb. Would it be an improvement in our mode of speech to say the needle is *pressed* towards the magnet? Would it convey more just ideas of nature, or remove a single erroneous unphilosophical conception? We trow not. Sir Richard's idea is, that equal portions of space have equal power, that is, less matter and more motion, or more matter and less motion, and any disturbance of this condition leads to reactions, called phenomena. This may be true enough, but it is not a whit less mysterious than attraction itself. What is space? and what is that substance which fills it, whose atoms are smaller than oxygen and hydrogen; does it consist of atoms at all? Is it not a spirit, one and indivisible? This is quite as comprehensible as a universe of dust. “Phenomena,” says Sir R., “indicate that atoms of oxygen and hydrogen are not the smallest in space.” There are other spirits besides bogles and kelpies.

Upon the whole, we question much if Sir R. will ever receive the thanks of any philosopher of this or any future age for the legacy he has bequeathed.

TO THE EDITOR OF THE SHEPHERD.

MY DEAR SHEPHERD,—Your resolution, as lately announced and confirmed, as to an early conclusion of your labours under that character, though a subject of deep

regret, affords a cheering prospect of that retirement, being only a transmigration of your spirit from religion into the region of politics; the former as the basis, the latter as the practical department.

The crook has accompanied the *spirit* of his Shepherd; long before its first appearance in that form having, as his forerunner in the wilderness, at a very humble distance, but, in a degree, prepared the way before him.

In the compilation of "the universal church," and in contemplation of "religious and civil union," he acknowledges the universality of the former, and upwards of a quarter of a century has not shaken his conviction of the principles being applicable to the latter.

"The universal church" of nature, from its commencement, acknowledged, "a primitive and general principle operating in two derivative or particular ones, corresponding with the "generic and specific" principles of "The New Moral World," and with your pastoral universality and twofold or duplex distinction in that most comprehensive union.

Your doubt as to the time for political universality may be well founded; but your admission that "the time will come," and that "both church and state are hastening rapidly towards it," affords hope that its progression may be more rapidly accelerated by circumstances than you might consider yourself justifiable in calculating on, in your communication with your flock.

The general, generic, or universal principle, though applicable to politics, may not excite that immediate interest which you deem your future exertions to require; but the duplex tendency seems now to be in full operation; yet, preparatory to popular excitement, it may be incumbent "to catch occurrences as they rise, if not to accompany them in their flight" for Albion, or your western extremity of progression, seems not only the most desirable locality for commencement, but for completion.

That the excitement of the public is usually more through their passions than their reason was manifest in their reception of the late Reform Bill, in its progress through its various stages, before its passing into an Act of Parliament, in the increasing clamour of its advocates for "the Bill, the whole Bill, and nothing but the Bill."

The Reform Act is at this moment in full and more than usual operation; but yet reason has not inculcated into its objects generally that the new franchise is only the liberty of purchasing their constituency at a much higher price than before, under the additional liability of losing their new right, through the intricacy of the duties required for their qualification, and its machinery in working, but what is worse, the ultimate loss of their ancient franchise, the scot and lot constituency, the best in principle, simple in operation, of much greater parochial advantage, and in every respect one of the most valuable of their political privileges.

In contradistinction both as to immediate effect and ultimate tendency, the Municipal Corporation Bill, by far the most prominent movement at present before the public, is, by a correspondent of yours, more appropriately designated "The Municipal Reform Bill." On enquiry after the principle of the Bill, it has been retorted, that no principle is to be seen; yet, if it be only in the extension of the scot and lot constituency, it would be invaluable; but whether with or without principle, the Bill has passed from the lower to the upper region of Parliament, and when farther refined, as it will probably be in passing the ordeal of opposition there; and when farther passed into an act, will operate in highly beneficial counteraction of the present Reform Act, by placing many constituents in a better state than they were in be-

fore the reform, and in enlightening others as to their true political interests; and these may be emphatically contemplated as a reform of the political reformation; yet there has been little or no popular clamour for the Bill—the whole Bill—and nothing but the Bill.

Scot and lot contribution are jointly defined as customary, and as imposed on all subjects, according to their abilities, which appear duplex.

Premising from generally acknowledged facts, that a great proportion of the inhabitants of this country are progressing towards the extremity of poverty, if not of riches, the scot and lot constituency seem, in the view here taken, admirably to apply—the former in the contribution of the rich toward the relief of the poor of the place from which the constituency is claimed—the latter in the liability of the constituent to stand the lot of serving in the militia, and on juries, or other local and political duties.

The contribution by scot, in money, as the representative of labour, seems to apply principally to the higher ranks; by lot, as the contribution of labour, seems generally more applicable to the lower grades of society.

In the representation of labour by riches, the actual source is not pretended to be described; but in imitation of a commentator of the laws of England, is rather the definition of a principle as it ought to operate.

"The voice of the people" is undoubtedly advantageous, even in support of hyperphysical and metaphysical doctrine, but specially requisite in carrying into effect political principles. But enough has been set forth in demonstration that the more valuable acquisitions are not received most clamorously; but the political department, as more physical, will be more tangible than the religious, and practice may be very consistently erected on your basis. Example will prove better, and will be the proper termination of your precept.

Permit the undersigned to follow the metaphorical character of his Shepherd, but, of course, under his general direction, as

2d Aug., 1835.

THE SHEPHERD'S CROOK.

ANTS.

THE ant-hills of our fields are full of cells and passages, curiously formed with twigs and weeds cemented by their own gluten. They disfigure a field, but do not diminish and rather increase its productiveness for grazing; and in grazing districts they abound, and are seldom disturbed. They present a larger surface to the air and increase the quantity of grass and animal food, while they fertilize the soil.

The nests of ants are managed by the neuters, and usually established in mole-hills or among the roots of trees. There are eighteen species, and they are remarkably intelligent, ingenious, and industrious. Nests often fight like men, and kill vast numbers of each other.

An ant's nest consists of males and of females, who have wings, and also of neuters. The females enjoy the same pre-eminence as among bees; but the manners of ants are more varied, and system, object, and end, mark all their varied reasonings and labours. They have long and tenacious memories, know each other, and distinguish any stranger. They carry on systematic wars, and practice all the arts of attack and defence. Man himself is not more savage in war: but they are citizen soldiers, and not hired and trained for butchery and murder. They also practice slavery, making slaves of those they overcome. They keep aphides, as men keep cows, for the juices which they yield. Their nests are formed at pleasure, and their cells of various forms. In Brazil

they are almost masters of the country, and in Africa not less formidable. The termites, white ants, or cutters, not only destroy furniture, clothes, &c., but raise conical buildings, nine or ten feet high, like villages, which it is inconvenient to approach.

M. Hanhert saw a regular engagement between two species of ants, in which they drew up in lines of battle, with reserves, &c. &c., and fought for four hours, taking prisoners, and removing the wounded, till victory decided for one party.—*A Million of Facts.*

WISE MEN GONE MAD.

THERE is evidently some new political earthquake about to take place in France, if the reports be correct which have lately arrived from that country. Louis Philippe is not to be deterred from acting the tyrant by the fatal experience of his predecessor. The same spirit of infatuation has already possessed him. He only sees one enemy in his dominions, and that enemy is the *Press*, the greatest and the best friend of the people and of the human mind. The whole blame of the infernal machine is to be visited upon newspapers and the editors. Measures of dreadful and most insufferable censorship are in contemplation. Not a word is to be spoken or written against the present government! It is to be criminal even to hint at the possibility of instituting a better system of politics, or amending the one in power! The legitimacy of the present family is not to be questioned! Every public writer calling himself a Carlist or a republican is to be accounted an offender against the state. Even caricatures are to be prohibited, as tending to throw contempt on the authorities of the state; and writing or making marks on the walls disrespectful to Government is equally treasonable. Every newspaper article is to have the writer's name attached to it, and what is still more intolerant and suspicious, every article is to be sent to the Procureur du Roi before it be published! This beats even the proposed censorship of Spain last year, which even in that barbarous and enslaved country could not be carried into effect. If Frenchmen bear this, their reputation is lost for ever. Our Whigs seem to be in league with the traitor king to crush the rising spirit of public intellect. Let them try. They are merely digging their own graves, or building their own cells, for they are certainly mad. We hope that Messrs. Hume, Roebuck, &c. will move the House for a grant of money to increase the size of Bedlam. The symptoms of insanity are at present very alarming amongst men in power; there seems to be a *revolution* in their brains, and as is usual with madmen, it is altogether in vain to attempt to reason them out of their hallucinations. Poor Philippe!! afraid of a half-penny caricature, stuck up in a bookseller's shop for the amusement of school boys and boarding-school girls! Poor Philippe!! Why should he be afraid of the exercise of human reason, if he be not himself bereft of it? If this new scheme don't succeed, there is no other deliverance for the old dotard of the Barricades but guillotining the editors of all the public journals, and supplying their place with the lords of his own bedchamber.

TO CORRESPONDENTS.

C. L., upon Brougham's Natural Theology, is not very intelligible in many respects. He seems to disagree with his lordship on the subject of "*a priori*" evidence of the existence of God. Now, we think his lordship perfectly correct on this point. We cannot reason "*a priori*" on the existence of deity, because *a priori* reasoning begins with the very conclusion to which we mean to come; it takes for granted the very thing we mean to prove. But remember, this observation only

applies to the vulgar notion of deity, as a being distinct from nature itself. The pantheist or universalist may reason *a priori*, because his God is the universe, and he must take for granted the existence of the universe at the outset, and proceed to analyze its component parts, amongst which he will easily find those attributes which are called divine. *A priori* reasoning begins with the original cause, and proceeds to the effect. Thus, if a measure of parliamentary reform is passed, we reason *a priori* when we trace the consequences; but if any great obstruction to trade or public happiness is experienced by the public, and we endeavour to trace the cause of the evil to some foolish principle of political economy, then we reason *a posteriori* by going up in search of the cause.

Now, if you regard the universe as God, you may reason *a priori* of all his attributes, and demonstrate them too; but, if you regard the universe as an *effect*, and not the cause, you cannot reason *a priori* of God; and this is the error into which all our *a priori* reasoners have fallen. Brougham is therefore quite correct in saying that their *a priori* reasoning is absurd, because he goes upon the old absurd supposition that God is something distinct from nature. We think if our friend C. L. had considered the subject thus, he would have found an excuse for Brougham in his ignorance of universalism, and at the same time acknowledged the strict accuracy of his lordship's observations, so far as they apply to the common faith of the world. We regard his lordship as both right and wrong, but one-eyed, and therefore incapable of handling the subject, which he has merely darkened, with all his learning and all his talent.

A priori reasoning is merely analysis, or a decomposition of the subject contemplated. A chemist reasons *a priori* of water, when he decomposes water into two gases; but he does not reason *a priori* of the existence of oxygen, for he began with a compound which was an effect of oxygen, and came to the cause by a process of induction. Now, the oxygen in water stands in the same position as the God of the old world in nature, that is, an ingredient in the universe—not the whole of it. Consequently, it is impossible to reason *a priori* of his existence from the universe (an effect), since *a priori* reasoning begins with the cause. We compare God to the water, and not to the oxygen; but by reasoning upon water, we discover oxygen, and so by reasoning upon the universe, we discover the universal mind, which is an ingredient in the universe. Nothing can be more plain, therefore, than that a universalist can reason *a priori* of God, but a common theologian cannot. We are positive; he is negative.

G. N. must not believe in the simplicity of metals, merely because some of the chemists have classed them under the head of simple bodies; they are simple bodies to the chemist because he cannot decompose them, but for no other reason. It is contrary to reason, contrary to the science of eternal Nature, to suppose that any simple body is in a state of solidity. If a metal burns it must have an inflammable gas *in it*, such as hydrogen; so that there is no occasion for our correspondent to wonder where the hydrogen comes from—it comes from the metal. Future discoveries of chemists will, no doubt, throw more light upon this subject; but no discovery will ever demonstrate the simple character of a solid body, that is, of any body whatsoever. It is the positive and negative, or double principle, which causes solidity, visibility, action, or, in other words, material Nature.

The Shepherd.

[Price 1d.

COMPEND OF UNIVERSALISM.

In the following synopsis of Universalism we shall follow the outline which we formerly gave in No. 31, with such alterations, amendments, and additions, as may suggest themselves.

CHAP. I.

Art. 1. *The universe is one and indivisible, infinite in duration and extension.*

[In the term universe must be included every thing that exists, causes and effects, creator and created. The word "God" is included in the word universe; because though the common acceptation of the word "God" is that of a spirit, or being distinct from external nature, we use the word universe in its broadest and most comprehensive sense, as implying every thing that hath a being, whether it be matter or mind, flesh or spirit. Nor do we make any affirmation in this article respecting creation or the origin of external systems of Nature; for whether they existed as matter or not from eternity, or whatever changes they have undergone in the lapse of ages, still the material of their being had an eternal existence in the power which gave them birth. This first article, therefore, affirms nothing but the being of being itself. It is a mere truism.]

Art. 2. *The universe, though one and indivisible, contains within itself two antagonistic principles, by which all motion is produced. These two principles act by what is generally called attraction and repulsion. By attraction solidity and union are created; by repulsion they are destroyed.*

[In this article we make no allusion to either mind or matter, or attempt a definition of the principles or powers alluded to; we merely speak of their existence. They are powers, positive and negative, active and reactive, male and female, &c.; but whether they be mind or matter, or both, or neither, is more than the human mind can determine, until it has first been defined what mind and matter are. We believe "matter" to be a word which is indefinable. We have never seen a definition, and cannot invent one which is unexceptionable. Mind or spirit, therefore, its antithesis, is indefinable also. Every person, however, must acknowledge that there are opponent powers in Nature, and that these opponent powers produce effects which we call matter and mind. In the controversy respecting the all-pervading mind or soul of the world, perhaps the word mind is by no means suitable to express the perfection of the Divine life. "Mind" conveys to us the idea of reasoning from effects to causes

in search of knowledge; it conveys therefore the idea of ignorance and imperfection. The universal mind of God, taking it as a whole, cannot reason, nor infer, nor conclude from premises. It can have no thought, because thought is a succession of ideas visiting the mind, and arising from extraneous influence; there is no extraneous influence to Deity. It can have no sensation, for sensation is the impression made from without by a foreign power, and God has no external nature. Consequently, every conception we form of a universal mind is so very unlike what it really is, that the word mind is probably very unsuitable to express it. We cannot, and will not propose another; but we will affirm, that if the universal power is not mind, it is something infinitely superior to mind; something that regards mind, intellect, reason, &c., with the same look of conscious superiority as we look upon the sensibility of an oyster, or the instinct of a silk-worm.]

CHAP. II.

Art. 3. *Nature apparently divides itself into power and matter.*

[We say apparently, because we cannot draw a distinction between the two. There are evidently two distinct classes of substance to which these terms may be applied; but these two classes are only distinct in the extreme. They blend so imperceptibly into each other, that they look like one Almighty power, manifesting itself in two opposite modes of being. In characterizing these two principles it is evident that we are under the necessity of giving the originality to power as the active and positive principle. Matter is the effect, susceptible of an infinite variety of modifications, but power is eternally the same. Matter is therefore the negative principle. Power is indefinable, because it is a first principle. It is greater than matter, because it not only fills matter itself, but the space between the particles of matter.]

Art. 4. *Power is what is generally known by the name of Spirit. When we say God is an Almighty Spirit, we mean to say, that he is a power to which there is no opposing power.*

[Almighty means unrivalled. Any being which has not a rival power to oppose it might be termed Almighty. It is opposition which fatigues and exhausts every species of activity. We become weary in walking and standing, because of our own weight. God has no weight; for there is no power to attract or press upon him. We become weary of working, because of friction and the resistance of other bodies: to God there can be no friction,

and no resistance of other bodies. Were there no power to resist we might fly to the moon with the rapidity of thought. *What could prevent us?* And if we had the will to move, even the slightest portion of this will would be sufficient, where there is no obstruction to encounter. Thus to analyse the idea of Almighty power, it becomes very simple. It is only difficult by its infinity and sublimity; not by its absurdity or contradiction. We need not wonder at the eternal and omnipresent activity of God in nature; for there is nothing to exhaust or fatigue him. His work is more easy to him than breathing to us. The positive and negative powers of which we speak, are not so much to be regarded as opposing, as sexual principles, which only make the power greater; for love is the strongest of all power.]

Art. 5. *Power being the positive, requires matter, the negative, to act with and upon. We cannot have, nor can we rationally admit, the idea of power or spirit acting independent of matter.*

[Hence every active power must be organised with matter. God may be called a spirit; but that spirit works in and with the material of the universe; the universe is his body. In this sense, therefore, he is no more a spirit than ourselves. Man may with the same propriety be called a spirit, invisible, intangible; for who has ever seen the mind of a man? There is no inaccuracy in calling God a spirit invisible; but there has always been, and still is a delusion attending it, by making men believe that Nature has less to do with God than a man's body with his mind. This article does not interfere with the doctrine of immortality. There is an infinite variety of modes of material existence. It is in this variety that the Almighty shows his exhaustless resources. There is matter in a dream, although it be all what we denominate ideal. There is matter in a vision—an idea. We form worlds in our own minds, sometimes remarkably vivid, visible, and tangible, which worlds have no more connexion than the world of spirits with the waking world of the present life. The doctrine of the soul's immortality does not exclude the idea of a solid material body, and a substantial world to live in, but implies a mode of existence not perceptible to the present system of sensation. They are only the illogical disciples of the old school of Satan's theology, who talk of spirits without bodies. It is a state of spiritual celibacy, neither possible in practice, nor agreeable to think of.]

CHAP. III.

Art. 6. *Power varies itself according to the material organization with which it combines. This produces an infinite variety of mental and sensitive existence; yet this variety is regularly distributed in genera and species, and each preserves its distinctive character for ever. Every distinct species is original, and is never transformed into another.*

[Many have attempted to confound our ideas of Nature by imaginary transformations of one species into another. They represent Nature like one of ourselves, as learning from experience! beginning with an imperfect production, and gradually amending the first model.

Such ideas are not only unsupported by any facts, but philosophically absurd. We learn from experience only, because there is a world on the outside of us, from which we receive ideas. There is nothing outside of Nature. Nature's first and most simple productions are as perfect in their sphere as the latest, and that she herself thinks so is evident from the fact that she never changes the original model. She makes horses now as she used to make them three thousand years ago.]

Art. 7. *There are two distinct and primary genera of animals, progressive and non-progressive; man is the first, other animals are the last.*

[Man is a traditional animal; he transmits his experience from father to son, and hoards up the discoveries of past generations. By this accumulation of knowledge human society is always assuming new aspects, and human nature new modes of acting and new habits of thinking. Notwithstanding, man is far inferior in political order and justice to many of the most contemptible insects. With all his experience, and all his progress, he has only to advance toward that goal to which the ant and the bee have arrived. These little insects have not attained to their present perfect system of social economy by reason and experience: it is the result of their animal organization, of an impulse which we cannot understand, but to which we give the name of instinct. Had man received such an instinct originally, he could not have been a rational and progressive animal; he would have been a brute; but being defective in this instinct at first, he was worse than a brute. By reason and progress he exalts himself, and thus unites the two extremes in his own nature. He is first devil and then God—the best image of the Almighty. From this a strong argument can be deduced for his sonship and immortality. There is one progressive animal to represent the unity of power, innumerable unprogressive animals to represent the disunity of matter. The wisdom of God is evident in this arrangement, for had there been more than one progressive and rational species, there would have been interminable war between them. But that which is in harmony with universal nature is always best for the individual: a good lesson for us to form all our institutions upon the universal model.]

Art. 8. *Man being first an ignorant being, human society is first constituted upon the basis of ignorance, whose fruit is universal disunion. His second stage of progress is the reconstitution of society upon a basis of knowledge, whose fruit is universal union. This is regeneration, and the redemption of man—the millennial church.*

[This church must begin with one nation, and be followed up in succession by others. It is itself a progressive work, being first incomplete and very defective; but as it recognises a new principle of social life, with a more intimate relationship between the children of men than has ever before been acknowledged, it will gain strength by time and experience. It cannot last for ever, unless some check to population be employed, either by artificial means, or the hidden workings of universal Providence. The Bible limits it to a thousand years, and the Bible in

its general bird's-eye views of the future has generally been remarkably correct. It has only been sectarian interpretation which has failed. But even this interpretation of ours may give a false impression to the reader, if we do not qualify it by saying, that when the thousand years are over, new improvements upon the discovery of some new principle may take place.]

Art. 9. *This ignorance and disunion, and consequent moral perversion, although generally accounted an unfortunate occurrence, known by the name of the "fall of man," are a necessary and indispensable part of the plan of Providence in making man a rational and progressive being. They are the immediate effect of Divine power in the organization of human nature, and all the evil which they contain is chargeable to God only. But that is not ultimate and universal evil which tends to good. God is not the author of ultimate, universal, and hopeless evil, for there is no such thing. He is only the author of temporary and partial evil. To suppose that he is not the author of all evil is to suppose the existence of separate, independent, self-originating, self-moving powers. This is polytheism and heathenism.*

[Hence Jesus Christ, in his character of God's representative, bore all our sins in his own body. The secret meaning of this was, that they were all chargeable upon God, the moving principle of all nature, "without whom not even a sparrow falls to the ground," much less a deed of light or darkness is committed by man.]

CHAP. IV.

Art. 10. *As every inferior and subordinate movement originates in the great Jehovah, first cause of all, it follows that all religious and all political systems are divine, proceeding from God, either by direct revelation, dream, vision, mental enthusiasm, or human invention, moved and controlled by Almighty power. But it does not necessarily follow that they are all equally good, wise, progressive, or suitable to man in a state of scientific advancement.*

[The works of God are infinitely various, and he is always supplanting one work by another in succession. The immediate inspiration of a religion, or its corroboration by miracles, cannot prove it to be a final measure until you come to a universal principle, beyond which there is no possibility of moving. You may attain this in theory, but never in practice. Hence, there is no final measure in politics; there may be in religion, in so far as it is not practical religion.]

Art. 11. *There are two distinct and primary genera of religion as well as of animals, progressive and non-progressive. What is commonly called in Christendom "revealed religion" being the progressive religion, all the rest are unprogressive.*

[Hence Judaism and Christianity hold the same position in the list of religions that man and woman hold amongst the animals. This twofold sexual religion is the only one which has preserved its authority in all ages, and kept up a succession of revelations and witnesses in its favour, whilst at the same time it possessed an expansive character, which opened like a bud to every movement in the political, metaphysical, and scientific world.

This peculiarity has not yet deserted it; it contains the germ of more exquisite, more liberal, charitable, and scientific doctrine, than the most enlightened liberalism has ever yet promulgated.]

Art. 12. *Whilst, therefore, we maintain that all religions are from God, we also maintain that the Jewish and Christian religions are in a higher, more refined, and intellectual sense than others the revelation of God; because they have more of the progressive character of man, and are therefore more suitable to humanity; and because they have been pre-eminent over all other religions, in being adopted by the most scientific and enlightened nations of the world.*

[This is a better argument for the divinity of the Christian religion than ever Christian divine invented. Miracles, prophecies, visions, and angels, are not arguments as long as reason demonstrates the fact, that deception is a prominent part of the plans of Providence and the character of revelation. Deception, however, is only practised upon the bigotted and illiberal mind, which applies promises to itself and curses to its opponents.]

Art. 13. *The total overthrow of Judaism and Christianity is, therefore, a wild expectation; they are incorporated with human nature itself. Their union, regeneration, and universalisation, is the only rational hope of civilized society.*

[And there could not be a better hope, for no better prospects can be held out to the human mind than these two systems present. They even predict their own regeneration and purification after a long reign of hideous abuse. The spirit of the age is evidently resolved to bring them through the furnace; dissenterism to spiritualize them into cant, and Infidelity to destroy them entirely. Both parties will meet with the disappointment which they deserve, and the church will be purified.]

Art. 14. *God is the saviour of all men, especially of them who have faith in God, and faith in one another. He is also the destroyer of all men, especially of those who are separated in heart and affection by discordant principles and treacherous practices. The successive reformations of society will gradually remove the latter, and finally the just and the meek shall inherit the earth in social communion. The destruction of evil does not imply the destruction of the person, but the principle. The destruction of the wicked in heart is their salvation in person. Hell and heaven are both within and around us, in this life and the next. We are always before the tribunal of God, always receiving sentence, and never will be subjected to any other form of trial but that of the moral and physical laws of Nature, which are "God" and his "Tribunal." The only visible God is Nature. No man hath seen the spirit of God, nor can see him. Good is progressive; evil is retrogressive. Evil is the victim; Good is the priest, who offers it in eternal sacrifice to God. Thus Evil and Good are Hell and Heaven, and the two Messiahs—the first, the Lamb slain from the foundation of the world, the second, the Priest forever after the order of Melchizedek.*

[Faith in God and faith in one another make up the double character of universal and individual faith, uniting

the whole with its parts, and the parts to each other in social union. By faith in God we do not mean faith in any particular revelation exclusive of another, we mean universal faith in the all-uniting life of Nature, the source of all union. When we say, especially them who have faith in God and faith in one another, we merely allude to the superior moral influence of such a state of mind, both in this world and that which is to come. There can be no happiness for the species till both-those species of faith are in full operation. They are the true social links of society, and may with great propriety be called the source of salvation.]

CHAP. V.

Art. 15. *All the above propositions may be included in the following:—There is one Omniscient Almighty Power, the author of all things. We are portions of his nature, and instruments in his hand to fulfil his will, which will is twofold, leading us first through a scene of error and division, and landing us finally in a progressive state of fundamental truth and social fellowship. In the first era he acts as a devil, and in the second as an impartial and merciful God. Both the individual and the species have a right to indulge in this hope, to accomplish which there is no defect of power in existence.*

[This is the sum and substance of universalism.]

W O M A N ;

OR THE FEMALE PRINCIPLE OF NATURE.

WE shall comprise, in as few words as possible, the principles of this subject, in the development of which we have met with such obstructions that we thought it folly to proceed according to our own inclinations. We don't complain of such checks, because they are the operations of moral and intellectual powers, which are still predominant in society, for useful purposes.

Nature has always been represented as a female, and God as a male.

This is quite in accordance with our universal analysis, which represents matter, or the visible world, as negative, or female, and spirit, or power, (the invisible world), as positive, or male.

According to the analogy of natural generation, the male precedes the female; and thus, in the line of progress, spiritualism precedes materialism.

Materialism is the feminine principle of religious progress.

Spiritualism and materialism are the beginning and the end of the education of man. Spiritualism has had its reign, and now materialism is in the van.

Materialism is the mother of the new world; but it is not the new world itself: we must not confound the womb with its fruit.

The new world is the union of both, the offspring of both, which unites God and Nature in one. This has never yet been done by any system of religion.

This law of progress from male to female, from active to passive, from generative to productive, is also observed in the subordinate and sectarian movements of human society and opinions.

Thus, in the Christian dispensation, the bridegroom, or male, is represented as coming at the beginning, and

the bride, or female, at the end of the first era of the church.

Thus, also, the Popish church was evidently a spiritual government or polity, founded on a principle of spiritual supremacy. The Protestant church reversed that principle, and adopted a material or magisterial supremacy.

Thus, also, mystical religion, or priestcraft, (we don't mean imposture) was the first great movement of intellect. It began with creating imaginary causes for natural phenomena, most probably through the instrumentality of dreams, visions, and revelations, as well as the common operations of reason and enthusiasm. These imaginary causes were spiritual beings, nor did it connect them with the chemical agents, with which the phenomena were connected. Science is the second or material stage. It overlooked this spiritual agency, and devoted itself to the study of matter only. Science is therefore the feminine or productive principle.

We observe the same universal law of harmony and progress in other departments of nature, which will be gradually brought to light by human enquiry, when the general principle is once suggested to mankind. It is a new field for contemplation for men of research, and those who wish to generalize human knowledge, instead of diffusing it in disconnected facts.

Taking this view of the subject, it is evident that in the religious world we are taught by analogy to look for what are commonly called hallucinations in women, calling themselves the bride, professing to be called of God, to give birth to a saviour of some sort, either bodily or spiritual. These are not impostors, but forerunners of a great change of system, which Mother Nature is about to bring forth, for she is the only and the universal mother or bride. And as the mother and infant son are always united by association of ideas, we will find equal pretensions on the part of the male. He will also, in some way or another, feminize the Deity, or allude to some spiritual mother. In the material or philosophical world we will also find woman assuming a more prominent position. But it is only in the purely moral world that she will ever succeed; neither in politics nor religion will she ever gain any ascendancy, for these are not her department. Moreover, man will be her agent. Woman, representing the material, negative, or atomic department of Nature, is in a state of greater division than man; she cannot act collectively. There is greater unity in the male department, consequently, greater power. It is by the moral influence principally (we don't say alone) that the female sex will rule; that influence is always on the increase.

We have also reason to suppose that infidelity, or at least religious indifference, will continue rapidly to increase. But as the medium principle of charity is the son, or the new spirit of humanity about to be brought forth from the paternal and maternal faith and infidelity of the old world, religious indifference or indecision is more likely now to develop itself than determined infidelity. The next generation will very probably be less infidel and atheistic than the present, and much less illiberal and uncharitable.

The Son of Man, the promised Messiah, is the spirit

of universal charity and social fellowship, and he seems to be dawning upon the gloom of the western world. Men are becoming tired of extremes, and they can be reconciled by universalism alone. Most probably, at some peculiar crisis, some individual like a second Napoleon, or Jesus Christ, or Mahomet, will arise to personify this principle, and give it a political existence. Before this can be done, enthusiasm must be roused and directed to a single point. This will be his task; but he would require more extraordinary powers than seem to be possessed by any individual at present known to the public. Nature, however, is never at a loss for resources; what she has done in times past she can do in times to come.

THE SHEPHERD.

FAREWELL TO MY READERS.

Ach, da ich irrte, hatte ich viel Gespielen,
Da ich dich kenne, bin ich fast allein.—GOETHE.

When I was immersed in error, many were my followers; now that I know thee (the truth) alack, I stand almost alone!

IN the good olden times, when a father girded his loins and took up his crooked staff, to set out for a long journey, it was customary for the wanderer to call his wife, children, indeed the whole family, to receive from his lips some salutary advice. In a similar way, authors who are about to break up for a while their usual conversations with the public, are wont to take farewell of their readers. Thus our Shepherd being on the eve of dismissing his flock, I, who, from the very beginning of his literary appearance have been one of his most faithful auxiliaries, I take up for the last time the pen, to write down a few thoughts, which may be useful to my friends.

Science begins with wonders, splits in doubts, dies in unbelief, and is born again in faith.

There is but one regeneration, which is the regeneration to universal science and universal love.

The science of regeneration is only to be obtained by that universal medicine, which I call tellurism; which embraces both matter and spirit, church and state; that is, the science of the two opposite principles, their relations, oscillations, and final concord.

Nothing of that which is, or has been, can be destroyed; it must be transformed, according to the external laws of progress.

As men cannot stop for a single moment the movement of the stars, they cannot stop for a single moment the progress of mankind.

No one can be equal to the other, each must strive to be equal to the *highest*. How is that possible? Each must become perfect in his own individuality.

The science of our contemporaries is expanded, but shallow. Men like rather to look at the eternal change of the shapes and figures which appear to them in the kaleidoscope of nature. One fact, one figure, follows rapidly the other; and they write down these figures, describe them minutely, and mean to have got possession of the science.

Most of the scientific books are nothing more nor less than novels in the fashion of the Great Unknown. The

chairs, cloth, the very outlines of the embroideries of the times referred to are conscientiously described: but where is the true character of men? My principal endeavours have been to illustrate the defects of science in general, by the science of medicine. I have employed this comparison as the most striking and popular.

Every one can judge of the baneful effects of dead materialism and empiricism, by examining the dejected state of this science.

I opposed to the general cutting, maiming, blood-thirsty, evacuating, irritating, contraststimulating, allopathic, and antipathic systems of our contemporaries, the discoveries of Mesmer, and of Hahnemann—tellurism and homœopathy.

Tellurism embraces all the theories of spiritualism and materialism. It is not an universal medicine, but a science of universal principles.

Homœopathy, on the contrary, is the doctrine of specific individual remedies. It teaches to cure in a mild, safe, and durable manner, by choosing in each case that medicine which will excite an affection similar to that against which it is employed. Magnetism, whether human or mineral, as a remedy, is used by the homœopathist in peculiar cases, in the same way as milfoil, crocus, and the like, is employed in others.

These two sciences will develop themselves in spite of all opposition; in spite of all errors committed by those who profess them, in spite of all difficulties.

The first boat that was launched in the ocean was most probably the prey of the all-devouring element; and yet by this first attempt the world was enriched with the science of navigation. And even now, by all our superior skill, by all our nautical improvements, safety-boats, and all the ingenious inventions of our mechanical age, we must still bewail the loss of many vessels.

Should tellurism and homœopathy sometimes frustrate our skill and our hopes, beware of rejecting these great improvements. Diseases are often more treacherous than the waves, and when the mortal has arrived to the highest pitch of knowledge, he must exclaim, "*Quantum est, quod nescimus*"—How much we do not know!

Gentle reader, bethink well this motto before thou judgest rashly upon men and things. If thou wishest for more information upon these subjects, apply at 108, Park-street, Camden-town.

THE ALPINE PHILOSOPHER.

EDUCATION.

EXTRACT from the Report of M. Rennger, on the celebrated institution of Fellenberg, at Hofwyl, in Switzerland, for the Education of poor children. Fellenberg has two schools, one for the rich and another for the poor. To the former are sent the children of some of the first families in Europe. They are both conducted upon the agricultural principles, the pupils nearly supporting themselves by the produce of their own industry.

"The punishments, says the Report, are few in number, but those which are employed are effectual. There is no reward, except the satisfaction and applause of the master; all those distinctions which might flatter their vanity, and give birth to envy, are banished from the institution. The punishments consist in short, serious remonstrances, made without witness, or only in presence

of the other children ; the exclusion of the delinquent from the general meal follows, according to the circumstances of the case ; or, lastly, corporeal chastisement ; but this takes place only in extreme cases.

"In one of the evening conversations, at which we always took care to be present, Vehrli, after giving an interesting lesson, cautioned one of the children, without however mentioning his name, to be on his guard against the repetition of some fault he had committed. They all became serious in a moment, and remained silent ; every one wore the appearance of being the culprit. In general, when conscious of any fault, they voluntarily punish themselves, by staying away from table : Vehrli then has their share, somewhat less than usual, carried into the next room. Bodily chastisement has been but seldom found necessary ; merely with the youngest, on their first coming to Hofwyl. The observations which Vehrli has made on this subject, in his journal, show how thoroughly he has studied the art of education. He expresses himself in these terms :—

"It is not advisable to make too much use of corporeal punishments in education ; but it must be acknowledged that, when well chosen, and fairly and temperately employed, they can but prove beneficial. Among these punishments, which in some places are so various, the ferula appears to be the most expedient, and I find it necessary to have recourse to this, especially with the younger children. With respect to the elderly ones, if a fatherly admonition proves insufficient, in preference to blows I make use of a vigorous remonstrance, *tête-à-tête*, or subject them to some mortification in presence of their comrades.

"When I propose employing bodily chastisement, it is seldom applied immediately after the fault has been committed, but suspended till the child has had time for reflection. When correction is administered in this manner, the effect is certain, as I have myself experienced ; but he who chastises in anger, without giving himself time for reflection, commits a great error, and, in general education, acts at cross purposes. Of this, experience has likewise convinced me, in such a case we appear to our children a harsh and cruel master. They are, indeed, taught to avoid some faults, but it is the dread of correction alone by which they are restrained : it is neither from affection to their master, nor from the fear of displeasing the Almighty, nor from the desire of their own happiness : it is the blow only which they bear in mind. And what then has been gained ? Surely nothing ; on the contrary, since the esteem and affection of the children are diminished, much has been lost.

"With my elder pupils I succeed far better, by subjecting them to some mortification, and by teaching them, from example, the unhappy consequences which their faults will bring upon them for the future. Children think more of the future than we are apt to believe ; and the consideration of their interest in riper years has great weight with them. They understand, by the care taken to render their future life happy, that we love them, and wish them well ; nor do they see this with indifference.

"Some of them feel very sensibly the approbation and the censure which is awarded in the course of our evenings' conversation to the idle and the industrious. In that hour of calm retirement, when my children are all united in one common feeling, it is a great pleasure to them to hear me say that I am satisfied with them, that they have done their duty. They are the more grieved when I reproach them for any neglect ; when this is the case with either of them, the little fellow feels very painfully that he is the only one who goes to bed without my

shaking him by the hand, to wish him good night. But he must not, the next morning, be treated as if nothing had passed, and escape as usual : it is necessary to persevere during two or three days, or even longer, till some amendment has taken place. This is the best mode of correction. To appear, almost in the same moment, angry and appeased, is to give rise among the pupils to an indifference for all the advice which they receive. Upon this point I was at first deceived, with regard to Yorg ; when I found fault, or remonstrated with him, it seemed to produce a great effect at the time, but a few hours afterwards the thing was forgotten, and he committed the very same fault, as if I had never corrected him."

"The consequences, it is observed in the Report, of this plan of education and instruction are such, that it would be difficult to find, even in the best regulated schools, an assembly of three-and-twenty children where there is so much decency in word and action, such order and obedience, and such mutual affection and kindness ; and certainly, among the many interesting circumstances in the school, this is the most gratifying.

"The constant cheerfulness of the children, even when busiest at work, is a fact of which the commissioners had frequent opportunities of judging. 'We can tell by their countenances,' say they, 'that they are happy, and this problem which Vehrli proposed to himself had been solved, like many others, in the most satisfactory manner. One of the scholars once asked his companions whether they did not find that the hours passed much quicker at Hofwyl than they did elsewhere ; that, for his part, they appeared to be but half hours.'

"When we consider that these three-and-twenty children were born in the most abject condition ; that they had suffered for many years its wretched effects, moral and physical, and see them, in the course of a short period, as it were transformed into new creatures, prepared to fill a useful and honourable station in society, it is naturally asked, what can be the principal cause of so wonderful a metamorphosis ? It is, without doubt, to be attributed to an entire change of situation ; at Hofwyl, not only are the children secured from bad example and other temptations to vice, but they have models of all that is good, honest, and virtuous, constantly before their eyes. The hundred and fifty individuals, there assembled, present the picture of a well-regulated community, every member of which, animated by the spirit of its founder, labours without intermission in the post assigned him for the accomplishment of the end proposed. Wherever these poor children turn their eyes, they behold the image of order and useful industry. The kindness and friendship with which they feel themselves treated raises them in their own esteem, and produces the most salutary influence on their character. Gratitude for all that is done in their favour excites them to deserve it ; but, above all, the constant presence and exemplary conduct of their master is a most powerful stimulus.

"Let parents, therefore, with all who are interested in the subject of education, assure themselves that precepts are of little avail without the assistance of example. The child who is subjected to privations, or obliged to undergo painful labour, may submit to force, but he will throw off his shackles the moment he is undeterred by the dread of punishment. If, on the contrary, those to whom he looks up, live themselves agreeably to the same rules of conduct which they lay down, he perceives that what is exacted of him tends to his own advantage ; he yields therefore to reason, and gladly follows the path

traced out for him. The influence which Vehrli possesses over his pupils is doubtless owing, in a great measure, to his putting himself entirely on the same level in every thing that concerns their manner of life. His food and his clothing are the same, he bears a part in all their labours, and enjoys no pleasures but what they share. How should they do otherwise than form themselves on the model of him for whom they entertain both esteem and affection.

"The journal of Vehrli also shows the influence of opinion on this little community, which indeed maintains a kind of moral discipline among the children. He relates, that while they were at play, at a time they were talking and laughing with the utmost cheerfulness, one of the scholars lately admitted made use of an oath; there was instantly a profound silence throughout the little troop; the boy, astonished, looked round to discover what had happened, when Vehrli explained its meaning; and the lesson proved so effectual that it was never necessary to repeat it.

"From the extraordinary success of this institution, one might be tempted to believe that the pupils were selected, on account of their talents or understanding, or taken from families distinguished for moral worth. Even on this supposition the result obtained by M. de Fellenberg is most satisfactory; but we should then have no right to infer that, by multiplying the number of such establishments, the same phenomena might every where be produced. Far, however, from any selection having been made, the fact is, that the assemblage of these three-and-twenty children was formed entirely by chance; that several were received without any recommendation, either from the village pastor or from the police-officers belonging to the district; that they came from all the different Swiss Cantons, and that two only, thoroughly prostrate, have been expelled."

PROSTITUTION.

THE following is an extract from Colquhoun on the Police of the Metropolis. The subject is one of the utmost importance; one with which the health, and the morals, and the intellect of the species is intimately concerned. An incalculable amount of mischief is done to humanity by the abuses of this department of love. Diseases of infinite variety and subtlety are generated, which defy the utmost skill of the medicinal art to eradicate. These diseases affect the whole vital and intellectual system, and communicate their virus to the offspring of the affected, so that men of prudence and temperance experience in their own guiltless natures the fatal effects of diseases contracted by the indiscretion and vicious habits of their progenitors. Nervous weaknesses, acrophulous aores, feverish constitutions, and the innumerable varieties of diseased sensibility, frequently originate in the fatal excesses of mercenary love. Yet our legislature pays no attention to this important subject, with which the happiness of the nation is so intimately connected; and what is worse, the moral (rather immoral) prejudices of the public prevent them from applying the only palliative which the present system admits of, that of a licensing and inspecting system. There is no cure for the evil in this old world. If ever it be finally removed, it must be by some species of community which will entirely change the moral aspect of society:—

In point of extent it certainly exceeds credibility: but although there are many exceptions, the great mass (whatever their exterior may be) are mostly composed of

women who have been in a state of menial servitude, and of whom not a few, from the love of idleness and dress, with (in this case) the misfortune of good looks, have partly from inclination, not seldom from previous seduction and loss of character, resorted to prostitution as a livelihood.

They are still, however, objects of compassion, although under the circumstances incident to their situation they cannot be supposed to experience those poignant feelings of distress which are peculiar to women who have moved in a higher sphere, and who have been better educated.

The whole may be estimated as follows:—

| | |
|---|--------|
| 1. Of the class of well-educated women it is earnestly hoped the number does not exceed | 2,000 |
| 2. Of the class composed of persons above the rank of menial servants, perhaps | 3,000 |
| 3. Of the class who may have been employed as menial servants, or seduced in very early life, it is conjectured, in all parts of the town, including Wapping, and the streets adjoining the river, there may not be less, who live wholly by prostitution, than | 20,000 |
| | 25,000 |
| 4. Of those in different ranks in society, who live partly by prostitution, including the multitudes of low females, who cohabit with labourers and others without matrimony, there may be in all, in the metropolis, about | 25,000 |
| Total | 50,000 |

[This is a calculation for the beginning of the present century. The number is now considerably greater, being estimated by many at seventy or eighty thousand.]

When a general survey is taken of the metropolis; the great numbers among the higher and middle classes of life who live unmarried; the multitudes of young men yearly arriving at the age of puberty; the strangers who resort to the metropolis; the seaman and nautical labourers employed in the trade of the river Thames, who amount at least to 40,000; and the profligate state of society in vulgar life, the intelligent mind will soon be reconciled to the statement, which at first view would seem to excite doubts, and require investigation.

But whether the numbers of these truly unfortunate women are a few thousands less or more is of no consequence in the present discussion, since it is beyond all doubt that the evil is of a magnitude that is excessive, and imperiously calls for a remedy. Not certainly a remedy against the possibility of female prostitution, for it has already been stated that it is a misfortune that must be endured in large societies. All that can be attempted is, to divest it of the faculty of extending its noxious influence beyond certain bounds, and restrain those excesses and indecencies which have already been shown to be so extremely noxious to society, and unavoidably productive of depravity and crimes.

The author is well aware that he treads on tender ground, when in suggesting any measure, however salutary it may be in lessening the calendars of delinquency, it shall have the appearance of giving a public sanction to female prostitution.

Under the influence of strong prejudices long rooted in the human mind, it may be in vain to plead "plus apud me ratio valebit quam vulgi opinio." (Reason has more influence with me than the opinion of the vulgar.)

If, however, the political maxim be true, "Qui non vetat peccare, cum possit, jubet," (he who does not pre-

vent crime when he can, commits it), it certainly follows, that by suffering an evil to continue, when we have it in our power, in a great measure, to lessen or prevent it, we do violence to reason, and to humanity. That a prudent and discreet regulation of prostitutes, in this great metropolis, would operate powerfully, not only in gradually diminishing their numbers, but also in securing public morals against the insults to which they are exposed, both in the open streets and at places of public entertainment, cannot be denied.

That young men in pursuit of their lawful business in the streets of this metropolis would be secured against that ruin and infamy, which temptations thus calculated to inflame the passions have brought upon many, who might otherwise have passed through life as useful and respectable members of society, is equally true. While frauds, peculations, and robbery, often perpetrated for the purpose of supporting those unhappy women, with whom connections have been at first formed in the public street, (and in which they themselves are not seldom the chief instruments), would be prevented.

Were such proper regulations once adopted, the ears and eyes of the wives and daughters of the modest and unoffending citizens, who cannot afford to travel in carriages, would no longer be insulted by gross and polluted language, and great indecency of behaviour, while walking the streets. Indeed it is to be feared, that the force of evil example, in unavoidably witnessing such scenes, may have debauched many females who might otherwise have lived a virtuous and useful life.

Whatever consequences might be derived from a total removal of prostitutes (if such a measure could be conceived practicable) with respect to the wives and daughters who compose the decent and respectable families in the metropolis, this apprehension is allayed by the proposed measure. While virtue is secured against seduction, the misery of these unhappy females also will be lessened. Their numbers will be decreased, and a check will be given, not only to female seduction, by the force of evil example, but to the extreme degree of depravity, which arises from the unbounded latitude which is at present permitted to take place, from the unavailing application of the laws made for the purpose of checking this evil. If it were either politic or humane to carry them into effect, the state of society where such members are congregated together render it impossible.

Although by the arrangement proposed, a kind of sanction would, in appearance, be given to the existence of prostitution, no ground of alarm ought to be excited, if it shall be proved, that it is to lessen the mass of turpitude which exists; that it is to produce a solid and substantial good to the community, which it is not possible to obtain by any other means.

What therefore can rationally be opposed to such an arrangement? Not surely religion, for it will tend to advance it: not morality, for the effect of the measure will increase and promote it; not that it will sanction and encourage what will prove offensive and noxious in society, since all that is noxious and offensive is by this arrangement to be removed.—Where then lies the objection?—In vulgar prejudice only.—By those of inferior education, whose peculiar habits and pursuits have generated strong prejudices, this excuse may be pleaded; but by the intelligent and well-informed it will be viewed through a more correct medium.

Ingenuous minds are ever open to conviction, and it is the true characteristic of virtuous minds, where they cannot overcome or destroy, to lessen as much as possible the evils of human life.

To the numerous unhappy females in the metropolis who live by prostitution, this observation peculiarly applies. The evil is such as must be endured to a certain extent—because by no human power can it be overcome; but it can certainly be very much diminished—perhaps only in one way—namely, by prescribing rules—"Thus far shalt thou go, and no farther"—the rules of decorum shall be strictly preserved in the streets and in public places. In such situations women of the town shall no longer become instruments of seduction and debauchery.

It may be asked, will not all this promote the cause of religion and morality?—admitted; but could not this be done without giving the sanction of the legislature to pursuits of infamy? The answer is obvious;—the legislature has done every thing already short of this, to effect the object; but instead of promoting good, the evil has increased; and it is to be lamented that it is daily increasing.—Instead of the walks of prostitutes being confined as formerly, to one or two leading streets in Westminster, they are now to be found in every part of the metropolis—even within the jurisdiction of the city of London; where the dangers arising from seduction are the greatest, they abound the most of all late years.

In adopting the proposed measure, the example of Holland may be quoted, where, under its former Government, the morals of the people in general were supposed the purest of any in Europe, while the police system was considered as among the best. Italy has also long shown an example, where prostitutes were actually licensed, with a view to secure chastity against the inroads of violence, and to prevent the public eye from being insulted by scenes of lewdness and indecorum.

Female chastity, which is highly regarded by the natives of India, is preserved by rearing up a certain class of females, who are under the conduct of discreet matrons, in every town and village; and with whom, under certain circumstances, an indiscriminate intercourse is permitted—a measure of political necessity. Their morals, however, in other respects, are strictly guarded, and their minds are not susceptible of that degree of depravity which prevails in Europe. They are taught the accomplishments of singing and dancing, they exhibit at public entertainments, and are even called upon to assist at religious ceremonies.

The unrestrained latitude which is permitted to unfortunate females in this metropolis, is certainly an inlet to many crimes.

TO CORRESPONDENTS.

We have received the second parcel from Mr. Philip Wood, but must decline entering into the Astrological controversy for a very good reason. We have already expressed our opinion of the subject. We believe there is in nature such a correspondence between individual and universal phenomena, as to serve as a foundation for astrological science, but we consider astrology of no use in the ways of life. Its only use is to show the universal harmony of Nature's mechanism. It is a purely religious science, but it is sadly abused by the superstitious follies and opinions of its professors, who in general are men so exclusively attached to it as to make themselves look like impostors to the world, from their enthusiastic description of the certainty of their calculations.

The Shepherd.

EDITED BY THE REV. J. E. SMITH, A. M.

No. 52.]

SATURDAY, AUGUST 22, 1835.

[Price 1d.]

CONCLUSION.

WE now take leave of our little flock, with the satisfaction of thinking that we have not done so because of their desertion; and if we cannot say from personal knowledge what effect we have produced upon the minds of our readers, who are scattered over all parts of the country, we have reason to believe, from the correspondence, we have had, that we have suggested new views of Nature to many, and destroyed some illiberal and exclusive feelings. If so, we have paved the way for future improvements. Nature is always slow in her operations; her first movements are invisible to us. It is only when the organization is completed, that we know she has been engaged in an intellectual work. Nor is it one individual alone that she employs, but thousands conspire to bring into being the most insignificant results.

And if, with all our good will, and desire of benefitting our fellow-creatures, we have failed to produce any *practical* good, we do not consider that in this respect we are behind any other of the instructors of the people. Of this we are very certain, that our doctrine, though not *nominally* practical, is of a practical tendency; so much so, that every attempt at practical measures without it will prove a miserable failure.

Practical measures are merely an *ignis fatuus*, without a spiritual basis of universal principles. The public can only be convinced of this by experience. In the opinion of our radical philosophers, the great evil of which we have to complain is burdensome taxation. Yet forty millions of taxes have been taken away since the peace, and still the complaints of the public are yearly increasing. Take away another half of the burden, and what would be the consequence? Not popular contentment, certainly. Something more is wanting than merely a reduction of taxation, or an extension of the franchise. The people are their own enemies, and would devour one another, even without the aid of the tax-gatherer.

But the people have long expected relief from such measures, and still labour under the delusion. This delusion, and the agitation it creates, hasten on measures of retrenchment and reform, which serve as stepping-stones to a general re-organization, but no perceptible benefit is at present derived from them. The disappointment is felt by many, and ere long the people must be convinced that this clipping and paring system of reform is merely an imposition on their credulity; that both they and their leaders are deceived by fanciful and extravagant theories. These sham reforms are merely lessons of disappointment, to lead us to a more substantial basis

of truth and prosperity. But they are the legitimate offspring of the public mind—concessions on the part of our rulers to public clamour. The people have no right to complain that a universal basis of reform is not laid, for they themselves alone must lay the foundation. And how can they do so, as long as themselves and their favourite instructors are so individualized in mind, and led away by the spirit of bit by bit reformation. The country never can obtain more than a contemptibly small modicum of relief, till the public mind is directed to the discussion of a universal first principle of religion and government. There lies the source of the evil and the good.

Nothing but politics, now a-days, can absorb the public attention! a very good subject, if rightly considered, for politics is public morality, as religion is private morality. Politics in this sense is the most universal of the two. But the people greatly deceive themselves if they imagine that they are studying politics at all, when reading dissertations and leading articles upon corn laws, paper currency, tithes, and other popular subjects. They are under as mystical a hallucination as the Reformers or Puritans of old, when discussing the subjects of transubstantiation, and the divine right of kings. For of two opinions of eternal and necessary absurdity they are endeavouring to discover which is the right. Do they imagine they can by local applications cure a constitution which is universally diseased, when the whole head is sick, and the whole heart is faint—from the crown of the head to the soles of the feet all is wounds, and bruises, and putrefying sores? Do they imagine they can ever do universal good by partial means? They will find that when the sore is healed in one spot it will burst out in another.

We have directed the minds of our readers to universal subjects, because we believe that with these alone can profitable reformation begin, and the very first and most important of all these is the twofold character of universal nature, the application of which to religion and politics will prove a healing balm whenever the attempt is made. This is not only a universal principle, but the fundamental principle of all useful knowledge, and yet it is at this day a universal secret! On this account men are bigots in religion, and furious and illiberal partizans in politics.

If we have not removed the mystery of this omnipresent subject, it is not because it is not true, but because it is infinite, and unsearchable. Mystery is the intellectual atmosphere of man; he must breathe it for ever. But the universal truth and the particular fact are two

very different things. A man may know, that an oyster is a living creature without knowing whether it has eyes or ears. The general truth is first discovered before he even thinks of looking for eyes. It is by an examination of some particular facts that general truths are perceived, but an infinity of detail is left in arrear which will occupy the ingenuity and research of mankind for ever. Thus universal truth holds a middle position between a knowledge of particular facts thus:—Facts—truth—facts—that is, you may discover a general truth by a few facts, but still there are innumerable facts in reserve of which you know nothing. We have showed you a universal truth from facts, but we do not pretend to disclose the infinite secrets of Nature.

Once again we say, that we are not responsible for all the contents of *The Shepherd*, our own articles excepted. There are many things in it to which we never would subscribe our own name. Of the "Alpine Philosopher's" doctrine we can say, in general terms, that its bipolar character entirely agrees with our own. The details of which he speaks belong to that series of facts which succeeded the discovery of a universal truth. These are at present, *sub judice*, at the bar of our own judgment.

We shall not thank our readers, as some editors do; for we are under no obligation to them, nor they to us. We have all followed the impulse of our own minds. We have conducted *The Shepherd* for one year, without a farthing of remuneration; they have paid one penny a-week for our labour. If they do not complain, we do not; and if we do not, they have no cause to murmur.

We hope it shall not be long before we meet our readers again in a character similar to that which we have sustained in the *Shepherd*; but as we cannot predict individualities, we will not make the promise. We shall do the work that the universal spirit has designed for us, and we do not desire to do more. We have so much faith in his wisdom and ultimate mercy, that we willingly consign ourselves to his providence. There is a pleasure in dependence which none but dependents know. In life we shall cherish it, because it is consoling; and at last we shall die, not without fear and without hope, a double negative, but with hope and without fear, the positive and negative, in comfortable union. This is our philosophy. We begrudge not the sectarian believer or infidel his horrific notions of God and of Nature.

THE SHEPHERD.

POSTSCRIPT.

WITH regard to the summary in our last number, we made it as short and general as possible. The detail, so far as we have discussed it in the *Shepherd*, may easily be discovered by consulting the index. The compend contains merely the first principles, the parent stocks, from which all the other principles necessarily arise. Indeed they almost all take their origin from the bipolar principle, which is the most universal and important of all physical and metaphysical truths; and forms the characteristic feature of the doctrine of the *Shepherd*.

We have not given a list of errata, because any errors which the work contains are such as the intelligent reader can easily rectify. It is almost impossible to avoid typo-

graphical and other blunders in a weekly publication, to which the parties conducting it are not exclusively devoted. In page 73, *practical* is substituted by mistake for *poetical*, which is rather an awkward blunder; in 217, *continued* is put for *contrived*, and in 290, *degradation* is put for *depredation*; other errors are noted at the end of several numbers.

Complete copies of the *Shepherd* may be procured by applying to our publisher, or his agents in town or country.

Correspondents who want their papers returned may have them by application. Several which we have been requested to keep till called for have been lying for weeks and months. If the moths should eat them up, where is the philosophy which is able to replace the dislocated atoms?

FAREWELL TO THE SHEPHERD.

To quell the rancour of conflicting sects,
Expose their mutual errors and defects;
Support the truth, while justice holds the scales,
Tho' folly rails, and bigotry bewails:
To chase the mists of prejudice, and heal
The wounds inflicted by fanatic steel:
To raise the lowly, and to curb the proud,
And show that hope attends beyond the shroud;
To cull a gem from each and every creed,
Where reason guides, or slavish passions lead;
To gather in one universal fold,
The meek enquirer, and the zealot bold,
Has been thy aim, dear Shepherd! Hast thou sped?
If so, then glory shall adorn thy head!
But is thy labour done—thy task complete?
Hope mournful sighs; experience says, not yet!
Deep in the heart that sad conviction lies,
And doubts and fears alternately arise:
Sectarian malice, round each heart entwined,
Subdues, relaxes, and inflames the mind;
By party governed, each to all opposed,
Impatient, wroth, too easily aroused:
One dogma shaken, straight the phalanx wheels,
Fierce as a mastiff fixing on your heels.
Their craven souls refuse to take the field—
Too mean to fight, or honourably yield.
Proceed, dear Shepherd, with a pastor's care;
Vituperation lays the dastard bare,
Reveals the sophist, treachery unmasks,
That while it bullies for protection asks.
Unheeded, let them "howl their idle wrath,"
Truth be thy crook, and honesty thy path!
To leave us now, without a *Shepherdess*,
Against thy own religion would transgress;
And ere we bid adieu! we hope to see
Another proof of "*bipolarity*!"
And like the fabled lovers, closely tied,
Thy spirit wedded to its proper bride.
May the gods make thee, pitying thy plight,
An intellectual hermaphrodite!

INTRODUCTION.

IN presenting a Second Volume of the *Shepherd* to the public, after an interval of sixteen months, we must inform our readers that the first was brought forth under very unfavourable circumstances, chiefly bad health. These created a passivity of mind which made us less circumspect, discreet, and industrious, in respect to the contents, than we hope to prove in the present volume.

We mean to proceed upon the same universal principles as before. The analysis of religious opinions will be our chief employment; but we shall accompany this sacred pursuit with such a variety of important and authentic information, upon subjects not generally known, as to make the *Shepherd* a publication *sui generis*, peculiarly original. Having, therefore, no rivals, we need not introduce our little work by any censorious animadversions upon the productions of other men, for we have need of all those productions to aid us in the conception of a universal faith.

There shall be nothing of a personal nature in the work, nothing that has a tendency to give publicity to the name of any individual, or commend him to public patronage. Our principal object will be the correction of the errors, abuses, and illiberal prejudices, which belong to the three great classes of Theologians, Deists, and Atheists—the Tories, the Whigs, and the Destructives of Religion. We shall set our faces against all these, upon the principles of PANTHEISM, adopted by the wise and the good, in all ages, but hitherto rejected by sectarianism and fanaticism.

In doing so, we take no man, no book, as our standard, except the Old and New Testaments of Nature and Providence. The first treats of Divine wisdom as revealed in *Space*, the other in *Time*. The first includes all the demonstrable and experimental sciences; the second devotes itself to the subordinate but most vital consideration of the history of human nature and of social experience.

In these two books are contained a perfect and an immutable revelation of Divinity, of which the two Jewish books are only the types and shadows. The types and shadows we do not despise, but we treat them as types which must finally be swallowed up in the Great Original—the Everlasting Gospel.

UNIVERSALISM, PANTHEISM, &c.

THE progress of society is evidently tending towards some principles of action and of opinion very different from those which have hitherto agitated the minds of nations, or religious and political sects and parties. When any long cherished system has proved its inability to confer the good which it promised, the common sense of the public mind gradually recedes from it, and leaves it to droop, like the flower which the sun has deserted. This has long been the case with all the religions of the world. An awful shaking of the nations has been experienced for many years. It has been felt in Europe and in Asia, the primal sources of all the antiquated religions of history. Men are discontented with the limited views of their ancestors upon universal subjects. Science has extended the field of vision, of experiment, and even of imagination. The mind now longs for institutions commensurate with its own powers of expansion. The creeds and the establishments of ancient systems and ances-

torial legislation are too narrow, too beggarly, for its accommodation. There is an awful discordance between the wisdom of the past and the knowledge of the present. Each has its representatives: one party insists upon the conservation of ancient forms, institutions, systems, ceremonies, creeds, customs and opinions. Another insists upon a modification of all and each in conformity with the new character, with which the discoveries of science and the experience of ages have invested the human mind. The latter party is a growing party. Formerly it was a small minority, now it embraces a large proportion of the people; and were it not for interested and pecuniary motives in those whose property, influence or prospects, are connected with existing circumstances, it would be still greater. The changes, however, which existing circumstances are yearly experiencing, are always breaking in upon the conservative prejudices, and where the religious are subject to the pecuniary motives, which is most frequently the case, the cause of innovation and amendment proceeds by slow and silent marches, under the imperceptible guidance of what is mysteriously but elegantly termed the Spirit of the Age.

Religious systems are the greatest hindrances to improvement of every kind; they have always been a dead weight upon science; they have persecuted all the sciences by turns. The reason is that science is by nature an innovator. New discoveries and new inventions necessarily alter the outward circumstances of men. And churchmen, discovering that it is a law of Nature that the whole man, animal, intellectual, moral and spiritual, must move together in harmony, rather than suffer a spiritual movement to take place, set their breasts against every other movement which seems likely to cause it. Nothing can be more natural and simple than this relationship of cause and effect; but the consequence is, that there is a concealed warfare between the cultivators of science and the zealous adherents of ancient systems.

However, this opposition is so contradictory, so divided, and so inconclusive and unsatisfactory in itself, as to defeat its own ends, and actually in many cases, to aid its adversary. The ancient systems are also in a state of chaotic confusion, and defeat their own ends by their petty warfares. But there are one or two points upon which they all agree, and around these common points they rally and are strong. For want of those points the adversary is weak, and can only collect its forces under political banner.

Infidelity, in its common acceptance, is not a satisfactory state of mind. There is a homelessness, a hopelessness, and orphanism about it, which is peculiarly oppressive to the musing and contemplative. In the bustle of active life, when the whole soul is employed on schemes and projects, and the various concerns of industry and commerce, there is very probably no want experienced; there is merely a negation of pain and pleasure; but it presents too deep a gloom to the poetical, the metaphysical, the philosophical mind, ever to become the pet or the nursing of the standard press, which belongs, in an especial manner, to the higher order of intellect. Yet that higher order of intellect is aiming at a change in present opinions. We perceive it distinctly even in some of the leading conservative periodicals of the day,—*Fraser*, in particular, whose religion, though far from being of a Catholic or Universal character, is still much in advance of the provincial theology of the little enivelling party, for which it gossips and revels in Conservative abuse. The

liberal periodicals and reviews are still more universal, though more dryly scientific and mechanical; but not one of them dares to acknowledge *Infidelity*, in its vulgar sense, the basis of its religious principles. They never will. Poetry would "run a muck" upon them.

Atheism is still less likely ever to be the fundamental principle of any party of influence in society. It wants a meaning. It is so exclusively confined to mechanical principles, without even a moving power for its machinery, of which it can give a definition, that we can only regard it as a mental eccentricity. It wants sympathy for a large proportion of human existence, into which it cannot penetrate, but which it contrives very well to shock and outwardly annoy. Being still possessed, however, of equally generous and well-intentioned principles, as those to whom it is opposed, it generally devotes its sympathies to outward circumstances, and pushes on the movements of the political world towards the goal of equal rights and privileges. Infidelity of every species combines with it, and these two are at present most actively and most usefully employed with Dissenters and Catholics, in sapping the foundations of the petty nationalisms of religion, and aiming at the emancipation of the mind from the fetters of prescribed forms of faith and worship. But Atheism cannot show its *own* face in the contest; its works are generous and good, for they are the expressions of the common feelings of human nature, unfettered by antiquated dogmas; itself is a different thing; there is no pabulum, no resting place in the human mind for it; it seems to be, it is a solitary thing, a hermit; it wants chords of sympathy to run along society. There is a railway for religious principles, but Atheism must walk it all a-foot.

Hence, all attempts at association, under the banner of Atheism or Infidelity, have failed, and must fail.

Still, however, religion seems to be in equally as bad a plight. There is not a single sect upon earth which can afford a resting place for the mind: there is something repulsive in all; and they are so conscious of this, that they really dare not show themselves in public in their *true* character. Except in churches and conventicles, where ecclesiastics preach and pray according to ancient forms and usages, there is no open avowal of the standard principles of Christianity. The epithet "Christian" is sometimes used as synonymous with "good;" and the Conservatives and Whigs frequently profess their determination to support the respectability of the church; but this superficial language is very unmeaning, and the total abstinence from the more characteristic forms of old Christian expression proves either that the parties have utterly lost the spirit of Christianity, or that they are ashamed, or afraid, to exhibit it in public. Among all the popular publications of the age, which are not purely ecclesiastical, there is not one which openly avows itself a Christian, in the general meaning of the term. There are very few Christian newspapers. The *Record*, the *Watchman*, the *Christian Advocate*, and the *Scottish Guardian*, are the principal that we recollect. The *Standard* only says it is Christian; but the only proof it gives is its abstinence from political discussions on Good Friday! In public meetings the speakers are always ashamed of Evangelical Christianity. It is as cowardly as Atheism or Infidelity; in fine, there is no systematic form of religion or ir-religion which dares to show its face. Neither Orthodoxy nor Heterodoxy has courage to avow itself. There is only one species of religion which can universally declare itself, and that is, THE UNIVERSAL FAITH of God and Providence—Nature and Eternal Wisdom. This tells with effect amongst all parties: they all make use of it in appealing to the public; from the highest saint down to the lowest scoffer—all, all seem conscious that there is a charm in this of which all parties must feel the force.

Yet, curious to tell (*mirabile dictu*), this universal style of speech, which the conflict of public opinion has enforced, is, perhaps, less sincerethan any other. The Fanatic uses it because he dares not to use his own; the Churchman uses it because he knows that no other would tell upon the public mind. The Editorial we always uses it, because he knows that it is the most universal in its meaning. The Infidel uses it, because he thinks the public is a fool, and must be gammoned. They all use it, without sincerity, inasmuch as they all, at the same time, re-

serve some inward convictions which they have not the courage to express.

Hence it follows that universalism is partly developed in the public press as a whole, and in public meetings, and in popular writings; but being the result, not of feeling, but of necessity, the development is imperfect. It requires the zeal of an enthusiastic mind to give it an organized being.

The ultimate design of the *Shepherd* is to give an incipient organization to Universalism.

For this purpose we have chosen the broadest possible basis of faith or truth, viz., UNIVERSALITY.

We build upon the basis of unity of design, in the infinitely variegated movements of Nature. Sectarianism of every degree and of every name, including Atheism and Infidelity, adopts the contrary principle of confusion. The religious Sectarian has two distinct personal gods—a good and an evil. He maintains that the good god can only reveal *one* religion, and that *his* is that one. The Infidel carries this principle a little farther, and excludes that one, and every other one. The Deistical Infidel acknowledges a god who has nothing to do with the petty controversies of men! The Atheistical Infidel acknowledges no conscious universal spirit in nature, and therefore refers to chemical agency, phrenological bumps, and other causes, for explanations of natural phenomena, in a manner which is not, perhaps, very intelligible, but which affords a very summary way of getting rid of a subject, for those who have not much inclination for minute inquiry.

All these parties *really* belong to one school—the Sectarian or non-Universal school. They all maintain this first principle, that the movements of Nature are not the immediate or ultimate effects of a universal will or spirit. Atheism is merely the advance-guard of this school. Partial Infidelity must of necessity lead to Universal Infidelity. Now that the Sectarian is a partial Infidel, his own mouth will testify. Ask him if Mahometanism is a work of God. He replies, No. Ask him if evil is the offspring of God. No; is his answer. Ask him if the finger of God is to be seen in *this* or in *that*. No, no, no! is his answer, until you come to some of his own favourite dogmas—facts, miracles, prophecies, or manifestations—and *then* the finger of God is visible enough. We call this Infidelity, because it is a denial of the Divine works, and of His divine wisdom in those works, which, appearing in His creation, ought to be acknowledged as His—in Whom and by Whom and through Whom are all things, and to Whose glory all must at last redound in the mind of the wise, which is modelled upon universal principles.

There is not a single religious sect which does not come under this category of Infidelity. We say, therefore, that all the old religions of the world belong to the genus, Atheism, or Infidelity; and it shall be our business to class them all three together, and oppose them all, as partial, illiberal, uncharitable, and destructive to the harmony of human society.

Our principle is very different. We acknowledge the divinity and the design of all the works of Creation and Providence. We acknowledge every variety of manner in the production of those works. We acknowledge the evident opposition between those works—one being set against another in the moral world, even as chemical elements are set against each other in the material world. We acknowledge different degrees of value in respect to mankind in those works. One religion may be better, more universal, more liberal, more reasonable, more literally true than another, and yet all originate in one source. The contrariety is necessary to develop the mental faculties of man in the infancy of society. But the re-union of all in a universal church is also necessary, and must take place.

To have a universal basis we must not confine ourselves to what is generally understood by the *works of Nature*. This is Infidel, or negative Universalism. We must have the *double* basis of the *works of Nature* and of *Providence*. These latter include all religions. We therefore take the book of Nature in one hand, and the books of religions in the other; and we acknowledge the authority of both. The Christian, therefore, will not find us opposing the authenticity of his books; we merely take them as he gives them. Their divinity does not prove their literal truth, and their partial inaccuracy, or imperfection, does

not disprove their divinity, even taking divinity in the sense of direct revelation, by audible voice and vision, accompanied by superhuman demonstrations of power. The Divine wisdom may be employed in making imperfections in a book as well as in a butterfly's wing, or the petal of a flower; and it is as reasonable to suppose the eternal mind engaged in superintending the visions of the founder of a superstition, as in laying the foundations of a world, or in making the fang of a serpent's tongue. The extremely little is, in our opinion, quite as magnificent and divine as the extremely great. Though there be no melody in the braying of an ass, we must not infer that it was the Devil who made the ass. All is of God, and all will show forth His wisdom and His glory to him who forms his mind upon the universal model.

This universal model *alone* is "*Divine*," in the highest sense of the word. *Partial divinity* is profanity, error, and delusion.

To the Universal Church, therefore, let us all steer our course to the human temple of the spirit of God and Nature, of which the political churches are merely the profane and outward symbols. In the heart alone can true religion dwell, and that religion consists in a universal brotherhood, cemented by the acknowledgement of a UNIVERSAL FATHER and a UNIVERSAL MOTHER.

WORTE EINES MENSCHEN—VON HARRO HARRING.

WORDS OF A MAN.

The man who wrote these words, belongs to that exceptional class, to whom nature has been prodigal in endowing them with that organization in which the intellectual and moral faculties are found in the highest state of perfection.

Harro Harring, a Dane by birth, is one of the finest poets, deepest philosophers, and most refined moral characters that appeared in the last decennium on the stage of Europe. He has written novels, dramas, songs, historical and political works, all of which bear the stamp of a lofty genius and deep moral sentiments. He is neither Tory, Whig, nor Radical, but a philanthropist of the purest metal. He has understood the aim and end of the progressive development of mankind, and his aim is to break down the corruption of the present antagonistic systems of governments, and religious sects, and to reform the world by a new social religious development of the intellectual, moral, and physical faculties of man.

He, however, is not like the generality of the philosophers, a mere passive looker on of passing events, but an active champion in the cause of the people. He fought for the liberty of Greece, for that of Poland, Italy and Germany. He fought with the sword whilst his songs and other poetical and political works inflamed the different nations to the holy struggle.

His songs are so popular in Germany, that in spite of the censorship, seven different editions have been published in the space of a few years, and they are sung by young and old on the borders of the Baltic, on the banks of the Rhine and the Danube, the Eider and the Adige.

His history of Poland has been translated into the English tongue.

Under these circumstances our readers may easily guess the fate of this Scandinavian genius. He has been hunted after everywhere by the bloodhounds of the holy alliance, dragged away by force from Switzerland, handed over to Louis Philippe, who, as the worthy sheriff of the allied despots, sent him well escorted by gendarmes to Calais, and from Calais to London. The present work was written by Harro on one of his peregrinations. It is dedicated to the readers of *La Mennais' Words of a Believer*. We extract a few original passages.

XI.

1. "Eighteen hundred years have elapsed since J. C. sealed with his blood his philanthropic doctrines, and the misery of mankind has not been diminished.

2. "The end of C.'s doctrine was to free mankind from the fetters of superstition, to promote virtue, that is the development of humanity.

3. "The maxims inculcated by him were equality of all men without regard of persons, self-consciousness of man's

divine nature as a free rational being, humanity, or love of mankind.

4. "Belief in immortality and eternal justice. The application of these principles was left to the will of man."

XII.

1. "The divine principle of mankind has hitherto produced nothing for the welfare of mankind. It has been perverted by egotism.

2. "I call *divine* whatsoever spiritual is in man, what is dearer to him than all his physical existence, and his goods and chattels.

3. "As soon as egotism perceived that Christianity threatened with destruction, falsehood, and selfishness, it armed against it, but being unable to eradicate it, it strove to pervert it. Hence a new priesthood was created, an instrument of despotism and superstition.

4. "The mock Christianity has robbed man of his holiest right the right of developing himself as a free, rational, human being. Man's nature was dishonored."

XIII.

1. "Nations are *slaughtered* in their sacred struggle for the rights of mankind; whosoever dares to confess himself to be a champion of liberty, that is to claim his right as a human being, is outlawed; he is declared a rebel. That is the brotherly love of Christianity."

7. "Man is paid to become a murderer of his fellow-men, to turn even his arms against his fellow citizens, if they are generous enough to maintain their human dignity, and the murderers are rewarded by the Christian princes, and the Christian priests blaspheme Divine Providence, by offering their prayers of thanks after a successful wholesale bloodshed."

11. "The Christian religion has become, by the instrumentality of the priesthood a stumbling-block for all honest men."

13. "The state of mankind, under the influence of mock-christianity, as a monopoly of despotism is a satire upon nature and reason, a caricature of Divine Providence."

XX.

1. "Woman exerts the most powerful influence on education, that is upon the destiny of mankind."

3. "The child receives the first impressions, the first rudiments of education from the mother, grows up as boy or girl under her direction, and on entering into manhood, man comes anew under the influence of the female sex, is bound to her by the ties of love."

5. 6. "Woman is gifted by nature with dispositions and faculties, which entitle her to share with man moral independence, and rational liberty."

7. "But woman has sunk into slavery, it has become the property of man; it has become a kind of chattel, that is sold for money by parents and relations."

XXII.

1. "Education, instead of promoting morality and virtue, promotes in our days corruption and vice."

5. "The education of the fair sex aims to make of woman a kind of fashionable, dancing, singing, novel reading, love letter writing, dressing, and child bearing automaton.

6. "Provided this automaton is possessed of pelf, it is regarded as a pattern of womankind, and becomes the wife and mother of slaves.

7. "If such a mother teaches the children to learn hymns and prayers before they are able to think, if she is careful in preventing them from having any intercourse with children of the less wealthy class; if she shows herself well dressed at the tea table, surrounded by well dressed puppets, such a mother is an exemplary woman.

8. "Such an excellent mother has laid the foundation for the happiness of her children, and has the joy to see her daughters married by some worthy gentleman, that is by some wealthy one; and her sons placed honorably in some of the military or civil offices of the state, provided they be not carried away by the bad doctrines of the freethinkers and liberals.

9. "It is to be wondered at that the human race is not sunk lower, if we reflect in what state of moral nothingness the female sex has been condemned to live."

XXIII.

6. "As long as womankind does not acknowledge her dignity, the whole of mankind will continue to live in slavery.

7. "A woman that develops her moral sentiments, and interests herself for the destiny of mankind, is laughed at as one who is not right in her mind, and concerns herself about subjects which are out of the sphere of woman's comprehension."

11. "The duties of woman are different from the duties of man, but as a rational being, both man and woman have an equal right to moral independence, and equal duties to perform towards mankind.

12. "In spite of the bad circumstances in which woman is placed, still woman is the most sublime work of creation, and daily examples show how woman excels man in morality, power of mind, constancy, and courage.

13. "The development of the human species would be wonderfully quickened, if woman would take that place in society from which she has been excluded in opposition to the laws of nature and reason."

The above is enough to show the tendency of the whole work. It is a remarkable occurrence, and it is a token of the working of a general reform in our social arrangements to see how similar ideas are promulgated from so many different quarters. We are glad to see in Harro Harring a new high-gifted champion for the cause of progress. PHILOGYN.

MAMMON;

OR, THE SIN OF COVETOUSNESS IN THE CHURCH.

A Prize Essay.—1836.—Just Published.

SOME time ago Dr. John Tricker Conquest, M.D., F.L.S., announced a prize of one hundred guineas for the best essay on the sin of covetousness; the prize to be awarded to that which possessed the most scriptural character, and made the finest appeal to the feelings. It was evidently a bait for the clergy—and a successful bait it was, for 143 competitors sent in their manuscripts, from which the Rev. Dr. Pye Smith, and Rev. Baptist Noel selected that by the Rev. John Harris, now published as Dr. Conquest's Prize Essay.

The following extract from the original advertisement is curious and characteristic:

"Many of the wisest and best of men are of opinion that there is no sin so prevalent amongst professors of the Gospel as the *love of money*; and yet there is no subject upon which so little has been written well. The late Andrew Fuller says, 'it will in all probability prove the *eternal* overthrow of more characters among professing people, than any other sin; because it is almost the only crime which can be indulged and a profession of religion at the same time supported.' *One hundred guineas, besides the profits of its publication* will be presented to the author of the best essay on the subject," &c.

This is the old proverb to a very title, "set a thief to catch a thief." It was a curious conceit in Dr. Conquest to employ "the love of money" to write against itself. For what motive could Mr. Harris and the 142 competitors have in competing for the prize and the profits of the sale but that very motive which they were hired to decry. If covetousness was so prevalent in the church, why employ a parson or a churchman to write against it? why make the book so exclusive that it must be *scriptural*? why fetter the mind at all? Surely it matters not how the sin of covetousness be destroyed or attacked. The destruction of sin is the main thing, the manner of destruction, except to a narrow and sectarian mind, is of little moment.

Never was money more foolishly expended. If little has been written well on the subject, it is because the very premises are false, and the whole doctrine as taught and practised, an absurdity. Money is wealth, and wealth is prosperity. Does not the church pray that peace may be within our walls, and prosperity within our palaces? Does this imply that the aristocracy alone are entitled to wealth, and that the poor man ought never to aspire to it, or does it mean that prosperity national and individual—that wealth national and individual are blessings to be prayed for and gratefully accepted? Paley has taken a more common sense view of the subject, when he represents the love of money as the most powerful stimulus of human society—the parent of science, of civilization, and the arts. Nay! we are

indebted to this very *vices* for some of the finest institutions of our country, those institutions which the clergy hold up as the greatest monuments of Christian charity, endowed by money hoarders, when death had summoned them to their long home, and they could no longer worship the little idols which they adopted as their household gods. What was Guy but a lover of money? what was Day but a money maker? and pray what was Dr. Conquest but an ordinary restaurateur who prescribed pills, draughts, plasters, tonics, and alteratives, *for the love of money*? and what is the Rev. John Harris and the 142 competitors but pious Christians, who for the love of money wrote 143 scriptural and orthodox essays *against* the love of money?

It is very funny—but so it is. Some austere noodles might say it is very deplorable—we see nothing deplorable in it, it is ridiculous.

So much for Dr. Conquest's prize essay. We have not read it. It may be good or bad for ought we know; but those who have most occasion for it will not *buy* it. And if any miserly selfish professing Christian should *read* it, he will find a sedative for his conscience somehow. He will make a vow of a bequest to the Bible or Missionary society, or some charitable institution; he will tell the Lord he *means* to do good with his money in the end, and in the midst of wealth he will live in poverty, and thank God that he has enabled him to mortify the flesh with its affections and lusts.

In the mean while religious and moral instruction is sadly confused, for on the one hand the parson is preaching against the love of money, and on the other, recommending the poor to save all that they can, and deposit it in the savings bank; nay, he even calculates the amounts of accumulation by compound interest to allure his disciple into covetous and parsimonious habits; at the same time he sings with the most sanctimonious and dolorous melody,—“My brethren love not the world nor the things of the world.” “The love of money is the root of all evil.” Well might Dr. Conquest say no good thing has yet been written against the love of money.

We shall show in due time that it is the division, the sectarianism of society, that is the root of the evil.—To attack the love of money or selfishness, or covetousness directly is pure fanaticism. Principles of a deeper nature must be attacked before these *superficial* vices can be destroyed.

Meanwhile we wish the Rev. Mr. Harris joy of his *hundred guineas*, and trust the *profits* of the publication may amply *compensate* for the labour bestowed on the important subject.

It may puzzle our readers to understand how the umpires could come to a decision upon the merits of 143 large octavo volumes! We shall deliver them at once from their perplexity by stating that it was only after fervent prayer to God to direct them, that they gave their verdict. The possible value of this prayer may be estimated from the following article taken from the Church of England Magazine, No. 2:

"BISHOP PORTEUS—The following anecdote is taken from Sermons on the dangers and Duties of a Christian, by the Rev. Erskine Neale. "There are parts in our professional career," said the venerable Mr. L—y, "which teach us great humility and deep distrust. Talking of a clergyman's experience, there is a fact connected with my own, which has often recurred to me, and never without creating painful reflections. I was, for many years curate of a church near London. One of our congregation a lady of boundless benevolence, and of the most genuine, though unobtrusive piety, had a son, who was a prisoner at Verdun. She was a widow, and he an only child. It was her wish that he should be steadily remembered in the prayers of the church; and for thirteen years, after that beautiful petition in our liturgy, 'that it may please thee to shew thy pity upon all prisoners and captives,' did I offer up a special intercession for him. During this interval, Bishop Porteus came to the church. The circumstance struck him, and he inquired into the particulars. On learning them, he observed, 'If the young man ever returns, I should like much to know his character and fate.' After an interval of three years the bishop again visited our little sanctuary, recollected the circumstance, observed that the clause was omitted, and inquired the reason. I gave it with pain. This child of many prayers had been restored to his early home, a thoughtless, selfish profligate; he had wasted in debauchery

and excess the means of that mother, whose every thought, and prayer, and hope and wish, had had a direct reference to his return; and finally had compelled her, in the evening of her days, to throw herself upon the bounty of her friends. Of the intermediate stages of wretchedness that the son passed through, I can say nothing; but this I know was his end: he was found dead one Sunday morning on a brick-kiln. 'How often, was the bishop's reply, 'do we pray for what proves a curse, and not a blessing! How many amongst us are Israelites! They, dissatisfied with God's governance, asked for a king. With what chastisements, penalties, sufferings and scourges, was their darling desire accompanied!—You speak, however, of the mother as still living.—Give me her address.'"

Review

MISSIONARY LABOURS IN THE EAST.

An Exposure of the Hindu Religion, in reply to MORA BHATTA DANDEKARA, &c. By the Rev. J. WILSON, of the Scottish Mission, Bombay. Printed at the American Mission Press, Bombay, 1832. 8vo., pp. 159.

THE efforts of Protestant missionaries to convert the adult natives of India have been notoriously unavailing, nor is it difficult to account for this fact. We have only to imagine the success which the Brahmans of India would have were they to come over here, and endeavour to make Hindus of us. To be sure, if our government would permit them to establish schools in the British dominions, as the English do in India, they might bring up a few children in the observance of the forms and ceremonies of their religion, just as the English can manage to bring up a few children to read the Bible, and to put on sanctified faces on the Christian Sabbath. However, we do not mean to say that Christian missionaries do no good in India, and the other parts of the world, where they intrude themselves and their doctrines; far from it: we mean only to say, that they are working in the dark; and just as the false and exciting descriptions of Eastern countries, written by Marco Paolo, and others, are said to have urged Columbus on to that enterprise which led to the discovery of the new world of America, so the visionary notion, imbibed by proselyting Christian sects, that it is their bounden duty to look after the salvation of the souls of the Heathen (as they please to call them) will ultimately lead to the discovery of the new world of liberty and knowledge. We purpose to investigate hereafter, in the pages of the *Shepherd*, the collateral beneficial effects which religious missions, Bible societies, &c., have had upon mankind. For the present, however, we will allude to one only of the benefits which the religious zeal of the present day involves in its operations, namely, discussion, agitation. There is nothing like controversy for eliciting truth, and thereby leading to advantageous reforms in the institutions of society. It is not often, however, that missionaries meet with so formidable an opponent as Mora Bhatta Dandekara, or that so useful and interesting a controversy is elicited as that now under our consideration.

It appears that while residing at Bombay, in February, 1831, Mr. Wilson received intimation from a Hindu *shastri* of that place, that one of his friends, Mora Bhatta Dandekara, conceiving that he was able to refute all the objections which had been brought against the Hindu religion, was desirous of opening a public discussion with Mr. Wilson on the subject. This proposal being assented to by the latter, the debate was forthwith opened. It was attended by a great number of Brahmans, and other respectable natives, and was continued during six successive evenings. It is stated that good order was preserved throughout, and that the Brahmans were the first to solicit a cessation of hostilities.

Mora Bhatta intended to have published an account of this debate; but the difficulty of preserving fidelity led him to adopt another expedient in defence of Hinduism. After the labour of a few months, he produced, in Mahratti, a "Verification of the Hindu Religion," challenging Mr. Wilson to make a reply. The reverend gentleman accordingly writes his "Exposure," in English and Mahratti, prefixing to it a translation of the Bhatta's tract. From this last we shall extract as many pas-

sages as our space will admit, and thereby enable our readers to judge of the advanced state of mind on religious matters to which the educated natives of India have attained. Of this advancement we shall probably take another occasion to dilate in these pages.

Mora Bhatta begins by remarking that—"Of whatsoever religion a man may be, he is certain that by that religion he will be saved. People of another religion may come and say a great deal; but no one, on this account, will forsake his own religion, and embrace theirs. On this subject, therefore, let books be written and published,—of what kind, and by whom they may, it matters not. But among the Hindus learning has been gradually decreasing; an ignorance of the nature of religion, and of the marks of its truth or falsehood, has been more and more prevailing. At such a disadvantageous time, were we to remain in silence, making no reply to what people of another religion have published, the most serious evil would, in no great length of time, be the consequence. It is on this account that I write this tract: of the truth or falsehood of its statements, let God himself be judge.

"In the little Mahratti books which the Christian priests are at present in the habit of writing, the principal subject treated of is generally idolatry. As God has no distinctive form, they reckon it a piece of absurdity that the Hindus should esteem an image to be God, and worship it as such. This subject, therefore, in the first place, must be fully considered. Now, there is not a single Hindu who esteems an image to be God: every one perfectly knows there is but one God, and that he is without form, and all-powerful. Why, then, worship an image, it may be asked." Among other replies to this question, Mora Bhatta says—"That God is like the image, no one imagines; but, merely forming such a conception, he spends a short time every day in its worship, and thus acquires peace of mind. This process having been continued, the true knowledge of God is at length attained, and the mind is separated from the world. Then it is that observances are seen to be of no use, and are quitted of course. In the sacred books, also, directions are given for their abandonment in due time and manner, and this abandonment has been effected by many."

How strikingly analogous is the passage we have marked in italics to the saying of Jesus—"Now I pray the Father for you, but the time cometh when I shall no more pray the Father for you, for the Father himself loveth you." And what does this mean, but that when mankind shall be wise enough to act righteously—not from the fear, but from the love of God—then their perturbed consciences will not impel them to deprecate His anger; but they will cheerfully submit to His dispensations, and constantly rely upon His fatherly care. Children supplicate their parents—men do not.

After giving various other reasons why image-worship is prescribed in the Hindu religion, the Bhatta remarks, that similar expedients are used in other religions. He says—

"Among Mussulmans only one God is spoken of. While this is the case, they put their confidence in those men who have been distinguished by their wonderful achievements; and they tell us that by this means their minds are the better drawn towards God, and fixed upon Him. So with respect to several of their observances, which appear so like those of Hindus, the purport of their remarks is this: That they are useful in bringing the mind to the purely spiritual God, as its ultimate object. Among those who hold the doctrine of Christ, one God is first set forth; afterwards, this same God, with a view to the salvation of the creature, that is, its deliverance from all attachment to the visible world, and its attainment of a state of fixed contemplation of the spiritual God, is represented under three forms, which are respectively denominated Father, Son, and Holy Spirit. These forms, viewed independently, differ exceedingly from each other, and that which is distinctive of each of them, cannot for a moment be tolerated, if applied to the one true, invisible God, who is endued with supreme excellence, replete with all qualities, and possessed of all power. As, for example, the Holy Ghost purifies the hearts of men, that is, of those that embrace that religion. He is, indeed, said to be without form or figure, like the Father; but, in reality, his forms are many and various. Sometimes he becomes like a pigeon (dove); at

other times he becomes like fire. When we look to the Son, we find that he is sometimes in the form of word." [In a note here, Mora Bhatta refers to the oft-controverted verse of St. John, which he thus quotes—"In the beginning was word: that word was in the heart of God; and the same word was manifested in the world in the form of Christ." Mr. Wilson observes on this note, that the sentence, in so perverted a form, is not to be found in any of the Maharrati translations of St. John's Gospel: it must, therefore, be considered the Bhatta's own reading.] "Having thus assumed a body, he is brought into a state inconsistent with the greatness and glory of God—a state open to reproach, and altogether incongruous: he is born in the womb of a mother; he becomes a youngling, like any other creature; he experiences the good and ill of mortal existence; he suffers in like manner the punishment of a malefactor, and dies a reprobate death: by these and other means he procures the favour of God, and thus accomplishes the salvation of men. Those who hold these doctrines, maintain that, while all these things are done, and all these forms assumed, the unity of God is undestroyed, and that to him there is a large revenue of glory. This is *their* avowed belief. If then, these three Divinities occasion no bewilderment of mind, but establish the creature in the worship of Rāma, why should Krishna, and other gods, occasion an ever-growing bewilderment to us? By means of their worship why may not the mind acquire the power of fixing its contemplation on the purely-spiritual, formless, all-sustaining, and infinite God? You will say that these gods are worshipped by us through the medium of stones, water, trees, and animals, and thus lose their greatness and glory. I answer, that through the medium of these things, they have in love manifested themselves to men, without any loss of honour; and how, then, can any such loss arise from their being worshipped through the same medium? If the loss complained of really be experienced, then why should God command us to worship him in this manner? In saying that the intoxicating juice of the grape, the grain that springs from the earth (bread and wine)—in saying that these things are part of his body, if God is not dishonoured then how can his honour be tarnished by saying that fire, the cow, the *shaligram* (sacred black stone), and other things so holy and purifying, are his very glory. * * * On this subject we refer you to that Jesus Christ whom you acknowledge your saviour, and who is therefore all-knowing. *He will take our side of the question, and afford you all the satisfaction you require.* * * * Why should he tell you to meet together from time to time, to take a piece of bread, and muttering a few words to eat it up? and why should he order you to drink spirits? [Surely this word might have been translated 'wine!'] and why should he enjoin you to pour water on the head? Alas! the bread, the spirits, and the water, are all material things; and yet, in spite of this, Christ urges it upon you to observe these ceremonies, and he who does not observe them, but merely reposes confidence in Christ, is not his worshipper, and no one calls him so." * * *

A little further on, this Hindu philosopher—for he well merits the appellation—says: "Our opponents are accustomed to ask, When did Krishna perform any good deeds? In his behaviour, say they, there is nothing but sin; not a particle of righteousness is to be found. We answer, that this is not the case with him alone. Of all the numerous gods, which have sprung from one God, and yet are no more than one God (in the same manner as, though there are severally Father, Son, and Holy Spirit, there is but one God), of these the procedure resembles a good deal that of Krishna:—Krishna's committing theft with the cow-herds, and playing the adulterer with their wives—Shiva's spreading death and destruction by his curses, and behaving indecently with Parvati—Brahma's looking on his own daughter with the eye of a paramour, and making a most filthy disclosure of his lust—Rāma's crying out '*Sila, Sila!*' and embracing the trees in a fit of frenzy—Parashara's cohabiting with a fisherman's daughter—Such abominable transactions as these are too bad to be even mentioned. Are these, you will say, what you adduce and place on a level with the good acts of Christ?"

We regret our space will not permit of our following the Bhatta in his ingenuous answers to these formidable questions: we must, however, give a specimen. He states that, "From

Parashara's adulterous connexion with the fisherman's daughter there sprung a son, whose praise is in all the world, who accomplished the great work of collecting and arranging the *Vēdas* and *Shāstras*. Such a son could never be produced in a marriage connexion, however distinguished by excellence and purity." * * *

[The ancestors of Christ were incestuous and adulterous.—Judah gave birth to the whole tribe of Judah by the aid of his own daughter-in-law; and David continued the genealogy of the Messiah with the assistance of Bathsheba, the wife of Uriah. The wisest of men was the fruit of the union.]

Some of the actions of the incarnations, remarks the Bhatta, show that certain things done by them are to the human view productive of much evil to them, and are therefore useful in setting an example of virtue, and in deterring from vice: and if the Christians should think that the Hindus are likely to say within themselves, "These things have been done by the great, why should not we do them." * * * To you, we would remark, that the conduct of Jesus Christ has laid open the way of wickedness to man. If you ask how this is the case, we reply, that Jesus Christ tells you only to believe in him, and promises, on this condition, to take on himself all your sins, whether old or new, and thus accomplish your salvation. Will not men, who are spontaneously given to sin, on hearing such a promise as this, believe in Jesus Christ, and prepare themselves to commit sin up to the full extent of their desire? When we tell you this, you will cry out, 'No, no; you mistake altogether the meaning of the words, *believing in Christ*. To believe in Christ is to obey his commandments: he that obeys, he it is that believes; otherwise, faith cannot be said to exist.' Will not, then, the servants of Krishna, in obedience to his commandments, refrain from those actions which are, in their opinion, wicked? If you ask why Rāma, Krishna, and the other incarnations, accomplished the salvation of men in this or in that particular manner, we ask you in return why God sent his Son into the world? and why, for the salvation of man, he brought him into a state so reproachful and so appalling? What! had he no other way of saving the world? We reply, that God is omnipotent; and that, by saying he had no other way of saving men, you fix an indelible stain on the glory of his infinite power. After bringing into existence principles and objects productive of sin, the moment it is produced and makes its appearance in the world, he must become a man, a pigeon, or fire; he must submit to unheard-of sufferings! Why, pray, should he put himself to so much ado? To this, if you reply that He did what seemed good to Him, then you say precisely what we say ourselves—that *Krishna and others did for the salvation of the world what they thought fit.*"

The following passage is an admirable lesson for religious intolerants:—

"We do not seek to overturn the doctrines held by any one; for, as God has consulted the convenience of all people on the face of the earth, with respect to food and clothing, so, for the inhabitants of different places, has he laid down different doctrines, with a view to their salvation. Those doctrines, therefore, and those alone, according to which they severally worship God, are to them true. According to the nature of these several doctrines do they severally obtain reward from God."

We might search the writings of all the fathers and divines in Christendom, and not find a more liberal and truly philosophic sentiment than is here expressed by what the missionaries would call a *poor benighted heathen*.

We have already exceeded our limits; but the passage quoted below is so in accordance with the opinions of the Universalist that we must make room for it:

"A certain Christian priest makes the following remarks:—'God is the Father of all mankind; and no father gives opposite laws for the government of his children. God has given one law; and therefore there is but one true religion, and one true written rule of religion; in the same manner as there is but one sun for this earth.' For this earth, indeed, there is but one sun; but in the universe are there not many suns? How can the light of one sun reach those fixed stars which are at an inconceivable distance from it? That they shine by their own light must be allowed on all hands. If a man have two sons,

the one wise and the other foolish, will he give them rules according to their respective abilities, or will he give the same rules to both? *Although he should prescribe to them different ways, according to their talents, yet his intention is one, and that is, to make both wise. The same is true of God in his dealings with men.*"

We do not think it necessary to state Mr. Wilson's arguments in reply to Mora Bhatta's "Vindication of the Hindu Religion." Our readers may very easily imagine their nature. We are ready to give every credit to him for the very candid and open manner in which he has come forward in defence of his tenets; but we must say that, in our opinion, he has completely failed in rebutting the reasoning of Mora Bhatta.

CLERICAL CORRUPTION.

ECCLIASTICAL COURTS.

THE principal Ecclesiastical Court is the Prerogative Court, which takes cognizance of all property disposed of by testaments as also of all intestate property. It is therefore by no means a spiritual or sacred court, but one of the most temporal and profane courts in the country. The number of wills registered in the Prerogative Court of Canterbury, Doctor's Commons, is between six and seven thousands yearly, and they have increased twenty per cent within the last twenty years, at an average of one per cent. per. annum. The business of the court is therefore rapidly increasing, and the fees, emoluments, and baits of the clerical vultures in the same proportion. The Court is metaphorically speaking a carcase or charnel house. It contains the property of the dead only; it was a prophetic saying of the great founder of Christianity that whosoever the carcase is, thither will the Eagles be gathered together. Let us see what sort of eagles we have got at this Ecclesiastical Court. We extract from the report of the Ecclesiastical Commission of 1832.

The principal registrars are three clergymen. "Do the principal registrars perform any of their duties in person?" (*Nathaniel Gosling (deputy registrar)* No. 8. How do they perform their duties? They appoint three deputies. Are those deputies assisted by inferior officers and clerks? Yes! What were the gross and net amounts of the receipts of the principal registrars in the year 1827, as returned to the House of Commons in 1828? The gross amount was 15,490*l.* 14*s.* 1*d.* The disbursements of that year were 7,090*l.* 3*s.* 4*d.*, leaving the net amount of 8,400*l.* 10*s.* 9*d.* Is it out of the net amount you have stated that the deputy registrars are paid? The sum that is paid to the deputy registrars is included in the article of disbursements, (namely clerks salaries, pens, ink, binding, and printing, filing wills, carpenters bills, rent, land tax, and assessed taxes, &c., &c.); leaving a net amount to the principal registrars of 8,400*l.* 10*s.* 9*d.*, after the payment of all disbursements.

Are the principal registrars competent to superintend the duties of the different officers in the Prerogative Office? Do they understand the nature of the business? No: they are gentlemen of high respectability, (*high churchmen*), but it is impossible they can know anything of the business of the office, that is only to be known by close attendance. *They now and then come and see how every thing looks in the office.*

Who at present fill the situations of clerk of the seats? No. (1), held by Mr. John Capes, No. (2), Mr. George Bridges Moore (3), Mr. John Askew, and Mr. William Abbott, jointly (4), Mr. John Moore, (5), the deputy registrars.

Are either of those persons, except the registrars, who fill those offices, competent to discharge the duties of them in person? There is one of them who *could* be competent but he resides at Canterbury and the other three are not professional men. Are not the emoluments of the clerks of the seats very considerable? They are very large. According to a Parliamentary return, it appears that Mr. John Capes after paying his deputy or assistant clerks has a sinecure of 1,485*l.* 13*s.* 4*d.*, himself not being competent to discharge the duties of the office? Certainly."

(Pious gentleman! none of your agitators and malcontents! but a highly respectable *high churchman*!)

Formerly the clerks of these highly respectable gentlemen

used to be paid by gratuities levied from the public, but lately these gratuities have been abolished by Act of Parliament. The incomes of the assistants and clerks have therefore been much reduced. The incomes of the sinecurists increase with the business of the court!

This corruption of the clergy is further aggravated by the extreme difficulty there is in displacing a clergyman from any spiritual pasturage, when once he has taken legal possession. In ancient times the ecclesiastical discipline was very summary. It was then really episcopal, and the Bishop had the power of suspension and deprivation according to the nature of the offence. But since the Reformation, the discipline has been so much relaxed, that the Ecclesiastical commissioners (1832) state in their report that they are not aware of any instances in which it has been enforced since the Reformation. The same corruption has crept into the Scotch Church, in which the self government system, very erroneously styled republican by many, has thrown a rumpart around every Presbyterian manse, which protects the consecrated tenant from the just retribution, that ought to be inflicted on every man who fails to fulfil the moral obligations, for which he is supported by public bounty. A drunkard may hold a Scotch benefice, till his congregation forsake him: and then he may sit down, and chuckle over the happy riddance he has experienced. This comes of self government, and divided responsibility. Were a Bishop endowed with the power of discharging such monsters, and responsible to public opinion for the exercise of his power, there would be fewer instances of such immorality to shock the moral feelings of the nation. Both the English and Scotch Churches have departed from Episcopacy, which is really a simple and natural form of government. In the beginning of the 18th century, Bishop Gibson attempted to revive the ancient discipline, especially against non-resident clergymen; but the trick and established usages of the Ecclesiastical courts prevailed against him. It is now so very difficult to proceed against clergymen for any immorality, that they are generally allowed to exercise almost unlimited discretion in the exercise of their clerical functions. A prosecution when attempted against a consecrated reprobate, lasts in general two years, and is attended with very great expense. One is mentioned by the Commissioners in their report above alluded to, as extending to five years, and costing 1,500*l.* The bishop being generally at the expense of prosecution, the Ecclesiastical culprits repose in safety under the banner of Episcopal economy. When a clergyman is *threatened* with prosecution, the custom is for him to withdraw from his benefice, *appoint a curate*, and receive his tithes and other perquisites as a non-resident. He thus escapes prosecution and deprivation or suspension, by merely adding the crime of non-residence to the list of his other offences.

[Next week we shall give a very edifying discourse of Peter Priestcraft on this subject.]

LIFE AND DEATH.

POPULATION REPORTS FOR 1831.

THE Population Reports of the British Parliament throw some curious light upon the two subjects with which we have headed this article. They begin with the year 1801, and end with the year 1831, so that we have a period of thirty years to speculate upon. In England, marriages seem rather to be on the decrease: the average for 1801 is one marriage annually for every 123 inhabitants, and the average for 1831 is one only for 129 inhabitants. The births are about the same in both (that is, one to 37), and the deaths less frequent (one in 54).

In Wales, which is a mountainous and agricultural country, marriages are increasing, and births and deaths diminishing. The births have diminished fully one-fifth within the last thirty years. The Welsh are the most bastard people in Britain. In Radnor one-seventh part of the children born are illegitimate, whereas, in Surrey (where a large portion of London stands), only one-fortieth part of the children are illegitimate. Middlesex and Surrey (the metropolitan district) are remarkable for legitimacy. There is not a county in England which can be compared with them, and those which approach nearest in this

moral sense are those which are closest to them in an intellectual and local sense. Marriages are also more frequent in Middlesex and Surrey than in any other county in England. This is contrary to the general supposition of people both in town and country; but there can be no doubt that the regularity and consistency of the returns of the Parish Registers nearly approximate the truth. The proportion for Middlesex is one marriage for every 102 inhabitants. Lancaster has one for every 117; Warwick one for every 119. Oxford and Cambridge, too, are very matrimonial! In Wales the average is about one in 150, which is one-third less than Middlesex; and all the English counties which line the borders of Wales seem to be tainted with Welsh propensities, both in respect to bastardy and marriage.

It is remarkable enough, however, that wherever illegitimacy and celibacy prevail most, there is the smallest ratio of mortality. Life is longer in Wales than in England, and births and marriages less frequent. In Monmouthshire (England, but bordering on Wales), the population is progressing more rapidly than in any other county, not excepting Lancaster—it has more than doubled its population in thirty years. Yet in Monmouth the increase does not take place by births, for there the proportion of births is small; but though inhabited chiefly by pitmen, it is the most *healthy* district in the kingdom. Population is encouraged, marriage is encouraged, illegitimacy is encouraged, but still the productiveness of the inhabitants is one-third less than the average of the other English counties!! Lancaster is more matrimonial, and more mortal, and more productive, but more illegitimate. This latter fact seems an exception to the rule, for illegitimacy generally prevails most in agricultural counties; but there is an obvious reason for this illegitimacy in Lancashire (being one in 13 births, the average for Wales). In that county there is an immense number of children employed in the cotton factories, the proportion of women and children being greater than that of men. This, to people of no education or refinement, is rather a premium for re-production; moreover, the proportion of uneducated persons in Lancashire is about the maximum for England. The manners of the people are less polished, the communion of the two sexes is more promiscuous, and the employment more servile, than in other populous and manufacturing districts. Servility has always a tendency to promote illegitimacy.

Upon the whole, we conclude from an examination of three large folio volumes of evidence, with which we have been amusing ourselves for several days past, that civilization, in the highest sense of the word, has a tendency to promote marriage and legitimacy, whilst celibacy and bastardy belong principally to those districts whose population is scattered as agriculturists, or reduced to a state of servility, by the autocracy of commercial capital and manufacturing monopoly.

It is a false notion, therefore, which many entertain, that marriage was more frequent in ancient agricultural, pastoral, and roving times, than at present. Marriage is most prevalent in highly-civilized and wealthy countries, where men act independent, as tradesmen, mechanics, artists, &c., and are not merely the hired labourers and the day-boarders of land-owners and farmers. If marriage has latterly rather decreased, to a trifling extent, in England, and increased in Wales, it is owing to this that the manufacturing and commercial system in England has of late come to a crisis, and is undergoing a revolution, whereas, in Wales, the progress is going continuously and uninterruptedly forward towards the advance-guard of modern civilization.

It is difficult to sum up the evidence on such a complicated and intricate subject as this; but we shall, before concluding, at present remark, that increasing ratios of births and mortality seem to go hand in hand; thus suggesting the idea, which, perhaps, at some future period, we shall more fully develop, that in future generations the ratio of births will still more and more decrease, and population will increase more by the aid of health and longevity than by generation. Such is the tendency of human progress, viz., a revival of Antediluvian times, or simple nature improved by the experience of ages of folly, experiment, and discovery.

The inference we draw from the preceding facts in favour of universalism, is as follows:—

There is a marriage for every death, that is, for every couple of deaths there is one couple married.

The preponderance of life over death is as three to two. There are three births for every two deaths, and the proportion of life is increasing whilst that of death is decreasing.

The principle of LIFE, therefore, is stronger than that of DEATH.

We have chosen the principle of life as the basis of our faith—Atheism is Death Universal—Pantheism is Life Universal.

We have found an analogy of three to two in our favour in the progress of society: we shall show still greater and better analogies as we proceed.

PHRENOLOGY, ASTROLOGY, & PHYSIOGNOMY.

A little work has been published, a few days ago, upon the harmony which subsists between Phrenology, Astrology, and Physiognomy. A small diagram represents a Phrenological head inserted within an Astrological horoscope or nativity, and the different houses in the heavens are shown to correspond in character with the phrenological faculties. As an incipient attempt, it is at least interesting. All attempts at scientific harmony, whether they fail or succeed, are useful for the establishment and consolidation of standard truths; for the detection of error is as useful as the discovery of truth. We must remind our readers that our universal views lead us to the UNIVERSAL AND STANDARD FACT that no science, studied individually, can teach truth or make a man other than a sectarian and a bigot. The mere phrenologist is as lean a fanatic as the Astrologer. Phrenology is fast becoming a quackery, not because there is no truth in it, for there is truth in it, but because in science there is at present quite as much sectarianism as in religion. Having found a few striking facts in a province or department of nature, the sectarian philosopher shuts himself up within it, and dictates universal truths, as he calls them, from particular facts. In Lavater's days all mind was discovered in the countenance; in Spurzheim's it is all seen in the skull, and some ladies and poets will tell you that the eyes alone are sufficient. The astrologer says the stars only can unveil the secret. The latter will read your character and destiny for so many shillings; the Phrenologist will tell you your propensities, and the sum total of your intellect for as many more. The ladies and the poets will read you for nothing. According to the vulgar notion of quackery, there is no suspicion attached to the ladies and the poets, for they do not make a charge—the money is the test. But what say the phrenologists to the fact, that it is now become a *trade* to read heads? We say, it is no disparagement to Phrenology that men can live by it. It is rather a recommendation; but the world is not so generous as we are, and the Phrenologists themselves are not more generous than the world, for they condemn the astrologer for making a charge for his labour, and they raise a deuce of a noise when even a hint of quackery is suggested against them by the same spirit of liberality as their own. Every man and every party deserve to be treated as they treat others. We have seen written phrenological judgments or nativities for which seven and sixpence were charged, and we lately heard of one party of young men who went to a Phrenologist in London and paid that sum each—four or five in number—a goodly afternoon's job for a burzologist. Had these same young men given their money to a man of trines and quartiles, they might have been ridiculed as fools, and he imprisoned as an impostor. What is the test of imposture?

A curious question, who can answer it?

Should this union of Astrology and Phrenology actually take place, it will constitute a curious marriage between heaven and earth, or high and low life. We hope it is ominous of something similar in political society.

COMMENCEMENT AND PROGRESS OF SECTARIANISM.

Few men are aware of the magnificent revolution which has been going on in the intellectual world for the last forty years. It is so rarely even alluded to amid the frivolous gossip which occupies the study of the bulk of mankind, that it cannot be expected to find its way into the minds of those who are indebted for all their materials of thought to the ordinary purveyors of the public press. Nor is it possible for one individual to take so comprehensive and clear a view of this important renovation of opinion, as to portray that imposing spectacle of unity and design which, at no very distant period of time, will start into view before the now blinded world.

Men are not only tending to Universality of religious opinion by the preparatory process of liberalism, scepticism, indifference, or infidelity, which are so many different stages of discontentment, through which the human mind naturally passes in its translation from a worse to a better system of opinion; but, at the same time that they are thus tending forward to a common centre, they are also looking back amid the mists of antiquity, and discovering numerous arguments of a powerful character to convince them that such a union once existed in the world at a former period.

Thus Universality seems to stare us in the face, whether we look back to the primitive ages of human history, or forward to the future development of civilization.

The relationship which subsists between all the languages of the world is daily becoming more and more apparent. We can almost already trace them to a common parent. Sanscrit, Greek, Latin, Celtic, Welsh, Irish, and all the European languages, have numerous words which are similar in sound and identical in meaning. Colonel Vallancey has already sufficiently proved that the celebrated Phœnician sentence, preserved in the *Pœnulus* of Plautus, is pure Irish. Here it is, with the Irish along with it. The reader may judge for himself:—

PHOEN.

Nith al o nim un lonuth seomathessi macom ayth.

IRISH.

An iath al a nin unillonac seoruidh se me com sit.

PHOEN.

Chin lac chunyth mumys tyal mychthii barri imi schi.

IRISH.

Cim laig cungan muin is toil mo iocd bearaid iarmo sgil.

"Oh! mighty splendour of the land, let him quiet me with repose.

Help of the weary captive, instruct me, according to thy will, to recover my children after my fatigue."

However numerous and varied the branches be, it is very probable that the original root or stock of all the languages of the world is the same.

But this is credible enough, in comparison with an idea which has been very elaborately and learnedly maintained by a Mr. Jervis, in India, in a work lately published upon the subject—that all the weights and measures throughout the known world can be referred to a common standard. That standard is the pendulum vibrating seconds at the mid-latitude of 45 degrees. This standard he ingeniously applies to weights and measures of capacity; and from a single passage in the Old Testament, which many have sneered at as betokening ignorance in the writer,

he has ascertained the different weights and measures of the Jews, to a grain and an hair-breadth. From the Ganges to the Shannon, from the Equator to the Poles, he has compared the different weights and measures of all nations, and found them all to be multiples and proportionals of the everlasting natural standard—the pendulum vibrating seconds in the latitude of 45 degrees.

This is a powerful argument in favour of Bailly's theory of the existence of a primitive nation of Hyperboreans in a latitude of from 40 to 45 degrees, from whom all other nations have sprung, and derived their ancient traditions. These, he says, are the famous Atlantes of the ancients—the fathers of science, of mystery, and of civilization.

In conformity with this idea, the industry of human learning is yearly discovering some new features of common relationship amongst all the religions of the world. The story of "Eve and the Serpent" is found amongst the relics of Buddhism, in India, and of "Tuath de Danaism" in Ireland. It is a universal tradition, incorporated one way or another with every known religion. The crucifixion of Budh, of Chrishna, and of Christ, their resurrection, and ascension into glory; the Virgin and the Child; the Lamb of God; the Passover; the institution of that festival at the entering of the sun into the constellation of the Ram or Lamb; Baptism, regeneration; and, in fine, all the distinguishing features of revealed religion are universal ideas, to be found more or less corrupted and bewildered amongst all religions. Nay, even the very holidays, festivities, games, and superstitions of mankind, have a common origin, and are shrouded in mystery, in the great source of all mundane theology, the Buddhism of India.

There can be no doubt that Buddhism has been spread over all the world. In ancient times, as we read in the *Asiatic Researches*, and other works upon Oriental history, the universal faith of mankind was destroyed by a formidable contest between two great parties—the one asserting that the male, the other that the female principle of generation was the most powerful. They fought, and slew one another. Sometimes one party prevailed and sometimes another; but a universal scattering took place, and many tribes emigrated westward, and founded the celebrated systems of mythology which have prevailed in these Western regions. The male and female nature were styled Lingam and Yoni, and pillars were consecrated to the one and caves to the other. The round towers and the mithraic caves of Ireland are relics of the industry and skill of their worshippers.

This controversy between the male and female Divine Nature is a very curious phenomenon. It is still kept up in the world, unknown to those who continue it. God, the male, throughout all the Christian world, has been at variance with Nature, the female. The Jews have never acknowledged the female Deity, the material counter-part of God. Those who have acknowledged this mother God, have invariably been addicted to idolatry or materialism of some sort. The Greeks and the surrounding Heathens all worshipped the bi-sexual Deity, and whenever Christianity received into its creed a resemblance of the married God, it immediately became idolatrous. Mary, the mother and spouse of God, and Queen of Heaven, is but a meagre substitute for Divine Nature. The Catholics adore this mock deity, with the whole congregation of the saints, in a refined system of Christian Polytheism, Idolatry, and Feti-

chism. The Protestants are a species of spiritual Jews, who reject the female in every sense of the word, and worship God the male only.

The Lingam and the Yoni, however, can never be separated. Nature avenges the insult offered to her character. The Queen of Heaven must be honoured along with her husband. This honour, *as it is due*, being refused throughout all Christendom, the consequence is, that the priests, or worshippers of the male, have long been, and now, in an especial manner, at variance with the philosophers, or worshippers of the female. The study of Nature, or science, is in vehement opposition to the study of God or Theology; they ought to be in harmony; the two together constitute truth; truth is to be got from neither; the Lingam and the Yoni are equally defective apart. The Fanatic, the Sectarian, the vulgar Christian, is a follower of the Lingam; the Materialist, the Infidel, the Deist, the Atheist, is a follower of the Yoni, to use the Oriental style of speech. The Pantheist is a follower of both. Nature is now more than ever asserting her rights. The time of the emancipation of the female is at hand. Like the rest of her sex, Nature has not political power. The jurisdiction, the establishments, belong to the male; but her arts, her charms, her industry, her produce, are now more than a match for the conservative spirit of mysticism. A revolution is taking place in her favour, and, ere long, that event which formerly took place in the Eastern world, viz., the reconciliation of the two great opposite principles, will take place again, and confirm the proverb of ancient and royal wisdom, "That there is nothing new under the sun."

True, there is no new principle; the principles of Nature are simple, and few in number, but the modifications are infinite, and the movement of society is a progress in knowledge, in religion, and in morals. The universality of the primitive ages was a universality of simplicity and astrological science. The Catholicism of Christendom was the Catholicism of darkness and bigotry; but the universality of an age of printing and experimental science must be one of a more perfect and durable nature, not to be terminated by any thing short of a universal deluge, or some such all-destroying convulsion of nature.

Still the tendency to and from Universalism is the same double law of nature in eternal operation. Perfect unanimity cannot exist amongst imperfect beings. The nature of man is contentious; but he becomes tired of quarrelling in one particular field. He seeks repose and finds it for a time, that repose at last becomes irksome, he rouses up his faculties with some new subject of discussion, and finds that nature is never at a loss to provide him with new subjects of controversy. The beauty of this progress, however, is, that as men increase in knowledge and virtue, their contentions become less brutal, and those controversies which once were adjudged by an appeal to the Lord of Hosts are finally referred to the God of Reason and discretion.

There is always more liberality and universality in the founder of a religion, than in his followers. "The liberal and benign followers of Brahma," (says Godfrey Higgins, in his 'Anacalypsis') "in its original purity can never be too much praised, and must fill every one with admiration. No doubt in succeeding ages its corrupt and mercenary priests, ingrafted into it, as we see daily to take place in all religions, and wherever priests are concerned, doctrines and practices utterly repugnant to the mild spirit of its founders. Those founders maintained that all religions come from God, and that all modes of adoring him when springing from an upright heart, are acceptable to him. Their enlightened followers still affirm that the deity is present with the Mahometan in the Mosque counting his beads, and equally in the temple at the adoration of the idols; the intimate of the Mussulman, the friend of the Hindoo, the companion of the Christian, and the confidant of the Jew. They are of opinion that he has many times appeared, and been incarnate in the flesh, not only in this world, but in others, for the salvation (instruction) of his creatures, and that both Christians and Hindoos adore the same God under different forms." It is only their persecution by Christian and Mahomedan fanatics that makes them at times think otherwise.

Who could imagine, from reading the life of Jesus Christ, and the early fathers of the Church, that their disciples in the 19th century could have made such a fearful deviation from the spiritual path which was first pointed out to the Christian world,

and that they should have intermeddled so much with temporal things from which they were strictly forbidden?

The Greeks and Romans were very universal in their religious creed. The multiplicity of their Gods is abundant evidence of this. Rome was a Pantheon, a home for all the Deities of the world. Greece was the same. They saw the Divinity every where, and his personification in every thing. It mattered not therefore to them whether it was a bull, a calf, a snake, or a man; there could be no doubt that some one or more of the attributes of Deity must be personified by the image. They followed the Grand Yoni, or the principle of visible nature being a likeness or counterpart of God. The Jews, the Christians, and Mahometans alone—the Bachelors of Divinity—have opposed this universal principle, and cooping up their God like a parrot in a cage, they have made him repeat unceasingly the same mystical harangue which he spoke to the generations of infantine society, and established that as literal truth for men, which was given as a riddle, and which common sense denounces as unfit for maturity of years and understanding.

This Bachelor (unmarried) system of Divinity, which separates God from nature, as the Poor Law Commissioners separate the husband and wife in the palaces of pauperism, is the grand universal exposition of the *Fall of Man* in so far as relates to the supremacy of the male. "Thy desire shall be to thy husband, and he shall rule over thee." The male Deity, the Lingam has prevailed, he has established his throne in all nations, and the worshippers of nature have been tributary to him.

But the Philosophers, the Yonians, are the true mothers of science and art. The worshippers of nature are the mothers of invention. Reproduction in the highest sense of the word belongs to nature. Beauty and grace and all the attributes of female nature shine conspicuously in the Yonian division of men. They have never used the sword to establish their opinions like the worshippers of God. Philosophy, science, and art are gentler than religion. The Lord of Hosts belongs in an especial manner to religion and politics. There the male nature riots and gorges itself with the blood of the slain; there the God of battles dies his garments red, and trends the wine press of his masculine vengeance. Seek the Lord elsewhere, seek him in the chambers of science, of poetry, of painting, and there you find him with his armour cast off, and dallying with his gentle bride. He is all things to all, just as you make him. Seek him in strife, and there you will find him as keen and eager for the contest as yourself; seek him in peace and behold he is there. "If you mount into heaven he is there; if you make your bed in hell he is there also." "With the froward, he is froward, and with the upright he will show himself upright."

It is a fact, whether it is a melancholy fact or not, we cannot say, that in the progress of religion downward, from the Primitive Universality, it has become more and more illiberal exclusive and cruel. The Western religions have become more illiberal than the Eastern, by their departure from Pantheistic principles. Nothing can be more barbarous than the religious wars of the Christians and the Mahometans. It convulses the frame; it thrills the nerves to think of the human sacrifices which have been committed by the followers of Christ and Mahomet. No wonder Christendom is called *Par excellence*, Babylon the great and the scarlet w—e drunk with blood. No wonder it is called the last dispensation of the reign of the Beast, for men could stand it no longer. They have already shown this determination by resolving to cast off religion altogether, and deny the very being of a universal mind rather than contend as hitherto with the fatal devilish spirit of Christian sectarianism.

But this very fact of "Christianity having been the most bloody of all religions is in our estimation, an argument in favour of Christendom. The seat of the Beast is the field of victory, the scene of destruction; it is only where evil is most perfectly developed that it can be most successfully attacked. The stimulus to reformation is stronger here, than in any other part of the world, for on the one hand the remnant of a furious bigotry, and on the other the rising virtues of an ennobling philosophy are in deadly controversy, and we cannot doubt that the charms of nature will at last prevail. "The seed of the woman (Nature) shall bruise the head of the serpent" (Superstition).

NEPOTISM.

A MODER AND EDIFYING DISCOURSE, BY PETER PRIESTCRAFT.

"If any man provide not for his own, and especially for those of his own house, he hath denied the faith, and is worse than an infidel."—1 Timothy, 5, viii.

MY BRETHREN,

A day is foretold in the Sacred Volume when men shall lose their natural affections—fathers cease to provide for their offspring, and children cease to reverence their parents; and this caution is given to you, that ye be not as the children of this world are—men of corrupt hearts and of perverse minds—but that ye follow on in the path of the just, which your Christian ancestors have already trodden smooth for your feet, and on which they have strewed flowers and down, instead of thorns and briers.

God hath made many of you parents; he hath engrafted upon your old stocks the new life of regenerated humanity. Ye have shooted forth branches like the vine; ye have multiplied your own selves in the bodies of your children. Oh! my brethren, what is more precious than self? There is no equivalent for it. What will you gain if you give yourselves for the sun or the earth, or the heaven? All is nothing if self be lost. Next to a man's self are the branches of himself, his second self, and the mutual offspring of the two selves. Oh! how it warms the heart to think of the fond relationships of *blood*! Sweet and pure and strong are the ties of social friendship, of spiritual relationship, of intellectual and moral sympathies; but sweeter and purer and stronger far the friendships, the relationships, the sympathies of *blood*! Oh, blood! blood!! there is something sacred, peculiarly sacred, my friends, in blood. It is by blood we are saved, by blood we are washed, by blood we are purified and sanctified, and regenerated after the image we have lost.

What is the reason why God hath thus peculiarly honoured a material substance, a red substance, and a circulating substance? Ah! my friends, there is something deep in this: it is only by the types ye can see it. Money is a circulating medium; money is red; money is material; and, moreover, money is the life of society, even as blood is the life of man—money is blood, and blood is money. Oh! my friends, listen cautiously, for now we tread upon sacred ground.

And what is the reason why God hath implanted within us so strong an affection for our own blood, so strong an inclination to preserve its circulation within our own veins and the veins of our children? It is to teach the truth, which is contained in my text, that a man ought also to circulate the other blood, which he possesses, amongst the members of his own house, and provide for his own. Even the Infidels do this; but the Christians, and especially the High Church Christians, in a particular manner. This proves their obedience to the Apostolic precept, and affords a powerful argument in favour of an Established Church, ordained by law, and supported by the sword of military glory.

In order to demonstrate this proposition more fully, I shall prove, from the personal obedience of many of our most distinguished prelates to this precept, that they are not men who have slighted the word of truth, nor read it in vain.

To begin with the Right Reverend Father in God, His Grace Dr. John Moore, late Archbishop of Canterbury. In obedience to this precept of the pious apostle, he appointed three members of his own family to the three registrarships of Canterbury, viz., the Rev. Geo. Moore, the Rev. Robert Moore, and Charles Moore, Esq. The two first are still alive; the latter is gone to his rest with the just made perfect. But when he died, the late Right Reverend and Holy Father, Dr. Sutton, then Archbishop, appointed one of the members of his family, a young boy, called Charles John Manners Sutton, who now holds the valuable spiritual endowment of 3000*l.* per annum, with a deputy to do all the business for him. In fact, it is one of the gracious peculiarities of the places conferred by the Right Reverend Fathers of the Church upon their own—that there is little or no labour, but much *blood*.

I am particularly pleased with the conduct of the late Bishop of Worcester, who appointed his son to the registrarship of Worcester, in conjunction with the Rev. Thomas Hill Lowe,

vicar of Grimley, upon condition that Mr. Hill should not receive any of the emoluments of office during the life of the Bishop's own. Observe, my friends, the strict adherence to principle of this pious Father of the Church. Our text enjoins provision for our own. Had the Bishop divided the circulating medium between his own son and Mr. Hill, it would have been tantamount to shedding his own blood, which would have been an awful example from a master and a father in Israel.

Not less gratifying is the conduct of the late Bishop Butler, of Oxford, who generously conferred the office of registrar on the son of the pious and learned Dr. Lowth, not having a son of his own to accept the situation. This worthy man, however, was not content with merely providing for one life, he bestowed the situation on three lives—the first, the Bishop of London's own; the second, Mr. W. Sturges Bourne, of a well-known respectable family, who now holds it; and the third is Mr. George Garnier, who is now looking for it.

Benjamin Keene, principal registrar of Chester, was appointed by his father, the Bishop of Chester. And Bishop Markham, a former Bishop granted the same goodly pasturage of the church, in reversion, to two of his sons, who are now dead.

The late Dr. Barrington, Bishop of Durham, and a princely patron of Christian excellence, granted the two registrarships to two of his sons—the one being only a minor, the other full grown; but as a deputy does all the work for them, the minority or inexperience is of little importance. Moreover, there is a great charitable and Christian principle involved in the system of doing work by deputy; it makes provision for two instead of one. Thus, even the meanest servant of royalty has the advantage of living in a palace, and the revenue of the sovereign is spent by his domestics as well as by himself. These things have been so ordained by the wisdom of our ancestors, and no doubt they are right and scriptural.

I might enumerate many other Bishops, such as the Bishop of St. Asaph, the Bishop of Bangor, the Bishop of Bristol, the Bishop of Ely, the Bishop of Hereford, the Bishops of Rochester and Winchester. Indeed, I may say all the Bishops, without an exception, more or less, openly practise this holy duty of obedience to the Apostolic precept, in providing stalls for sons, or daughter's husbands, grandson's, nephews, and other *blood* relations, so that the clergy of the English Church are now in reality a consecrated race, a sacred *caste*, a spiritual Israel, a tribe of Levi, mutually related in *blood* by brotherhood, sisterhood, and good Samaritan neighbourhood. Nay, I may even go so far as to affirm that this consecration of the English priesthood extends itself far beyond the visible limits of the church. It has also sanctified the bar and the bench by the promotion of genuine Levites to the highest offices of State, and the most distinguished sinecures of Government. And as it was foretold of the ancient Israel that they should not labour nor toil, but that the Gentiles should labour and toil for them, so it has already happened with the spiritual Israel in part, and I hope will be still farther verified—that they have been blessed with ease and plenty, and Infidels and Dissenters have been obliged to pay tribute unto them.

These things are examples for your imitation, and encouragement in providing for yourselves and for your offspring. The blessing of the Lord is upon them that fear him, and do his commandments. Those commandments are not grievous; but to neglect your children's education or temporal prosperity is to neglect, to endanger their salvation. Who are the wicked? who are the reprobate? The unlearned, the uneducated, the destitute. These are they who curse and swear, and ramble on the Sabbath, and frequent gin-shops and public-houses, and coffee-shops, to read Whig and Radical newspapers, and other blasphemous productions, that openly avow their enmity to our sacred institutions, and attempt their overthrow. Of these, and such as these, the portion is fearful in the Day of Judgment. But who are the righteous? The meek and contented, who inherit the earth, who are too happy at home to seek entertainment in coffee-houses and gin-shops abroad, who are subject in all dutiful obedience to the powers that be, which are ordained of God, who fear God and honour the King, and meddle not with those who are given to change. (Some one here smiled). Ah! my friends, there are goats among you; but the day will

come when the goats and the sheep will be separated, when the wheat shall be threshed, and the chaff consumed, in that fire which shall never be quenched, and by that worm which shall never die. Oh! the judgment! the judgment! it is a fearful thing the final judgment! for if the righteous scarcely be saved, how shall the infidel and the sinner appear?

PHYSIOLOGICAL FRAGMENTS.

Felix, qui potuit rerum cognoscere causas!

ORGANIC MATTER.

THOUGH, at first sight, sensation, nutrition, and generation appear to be peculiar properties of organic matter, yet they have their apologon in all phenomena of nature. Attraction and repulsion correspond to sensation, chemical affinity to nutrition, and the formation of crystals and metals to generation. Moreover, if we examine the constituent parts of organic bodies, we find that they are made of the same elements which are found in that which is called inorganic nature. It is true, that no chemical process can give birth to any thing like fibrine, albumen, blood, &c.; yet, if we subject these organic produces to chemical analysis, we can decompose them into those elementary particles, which are the elements of universal nature. The constituent parts of the vegetable kingdom are carbon, hydrogen, oxygen, and also nitrogen. Moreover, we find, in different proportions, phosphorus and sulphur, kali, salt, lime, alumina, silicium, iron, manganese, chlorine, iodine, and bromium. In the animal kingdom all these elements are found, with the exception of alum—salt in greater and kali in less proportion, than in the vegetable kingdom—iodine and bromium are found in some shells. The elements of the higher orders of animals, as well as of the human body, are oxygen, hydrogen, carbon and nitrogen; sulphur, chiefly in the hair, in the albumen, and the brain; phosphorus in the bones, teeth, and brain; chlorine and fluorine in the teeth and bones; kali, salt, and lime, particularly in the bones and teeth; manganese and silicium in the hair, and iron chiefly in blood, in the black pigment, and in the lens crystallina.

The first difference between organic and inorganic bodies consists in the quantity, that is, the number of the elements. The organic bodies do not contain all elements, indeed some are injurious to organic life. The second difference consists in the mode of combination.

In the inorganic bodies there are but binary combinations. Monogamy is the primitive law of Nature. Two simple elements combine together to form one body; the body composed of the two elements combines again with a simple element, or another body composed of two elements.

Carbonic acid is the matrimonial union of carbo and oxygen. Ammonium is the matrimonial union of nitrogen and hydrogen. Carbonic acid ammonium is the matrimonial union of the two compounds.

Polygamy, or the combination of several elements in one body, occurs only in organic bodies. Sugar, starch, and fat, are threefold combinations of carbo, hydrogen, and oxygen; Albumen, fibrin, gelatine, &c., are quaternary combinations of the three first elements and nitrogen.

The organic bodies present also a more complicated numerical proportion of the constituent elements; moreover, the substances of which they are composed are all, for the most part, combustible. The organic matter preserves these peculiarities, only under the influence of an internal principle, called organic life.

As soon as the organic life is gone, the primitive combination of the elements take place, and we observe the phenomena of putrefaction. But all the changes, combinations, and developments, which occur in the organic as well as in the inorganic bodies, stand under the influence of the universal male and female agency of the imponderable fluid, magnetism, or electricity. Yet we have no reason to assume that even this fluid is the primitive cause both of inorganic and organic life.

We think that all matter is not living, but, under certain circumstances, capable of receiving life; that this capacity of life, this plasticity of matter, is not the cause, but the effect of

an internal and external intelligent principle. This principle is spiritual, because it cannot be touched by the senses; but it is evident, because it can be ascertained by its analogy in man, namely the spirit.

But the external world, or matter, being the evolution of the one internal principle, is equally eternal and co-existing with it. The creation is the eternal out-birth of the one. All Genesis is but an allegory of the phenomena of evolution, considered under the limited view of time and space.

PYTAGORIN.

THE PSYCHOMETER.

THERE is nothing which interests so much the philosopher than to find out the origin of the intellectual and moral faculties of man, of his instincts and disposition: hence we find the most eminent men of all ages and countries engaged in the solution of this problem. Hitherto, however, their attempts have been mere failures. Systems after systems have been built up with great labour, to give way to new speculations, which being founded more on suppositious than sober observations, were also doomed to pass away without leaving behind any satisfactory results. Aristotle and Plato, Democrites and Heraclitus, Epicurus and Zeno, Descartes, Spinoza, Leibnitz, Berkeley and Hobbes, Locke, Helvetius, Mirabeau and Kant, how much have they laboured to establish their theories, and how little have they advanced this science?

And yet it is not because these men were not possessed of love of truth, or of the most brilliant talents, that they have failed; nor have they failed because they have not chosen an opposite hypothesis. Read the writings of these eminent philosophers, and you will convince yourselves that they were actuated in their enquiries by the most ardent love of truth; and, desirous to avoid the errors of their antagonists, have placed themselves upon a side quite opposite to that of their adversaries. The one party maintains that all our moral and intellectual faculties are the consequences of our external senses. According to these philosophers, all our knowledge is acquired only through and by the senses; they are nothing but the necessary consequences of the influence which the external objects exercise upon our senses. This external world is the only thing that is real; the phenomena which it offers to our senses, the only object worthy of our knowledge. Facts, nothing but facts; matter, nothing but matter, ought to be the Alpha and Omega of our enquiries: what goes beyond or above these limits is nothing but error and falsehood.

The opposite party, on the contrary, rejects, with contempt, the testimony of the senses: the external world is to them nothing but a mere illusion; the senses are deceivers; the mind, the will, and the spirit are independent. Nature and matter are things either not existing, or of a kind totally different from the spirit.

Both parties have plausible arguments in support of their opinions, and are headed by men endowed with the brightest intellect.

Where lies the truth?

The philosophy of nature, by elevating our minds upon a higher point of view, finds that both parties are wrong, because they view but one side of the question; that both are right, because they acknowledge the existence of an external, material or that of an internal or spiritual principle. Both matter and spirit are existing, or co-existing; they stand to each other as cause and effect, as *nomen* and *phenomenon*. The spirit is, because there is a matter in which it incarnates itself; there is a matter, because without matter there could not be a possibility for a spirit to manifest itself. The eye is not the cause of the sight, but the instrument; but the mind would be *a non ens*, a mere nothingness, if not provided with the organ of sensation.

But the external organs and the internal faculties are generated in us, and born with us. If that is the case, the internal faculties are modified by the external organs, and the external organs are modified by the internal faculties.

This is the case in every organized being. In the seed, for instance, is both the germ of the structure and the spirit of life of the whole plant: but the seed remains for ever without de-

velopment, without the internal development of the living principle, the soul, or the spirit of the plant; yet this spirit or soul of the plant develops itself more or less the more or less its external organs are perfect. On the other hand, by giving a higher degree of energy to the living principle of the plant, by electrical or chemical or cosmic agencies, the external organs of the plant are rendered more perfect. Thus, the crab-apple is rendered a most delicious, beautiful, and fragrant fruit, by cultivation.

But where is the seat of the intellectual or moral faculties in man? Gall and his followers have found it in the brain. This system, which for many years has been the object of ridicule and contempt, both at home and abroad, seems now to be duly appreciated by the most eminent physiologists; yet it offers still many imperfections. It does not explain the unity of the self-consciousness of the individual; it neglects the due appreciation of the sympathetic or ganglionic nerves; it lacks of philosophical precision in the classification of the single faculties, and pays no attention to the influence which the vegetative and sensitive systems exercise upon the brain. It regards more the quantity or size than the quality of the organs, and being unhappily under the influence of materialism, leads people to believe that the external structure is the only cause of the internal dispositions.

In contraposition to this system, the German philosophers have invented another, of a more refined and spiritual nature, supported by Mesmer, Schelling, Treviranus, and other eminent philosophers. These men maintain that all phenomena of life, all intellectual and moral dispositions of man, are the effect of a subtle magnetic fluid, which is universally spread all over the universe. The discoveries of Orsted, in Copenhagen, and of Faraday and Ritchie, in this country, have proved beyond doubt, that light, electricity, magnetism, galvanism, are but the modifications of a bi-sexual fluid, male and female, positive and negative, existing every where either apparent or latent.

Berzelius, Rose, and other chemists, have discovered that even all chemical processes are nothing but different produces of electrical agencies; indeed, according to new experiments by a proper application of this fluid, we are not only able to decompose, but also to generate metals. Several physiologists now maintain that the act of generation is nothing but a magnetic process. Even the generation of diseases, as the cholera, for instance, and other epidemics, are ascribed to nothing else but electrical or magnetical phenomena.

It is therefore most likely that our own faculties, intellectual as well as moral, depend on modifications of this productive fluid, and that our thoughts, desires, propensities, are the effect or the consequence of electro-magnetic combinations; at least, it is evident that the whole process of life, the whole mechanism of thinking and feeling, our sympathies and antipathies, are connected with electro-magnetical phenomena. Whether these phenomena are under the control of a still higher faculty, whether this faculty has the power of modifying the electro-magnetical phenomena, in the same way as the gymnosis electricus can unload, according to pleasure, the electrical fluid or not, in the same way that some glow-worms can manifest or conceal their phosphorism, is a question which, according to the present state of the science, would be difficult to settle.

This we, however, think to be a fact beyond dispute, that the living human body is nothing but an organic electro-magnetic battery, and that every organic movement is accompanied by electro-magnetic phenomena.

These views have suggested to a natural philosopher in Leipzig the idea of constructing a machine by which, through the instrumentality of the electro-magnetic fluid, he might discover the dispositions of the human mind: he calls his machine Psychometer. This machine is a square box twelve inches long, eleven broad, and five high. A column, six inches high, and two diameter, is placed in the middle of the box, in the centre of which is suspended a magnetic needle, which points out the qualities of the approaching person. On one side of the box is a square tablet with one hundred holes, each of whom indicates the hundred faculties, intellectual, moral, and physical, into which the inventor has classified the human soul. On the other side there is a tube full of mercury.

In order to make the experiment, a glass tube 12 inches long is introduced in the machine, after having been electrified. A needle composed of glass and metal is placed at the same time on one of the 100 holes corresponding to the mental faculties. A loadstone is then placed near the little column, when the magnetic needle suspended in it moves, or remains motionless, according as the individual who holds the loadstone is possessed or not of the faculty indicated in the tablet.

For instance, if one wishes to know whether he is proud or not, he places the needle of glass and metal upon the No. 17, which corresponds to this faculty. He approaches the little column with the magnetic horseshoe, so that one of the poles comes in exact contact with its orifice. If the magnetic needle moves violently against the column, that marks that pride is predominant in him!!

In two hours one can easily repeat the same experiment with all the other numerals indicated in the tablet.

This is a fact which has been repeated successfully by many scientific men, and it is remarkable to observe, that when this machine was exhibited, several persons who had previously had the opportunity of having their heads examined in Dresden by the English Phrenologist, Mr. Noel, found that the results of the psychometer were generally in harmony with those of the Phrenologist!

We think that this machine might be improved by simplifying the classification, and by adding several (*plusieurs causes*) animal propensities, which the inventor has omitted, for instance, the instincts of propagation and of destruction.

It is not improbable, that by giving a more philosophical basis to phrenology, and by combining this science with psychometry, men will at length penetrate more deeply into the secrets of human nature.

We shall not lose sight of the progress of this new theory, in order to make our readers acquainted with all the inventions of our German brethren.

It is a singular occurrence, that Germany though sighing under the yoke of the most dastardly despotism, has since the religious reform of Luther, become, as it were, the focus from which all the ideas have sprung, which tend to give to the human mind that energy and development, which are the only safe basis for those social improvements which the world is every where striving to obtain.

When the mind is thus emancipated, there is no doubt that the gothic structure of despotism can be of no long duration.

The freeminded Germans will also obtain political freedom, and not only freedom, but the bliss of a social regeneration.

INTERESTING CONVERSATION BETWEEN A PARSON AND HIS PARISHIONER.

Parson.—Well, Jim, what is the reason you have left the church? I have missed you now these three or four weeks past.

Jim.—Why, Sir, I am tired on it; I see no good I derive from it. The ministers of the altar are more fond of the offerings than the service.

Parson.—Now, Jim, I see how it is; you have been listening to some of those ungodly doctrines, which are now corrupting the public mind, and destroying the piety and morality which have so long distinguished this highly-favoured country.

Jim.—Why, yes, I do read some on 'em; and they've opened my eyes, and put a stop to my slumbers. If you see how it is with me, I see as well how it is with you, Sir. Ha! ha!

Parson.—Well, what new light have you got? Let's see.

Jim.—See! how can I make you see? I see for myself only; I see nought for nobody else, and can't make eyes nor spectacles for parsons. But I'll tell you what I see—I see that this 'ere Protestant reformation was a regular humbug, after all; and we are as far from God's truth now as ever.

Parson.—What! then you have turned Papist, Jim?

Jim.—Papist! no; not a hair of me; I'm too sick o' the craft.

Parson.—I hope you have not become infidel, Jim, though that is not a whit better than Papist, in my eyes.

Jim.—No! nor infidel. I was an infidel when you were my teacher. The greatest infidelity of all is to profess to follow a master, and in secret to deny him. Your Christianity is religious treason; you have betrayed your master, and persuaded others to back you in your infidelity. You have perverted the morality of Christ, and made religion a reproach by its infidelity. What you call an infidel is merely a deserter; but you are a mutineer in uniform.

Parson.—What's all this about, Jim?

Jim.—About! it's about your infidelity to your master—about your murders, your plunderings, your sheep-shearings, your professions! I'm sick on 'em all. I'll none on 'em no more. I've done with your hypocritical forms of godliness.

Parson.—Jim, Jim! your good sense and clearness of apprehension seem to have totally deserted you. These murders, plunderings, and vexatious proceedings to which you allude, have nothing to do with religion; they are merely the consequences of rebellion against the rights of property. Surely the clergy have as good a right to possess property as laymen have.

Jim.—I wish they would content themselves with laymen's rights. Laymen do not lay claim to a tithe of land and labour. Laymen collect their own property, but they never interfere with other people's. Landlords claim their rents, but they never come and count our ricks, and *sneak* about our poultry-yards and pig-styes. There is no gospel in this, I say. The religion of Christ was intended for the poor man's comfort. You have made a yoke of it. I've tell ye, Parson, were your religion what ye call it, or what it should be, the poor would flock to it.

Parson.—Ah! Jim, the fault is more in the depravity and sinfulness of the human heart than in the church, on which you lay the blame. These obstacles of which you complain are merely the outward annoyances of the flesh, and it grieves me to think that you should ever weigh them in the same balance with the spiritual comforts of religion, the pure waters of the sanctuary.

Jim.—It grieves me that you should do it. You make religion dependent upon property. You tell the people the church is in danger, that is, its property; and rather than lose this property, you'll see the people drop off one by one amongst Infidels and Dissenters. This shows me that you prefer the property to your flock. Now, were you what you pretend to be, you would prefer the flock to the property. Why, I'd rather spurn tithes and offerings for ever, than take them without the accompaniment of the heart of the giver. Oh! Sir, I've seen a great light now, which you never showed me, it is this, "religion must all lie *here*" (pointing to his heart).

Parson.—Why, Jim, I always taught so. This is no new light, sure.

Jim.—Oh! your showing's nought—nought at all: 'tis all outward, all property, forms, ceremonies, Bible societies, prayer-books, and evil disposition against all other sects but your own, and especially against those as wants to remove abuses in Church and State. I see through it.

Parson.—But don't you know, Jim, that there can be but one true faith, and that it is a dangerous thing to belie the spirit of God, by rejecting the evidence he has given of the mission of his Son, whom a voice from the excellent glory declared in the hearing of men to be the beloved of the Father, whilst his own marvellous works confirmed the extraordinary communication.

Jim.—I neither heard the voice, nor saw the works. However, I do not discredit either. But God speaks to the wise and the good continually; he speaks through the grass, and from the trees, in the wind, and from the stars. This speech is quite as intelligible to me as the speech of dreams and prophecies, although I don't deny these same. It pleased God in former times to make things mysterious and contradictory, merely to put us on our mettle. I do the same to my children, and it does 'em a world of good!

Parson.—What's that, Jim; surely you do not mean to assert that God would deceive his creatures?

Jim.—To be sure I do! What harm is there in deceiving them in time, if He undecieves them in eternity? If He were to send them to hell for being deceived, I should think it wrong in Him to deceive them; but I have got over that. I don't

see the use of giving them religious truth, *until they got general knowledge and good practical experience on other things. I do really think it has been an advantage to men to be deceived on religious subjects.* It has sharpened their wits, and made them more intelligent than they could have otherwise been. The most ingenious and intelligent nations, I am told, have been the greatest disputers, and savages and barbarians cannot argue at all.

Parson.—Why, Jim, that's true enough; but surely you would not deceive men merely to sharpen them?

Jim.—Assuredly I would.

Parson.—Then why try to undeceive them? Why not let them remain as they are?

Jim.—I am not God. Man has no right to deceive man. As long as it is good for men to be deceived, they are deceived; but there are times of refreshing from the presence of the Lord, as the Scriptures say; times of regeneration and reformation, and in such times the veil is partly withdrawn, and new light is shed abroad. I think we are in such times at present; but far be it from me to think myself infallible; I merely see some of my former errors, and cast off some of my old skin, which is now too thin to cover me.

Parson.—But, Jim, remember that the true light cometh from God, and we know of no revelation at present which can supersede the revelation of the Son of God.

Jim.—The revelation you stick by is a revelation of the flesh of the Son of God. I don't think it equal to the spirit which he promised (its effects have been very mournful); and as that spirit is an inward teacher, I look for it in myself and others, in the simple operations of the mind. The only true light a man can have is within: the outward light is a dead light; the inward light is a living light.

Parson.—True; but has not Christ promised his spirit to them that follow him?

Jim.—Yes, but the way to follow him is not to stand still, as you do. Education is a moving thing. We do not read the horn-book all the time of schooling.

Parson.—But the horn-book is always true, Jim.

Jim.—Yes, it is always true; but it is very *darkly* true to one who never goes beyond it; and he who goes beyond it, throws it aside as useless. The spirit is always moving society forward. It is the conservatives that won't follow him. The alphabet of religious truth might be taught by Christ, and the syllables by his apostles, but the spirit of God, which is always in man, is now casting off the mystery with which he clothed the former ages of infantine society, and making truth more evident. He said he would gather the grain together, and throw away the chaff.

Parson.—Yes; but the chaff is in man, Jim, not in the word of God.

Jim.—When God makes wheat, He always makes chaff; and as he compares revelation to wheat, I consider that there is a part of it grain and another part chaff and straw. I see nothing wrong in this; we know He threw away the law and the prophets in part; and I do not see why the chief portion of the present Christianity may not be treated in like manner. The grain is but a very small thing; that I would preserve, and I have no doubt it will be preserved; but the clergy seem to be more anxious about the chaff and the straw, which I would destroy.

Parson.—What do you call the grain, Jim?

Jim.—The grain! why, the grain is this, "that in every nation, he that reverenceth God, and worketh righteousness, is accepted of Him," and that English parsons are no better than Heathen ones. There is only one good priest—the spirit that is in a man; he is the priest for ever, after the order of Melchizedec.

Parson.—Then you would have no such thing as a church and a priesthood.

Jim.—Not a stationary priesthood. I certainly would have a system of instruction, and congregational meetings on Sundays, for the cultivation of the moral and religious character; but I cannot approve of binding down people to old forms or doctrines of any sort. Let man be free to work out his own spiritual as well as his temporal prosperity. It is a killing

thing to stick a man on a creed, like a fly in a honey-pot, and then preach to him piously and pathetically of the loving kindness of God. Experience has taught us the folly of it. If we cannot get parsons to our mind, we must become our own parsons; but, it is my opinion, we would get parsons to our mind if it were not for the creeds.

Parson.—Then, why don't the Voluntaries preach palatable doctrine?

Jim.—The Voluntaries all have creeds; they are all corporations; and free thought has been stifled among them. Their clergy and preachers dare not think beyond the limits of the creed: the consequence is, there is no middle church between corrupt and absurd Christianity, and downright infidelity; and the people, knowing no better, turn Infidels, merely to get rid of disgusting nonsense.

Parson.—Do not ye call the Unitarian a half-way house between faith and infidelity, Jim?

Jim.—I don't want a half-way-house between faith and infidelity; I want a half-way-house of universal and pure faith between the infidelity of the church and the infidelity of the professed infidel. The Unitarians make an old shoe of religion—their paltry contentions about some parts of Scripture being inspired, and some not, show the narrowness of their minds. What does it matter? will the inspiration alter the authority? when a prophecy is given, and fulfilled, when a miracle is performed, they show a superhuman knowledge and power, but they cannot stand as evidence for any other truth but themselves; for God may deceive, and work a miracle or inspire a prophet, to clench the deception; and the Providence, or the spirit of God, may put in a passage by interpolation or fraud, which may be more important, true, and beautiful, than those which got in by fair means. A passage which has been acknowledged for ages by the church is as good as inspiration: it shows that Providence meant it to be there. I despise the Unitarian cavilling; he is as great an infidel as the rest of you.

Parson.—You are a strange fellow, Jim; you seem to me to be a Pantheist; you believe that God does every thing, but, if so, how can we make a distinction between right and wrong?

Jim.—By feeling it.

[We must reserve the remainder for a future Number.]

THE PHILOSOPHY AND THEOLOGY OF TURBANS, BONNETS, AND HATS.

A GOOD-HUMoured ARTICLE.

THERE must be inspiration of some kind or other in hats. They have produced wonderful revolutions in society, i. e., they have been used as signs and symbols to inflame the minds of men, or keep them hot when they were influenced. Fifty years ago, the *Bonnet Rouge*, or Red Bonnet of Liberty, in France, was an infernal machine for the whole antiquated system of Royalty and Hereditary Legislation. The inspiration was universal; even the nobility and clergy were obliged to use it *bongré malgré* (willing or not willing), to save their lives; and men of wealth and equipage had it painted on their carriages, and incorporated with their arms, to pacify the minds of the jealous populace. The use of it began with the working classes, and the leaders of the democratical party, and as the confusion increased, the bonnet increased its circulation and respectability, till at last, from being the emblem of a party, it became the badge of Liberty and Republicanism to a whole nation. We now see it introduced into our Radical hieroglyphics, like an old night-cap stuck upon a pole, with multitudes of shouting and gaping votaries dancing around it, not bending in solemn reverence, as the Swiss did to the hat of Gesler, but raising the head erect, and shouting, "This is thy God, O Israel, &c."

There are many different kinds of hats and bonnets, and each has a peculiar character of its own, like the different sects and parties of religion; but the two great divisions are the covering without a rim and covering with a rim. The first is the Catholic, the second is the Protestant cap of liberty: the former has been adopted by Southern nations, the latter by the Northern. There is, therefore, a sort of religious difference. The Dutch adopted the *hat* during the long war against Philip the Second, for the principles of the Reformation. It is seen upon their medals to this day, and medals struck at the same time in England,

during the reign of Cromwell, have the same emblem of liberty. This probably may account for the enormous broad rims of those times, which still adorn the pictures of our puritanic ancestors. A gold medallion of Sweden, of the same period, contains an image of liberty, with a rod in her hand, and a large broad-rimmed hat stuck upon the top of it, with the motto, "*Proscripta licentia*," that is to say, liberty is not to go to the excess of licentiousness—"Licentiousness is proscribed."

But there is no such emblem of liberty as the hat in the Southern or Catholic climes. Not that the bonnet is original to Catholicism, for it can be traced far beyond it; but so can the rites, ceremonies, and superstitions of the Catholic church; but it seems to go hand-in-hand with other lines of demarcation, in drawing a distinction between the South and the North—the people of imagination and irritability, and the people of coldness, prudence, and industry.

The old cap of liberty, like almost every other universal sign or symbol, loses its origin in the mists of antiquity and fable. Some say it came originally from Lybia, and was derived from the shell of the ostrich egg, which used to be employed as a covering by some unknown or long forgotten nation of Northern Africa. Some say it had its origin among the gods. Castor and Pollux are always painted with it. Ulysses, also, is represented with this skull-cap, which stands stiff upon the head, only a little higher and more pointed than a monk's cowl. The Greeks were peculiarly scientific in the use of it, being an emblem of freedom, in opposition to slavery.

The Lacedemonians wore it when they went to war, and the modern Greeks, when expelled by the Turks, adopted it with enthusiasm, and carried it amongst the Western nations.

But it was not unknown to the Western nations themselves. Liberty is represented on the Roman coins *Capite Pileato*, that is, with her head covered with the *pileus*, or bonnet. Numerous medallions, still preserved in cabinets, represent her so attired. For instance, a large gold medal of the Emperor Decentius has liberty bonnetted on the reverse; and a silver one of Vitellius represents Liberty standing half naked, her head covered with a bonnet, with a vessel in one hand and a spear in the other. The Romans, when they manumitted a slave, put a bonnet on his head, and on this bonnet a rod, both being the sign of deliverance, and so used to this day, for the rod upon which the bonnet of liberty is raised is only the Roman *vindicta*, or instrument of punishment, taken from the master and given to the freedman. It was in strict conformity with this universal and antique inspiration, that Moses had a rod put into his hand, when he redeemed the Israelites; whilst the bonnet of Aaron, made of fine linen, is only the bonnet of liberty, sanctioned by Revelation itself, for the same God that speaks in dreams and visions, speaks also in habits and customs. Aaron's mitre had no rim, but it was rather pointed at the top, like the Bishop's mitre, which would be an emblem of folly or ignorance, were it not divided. The Jewish system has perished, like the holy garments, and the rod that budded is lost like the spirit of the whole institution. The rod of Judaism, however, has brought forth fruit which fills all Europe, and many other portions of the habitable world. And why, because the mitre was cloven, as was the church, and always has been, and must be for ever; for God and Nature, though one, have a distinctive character, and this cleft is the personification or emblem of the Bipolar or Bi-sexual character of universal being. Though, therefore, the Jewish church died in one sense, it was preserved in the Christian church in another. The Roman mitre, which has three points, is, as the emblem of the whole Catholic or Universal church, representative of Jewism, Christianity, and Mahometanism, the three brother churches, which spring from Abraham. The Jewish mitre was also triple in another sense; first it had a cap, then the cloven mitre above the cap, then a crown round the mitre—Liberty, Ecclesiastics, Politics—showing that church and state should be based upon liberal principles—a beautiful emblem! The Roman mitre has a cap of liberty under its three peaks.

Turbans are mysterious caps; they belong to the marvellous, and are peculiar to Oriental nations, to the Indians, Persians, Turks, and ancient Jews. The common cap of the Jewish priest was a turban made of a long piece of cloth,

wound round the head. This is an ancient emblem of mystery, an *ophite* symbol of the serpent, which is a capital emblem of reasoning in a circle. No wonder, therefore, we find this article of dress predominant in the regions of Mythos, and unfathomable depth of theological skill, and rejected by the Western and Northern nations, who are destined by Providence to cast off the veil that has hitherto darkened the sun of knowledge.

The whole catalogue of masculine head-dresses, may be divided into three—the *TURBAN* first and greatest, which arose in the regions of the sun and the cradle of political and religious institutions—the *BONNET*, which belongs to the earliest civilized inhabitants of Europe, the East and South of Europe, the Greeks and Romans—the *HAT*, which is the peculiar distinction of the occidental world, or Protestantism.

These are the triple crown of man, and each has a distinct character. The turban is deeply mystical and Pantheistical, but incapable of unwinding itself, and exploring its own labyrinths. The bonnet is warm, generous, brave, and enthusiastic, but imprudent, and deficient in foresight; the hat is cold, phlegmatic, deliberate, and determined; it is the only one of the three capable of completing an incipient measure with success; but its measures are very mechanical.

It is curious how this nice little theological doctrine applies to women's caps. Married women wear caps with rims, or borders, to denote their prudence and discretion; but whenever a woman loses her husband, she abandons the border, and wears a widow's cap, to denote that she is now free from the law of man. A widow's cap is a bonnet of liberty, the genuine bonnet of liberty; and all the world knows that widows are very romping, at least all the world says so.

But what shall we say of night-caps—those nondescript caps, with a tassel on the top, that will hold a bushel of malt, or an ordinary sized sugar-loaf. You need only go to a Christmas pantomime to see and know all about it. It is a fool's cap, an emblem of sleepiness or dullness, and every man is a fool, and looks like a fool too, who wears it. It is the cap of Ganymede, of Paris—two personifications of licentiousness, weakness, and folly, who are represented with it, the Trojan cap. This cap has always the top hanging over in a fold; it is more picturesque, and for this reason painters have often substituted it for the cap of liberty, and our hieroglyphic gentlemen of the almanack press do so still, from ignorance. But it is all right. The inspiration of Nature is upon them to show to the wise that the vulgar notions of liberty are, as yet, too incoherent for good practical purposes. However, it is really too bad, after all, to raise a fool's cap on a rod, and call it "The Cap of Liberty!"

Having given this long dissertation upon scull-caps, we must give a little advice to our friends before we conclude. If you want to appear stern, precipitate, sword and gun, thunder and lightning revolutionists, wear hats without rims. There is a revolutionary inspiration attending them—"How it comes let doctor's tell"—but we have no doubt you will feel the effects of it, after a little habitation. But, on the contrary, if you want to appear cool, deliberate, and "summat" conservative, wear a good large rim, three or four inches at least. Look at the cool, placid inspiration, that has attended the Quakers in all generations, countries, and climes; and look at the well known fact, that whenever a Quaker, young or old, begins to narrow the rim of his hat, it is a sure sign that his zeal will speedily give way. We are informed by a celebrated hat manufacturer that the Tories are beginning to wear broad rims. The Earl of Chesterfield has just got a hat with a rim 3 or 4 inches broad, and low crowned; and he is the leader of the hat fashion. If it become universal, it will cause a favourable change in the public mind, and perhaps bring the House of Lords to their senses. The reason why the broad rims of the puritans did not produce the prudent and liberal results, which they have a tendency to produce, was that the crowns were high and sugar-loafed, partaking profusely of the character of fool's caps. We are happy to hear that the Earl of Chesterfield's new hat is *not* a fool's cap.

For some time past the hats have tapered a little at the top, and been higher than prudence required; they are now bell-shaped, and broader at the crown. What effect the bells may have, we know not, but we are glad of a change at all

events. Our own hat is quite straight-sided, made so by mistake.

All wise men wear broad rims. Look at Mr. O'Connell how well his brows are shaded; look at Mr. Owen—there's a brim! look at Spring Rice and Joseph Hume. O'Connell's hat was rather peaked and high the last time we saw him, and really we did not regret it, for he requires a bit of the puritan to keep up the excitement of his unbreeched and unbunnetted bog-trotters. Were the Bishops to wear their mitres daily, they would be greater fools than they are. The mitre was always worn by old women in ancient times. "Pilea virorum sunt, mitræ feminarum," says Servius, i. e., bonnets are men's caps, mitres are women's. The cleft on the top is a good idea, and somewhat neutralises the influence of the peak. Josephus expressly states, as if it were of great importance, Ant. 3. 8., that the high priests' ordinary cap was *not* high crowned. The reformers, Luther and Calvin, as an emblem of bigotry or narrowness of mind, wore bonnets, but very low crowned. Now a bonnet with a low crown has almost the same effect as a broad rim with a high crown—a puritanic hat. It is a monk's cowl; it is a fanatical cap of liberty (monks never married). Don't wear it. The poet Cowper, always wore a night cap, his portraits are all so drawn. Now that poor fellow went all wrong, some how. With a fine, a noble genius, he was a simple, melancholy fool. The cap accounts for it.

The best of all wears is a good broad-rimmed beaver, crown of moderate size, not peaked, nor broad at the top, by day, and a cap of liberty, neither very long nor very short, by night. Let your wife wear a turban, and then you will have all the three caps in your own double person. If you do not find wisdom by this process, we can do nothing for you; your case is a hopeless one.

We had almost forgot the old Scotch bonnet—the Bonnet of Blue. The crown is so low as to rest upon the head when worn. It has no rim; it is barrel-shaped; being very capacious and unable to stand erect, it falls down, spreads out at the sides, and forms a shade as broad as a Quaker's hat. It is a curious problem to solve the effect produced by this process; but there can be no doubt of this, that it is too roomy within, and is not a cap of liberty. The broad rim implies prudence and caution, but the large roomy space within implies servility, or want of spirit. (The captive kings on Constantine's triumphal arch are represented with large roomy caps). There is a smaller bonnet worn by the young, which does not spread out as the large one, but it is very broad at top, and looks like water in the head (Hydrocephali). The bump of cautiousness is very well developed in this latter, and thus amply compensates for the want of a rim. Both bonnets have thus the same tendency, and correspond most exactly with the national character.

In fine, we lay it down as a rule, that these recondite and apparently trifling correspondences are as carefully preserved by God and Nature as the laws which regulate the revolutions of planets. Little things to the supreme mind are as easy as great, and great as easy as little, and both equally important in the management of the Infinite and Eternal Harmonicon.

Query.—Why do the Commons uncover before the Lords? To show their servility. Slaves went bare-headed of old, and whenever a master, in disposing of a slave, could not guarantee his servility, or good behaviour, he put a bonnet on his head when he took him to market, as much as to say, this fellow is fond of liberty.

VALUE OF EDUCATION.—In September, 1831, out of fifty prisoners put on trial at Bedford, only four could read. In the month of January, 1833, there were in the same prison between fifty and sixty awaiting their trials, of whom not more than ten could read, and even some of these could not make out the sense of a sentence, though they knew their letters. At Wisbeach, in the Isle of Ely, it appears, from a memorandum on the Calendar, of a kind which ought to be affixed to every similar document, that out of nineteen prisoners put on their trial, only six were able to read and write: and it is added, the capital offences were committed entirely by persons in a state of the most debasing ignorance.

[Price 3d.]

FOLLY OF THE CONTROVERSY BETWEEN BELIEVERS AND INFIDELS.

If this controversy be carried on hereafter upon the same principles as heretofore, it will be everlasting. It is impossible for a liberal, a generous, or a candid mind, to take either side of the question, and consequently it will be conducted by partizans and zealots, who fight for victory, under the influence of strong prejudices and irrational excitement.

The grand question hitherto discussed is the meaning of a book.

The one party thinks it sufficient to allege the evidence of prophecy and miracles in support of this meaning.

The other seems to grant the premises by employing all its energies, skill, and learning to baffle those miracles and prophecies! Now suppose every miracle in the Bible to be literally and historically true, which we do not deny, and the man is a fool who does deny it, for he knows nothing at all about it, what have we gained? Only a historical fact, a material of thought; but no evidence for the truth of any other doctrine but this, that the power which wrought those miracles, wrought them to support the doctrines they were employed to establish, for the time being. But the question of the final truth of those doctrines is a question which has nothing at all to do with the subject. For if it be an established custom with God and Nature to present fallacies to the senses, to exercise our reasoning faculties, as we find to be the case in the infancy of every science, why should not the same law be observed in Revelation, which like the rising and setting of the Sun, is first presented as a delusion and left to human ingenuity to unveil. We have no reason to doubt the truth, with perhaps some slight inaccuracies and amplifications of all the historical records of the Bible. They have very powerful evidence in their support, too powerful indeed to admit of a direct negative, or to afford a resting place for positive infidelity; but we most decidedly reject the authority of miracles or any other such works, however wonderful, as evidence in behalf of abstract religious opinions. Nay, we go even farther than this, and we unhesitatingly declare, that whenever a miracle of any kind is wrought there is an intention to deceive. It is an outward sign, and is inferior in authority to a mental impression. It affords no doubt, an evidence of an overruling Providence, but who with any appearance of reason on his side can doubt this?

Deception is the first law of nature in the sciences, and for conscience's sake we are bound to believe that it is the same in religion.

We are none of those prudish philosophers who do not see any use for miracles, visions, and Revelations. They are useful for the establishment of *false* religions, for clenching deception, implanting prejudices, kindling religious zeal and fanaticism and stirring up the flame of metaphysical controversy. The Infidels will no doubt frown at this idea, but still it is a fact, that the most enlightened and ingenious nations have had most to do with these evils. The Grecian Philosophers contended for hundreds of years respecting the oracles, whether they were real inspirations of deity or mere priestcraft; and the most eminent and learned were ranged on each side. But they reasoned like the believers and Infidels of the present day, upon false premises; the infidel party maintained that as the oracle sometimes lied, it could not be inspired, and therefore concluded that when it was

right, it was right by accident. The other party had not the sense to perceive that the falsehood was in perfect consistency with its divine inspiration, as the whole phenomenon was manifested *merely to create a controversy to cultivate the reflective powers of man*. Had the oracle been a plain speaking honest oracle, there would have been no use for it at all. It was just as it ought to be, an equivocal thing, which left the mind in doubt whether it was revelation or not. Were we a disembodied spirit, and had the power to train a savage tribe to the arts of civilized life, we would follow the same system which Nature has adopted with the Greeks and Christians—set up an oracle in the midst of them, half true, half false, and set the fellows a wrangling and disputing upon metaphysical questions. This would compel them to create a language for the expression of abstract ideas which they could not have otherwise obtained, and as soon as they had got a tolerably copious and expressive language, we should let the oracle drop off and leave them with their increased stock of imaginative ideas and correct diction, to devote their acquired energies to the development of experimental science and art; when this experimentalism had run its course we should most probably revive the oracle, and tease them until they found out the secret that we were teasing them. Having discovered this, we and they would be good friends ever after, and they a well tutored intelligent people. There is no mystery in this idea, and it is too simple, consistent, and intelligible to be false. In fact no other intelligible view of the subject can be taken. But our prudish philosophers of the Sectarian or Infidel school, however placidly they may listen to what you say of the wisdom of Nature, will never allow that she can articulate oracles or foresee futurities! How very wise she must be! The God and the Nature of such philosophers are a pair of “*dummies and deafies*.” How very interesting! We think the committee of the Deaf and Dumb Asylum ought to adopt them both for their patrons; and as neither of them can see, the Blind Asylum ought to join the party. As to the wiseacres, who have the use of those three faculties, they are superior to the power that formed them! And this is the wisdom of the 19th century! If the 20th. century do not unanimously call their ancestors of the present day *fools*, there will be two pretty large parties of *infidel* and *infidel* non-descripts in the next centennium.

We have read quite enough of the controversy between the advocates and opponents of revealed religion to convince us that neither party knows any thing at all about the subject, that they are mere theorists, that they are not students of Nature, not acquainted with the facts necessary for reasoning upon the subject, and both unwilling to adduce facts which are likely to prove conclusive. There is one half sentence in Brougham's Theology which shows that glimmerings of truth have strayed into the faculties of that learned civilian. “Therefore it is evident,” he says, “that no sufficient evidence can be given by Revelation alone in favour of the great truths of religion.” Because he said it was possible that the being who revealed might be intentionally deceiving his creatures; but the way in which the crafty old gentleman turns round to humour the clergy, by saying that natural religion teaches us that God could not be a deceiver, is so absurd and so false, that it leaves the subject in greater mystery than he found it. God never yet gave a revelation but Nature rose in opposition to it; and, *vice versa*, Nature never yet gave a revelation without meeting a

similar opposition from God. If God reveals by voice and vision, Nature opposes by reason and reflection: on the other hand, if Nature reveals by oracles and science, God opposes by prophecies, hallucinations, fanaticism, and unknown tongues. The balance is adjusted by meeting extremes with their corresponding opposites, and rest is finally obtained *only* by an equilibrium; for deception is produced by both, and continues until the marriage union takes place in the mind, which reconciles God and Nature in all their works. But where is the sect, where is the party, the individual in whom this union of conflicting extremes has taken place? Echo answers "*Where?*" and the empty vault reverberates the sound.

The idea of subduing and extirpating Christianity, by opposing its historical truth, is so extravagant that we have never read any attempt to do so without astonishment. Voltaire was, in our opinion, a much greater fanatic than St. Paul. Voltaire attempted what was beyond his power to perform, but not so the other. Voltaire and his school made more false predictions respecting their success than did the twelve fishermen of Galilee. Yet Voltaire and his school have been very successful. It is partly to this school that we owe the present revolution in the political and ecclesiastical condition of Europe. And we do not wonder at it; it is merely the one extreme of folly rising up to correct the other. Victory is out of the question, a wound is all that the enemy can accomplish. Having no stability, or positive principle itself, how can it ever supplant its opponent, more especially when that opponent has at least one half of history and philosophy on its side?

A new school must be formed.

Some years ago we read *Paine's Age of Reason*, and we read it with a friend; he sat on one side of the ingle and we on the other. We read alternately, and talked over every paragraph. It is the only controversial work we ever read in this manner. The common-place blunders which Bishop Watson and others have alluded to we entirely overlooked as unworthy of our notice; but the greatest of all blunders (and one which the Bishop has not mentioned, because he has fallen into the same blunder—being, in reality, of the same school as Paine, only in a different class), namely, that if the Bible be a revelation from Heaven, it must be literally, geographically, and historically correct, did not escape us.

We are most decidedly convinced that neither Paine nor his respondent understood the very primitive elements of natural religion, upon which all parties agree the authority of Revelation rests. Before Revelation can be believed, natural religion must demonstrate that Revelation cannot be deceptive. Now, if natural religion demonstrate that Revelation must, according to the universal analogy of Nature, be deceptive until it is satisfactorily explained, in the course of ages, like any other science, not all the miracles in the world can prove it to be non-deceptive. On the contrary, the greater the miracle the greater the deception lurking behind it. For of what use can an outward miracle, addressed to the senses and the faith, and *not to the understanding*, be, but to impose upon the mind an illegitimate conviction? When God does not take captive the will and the understanding in favour of a doctrine, He does not desire to have them devoted to that doctrine; he secretly employs them in some other way, whilst the miracles performed to establish *partially* the doctrine in question are materials for thought, and calculated to introduce useful suggestions, and afford important lessons to the active and contemplative mind. The miracle is not wrought to prove the truth of any doctrine, but merely to set it up as a sectarian principle, upon which to employ the energies of the human mind.

Whilst, therefore, we admit the truth of ecclesiastical history, in respect to the superhuman interference of Providence to set up the church, we at the same time assert, that the very thing thus set up by miracles is an evil, and that every good man is entitled to oppose it, and look for a divine blessing upon himself for so doing; that blessing he will feel in his own conscience.

The greatest work of God that we are acquainted with is the human mind; and surely every Christian will acknowledge that the finest field of operation for the Divine Spirit is His own spiritual and conscious offspring. Miracles are all outward operations; they are performances upon dead matter, or merely

organic matter. We readily grant that this is the best and the only method of addressing a rational being, for it is through the medium of the senses that rationality is informed. But the very circumstance of addressing a rational being from without, in this manner, implies that the rational soul itself, which is addressed, is expected to pass its own judgment on the works performed. The great work, therefore, of God is not in the miracle, but in the judges of the miracle. The miracle is a mere trifle; it is a means to attain an end. The end to be obtained is an impression upon the human mind.

So far, we believe, the whole religious world concurs with us.

But what is the end to be obtained?—is it an end which works with the miracle or against it?

Remember, although God is in the miracle, he is also in the mind, that is looking at the miracle. Now, which is the *greatest*? God in the mind or God out of it? Every man in his senses will say, "God in the mind." Then God works in some minds with the miracle, in other minds against the miracle. The mind being the field of contest, how is the point to be determined? The two advocates, or barristers, may be supposed to argue the case thus:—

Counsel for the Miracle.

My Lord—Here is a miracle performed—granted. Here is a doctrine taught—granted. The miracle being true, the doctrine must be true. None but God could perform the miracle. God is allowed to be the performer of the miracle; *ergo*, the doctrine supported by the miracle, and for which *solely* the miracle was performed, must be a true and a divine doctrine. My Lord, the thing appears to me to be self evident. I cannot understand upon what principles of reasoning my opponent will refute my syllogism. If he be so bold as to deny the fact of the miracle, I shall batter him with artillery so strong and loud and luminous and voluminous, that no fortress, however strong, no rock, however massive, no labyrinth, or cave, however intricate or sheltered, will afford him protection. Now the doctrine taught is this, that if he does not believe what the miracle supports, he will be damned everlastingly. Pitying his forlorn case, and praying God to open his eyes to see the truth, I wait for his reply.

Counsel for the Defendant.

My Lord—I can scarcely refrain from smiling at the logic of my learned friend, and more especially at the concluding declaration, that I *must* be damned, because my logic is not the same as his. If damned I must be, I cannot help it; for my conclusions are quite decisive, and my convictions not to be intimidated. I must be created anew to reason like him. This, no doubt, he also maintains, and he calls this new creation *regeneration*. Now, my lord, I maintain that as the Almighty has set all Nature in contrast or opposition, atom against atom, pole against pole, acid against alkali, and negative against positive, and manifested His power in each and all, so, also, upon the same principle, has he set up faith against faith, and doctrine against doctrine. He has set up a faith by miracles, and another faith without them, and he has set them together by the ears, like two great thunder-clouds riding on tornadoes. In the one he is working positively, in the other negatively. Which of the two, my Lord, is the true mode of working? Your Lordship smiles, and in that smile I recognise the reply—"They are both true modes of working." Now, my Lord, so far from disputing the truth of the miracles on which he rests, I positively admit them to be true. But although they are true as miracles, they are not, therefore, to be set up as metaphysicians. A witness brought to the bar of this court may be a true man, but it does not therefore follow that his testimony is true. The miracle is one thing, and the testimony is another thing. My own firm conviction is, that the miracle was wrought to set up an imperfect faith upon which to exercise the reason of man, to point out his weakness, in so far as he is disposed to rely upon outward testimony, in opposition to the more authentic evidence of his own understanding. When this *true* lesson has been thoroughly impressed upon man by a *false* faith, man will no longer seek God in the experience of individuals, and in the histories of little sects, and the manifestations of particular times and places; but he will enlarge his mind by looking at universal Nature and Providence, and making his own free, unbiassed

unintimidated reflections thereon. Were this freedom from the bondage of miracles once obtained, men would soon be at one upon religious subjects; their common nature would lead them to a common centre.

Thus God actually makes use of a false medium to communicate truth. Truth never does come directly into the human mind; it always comes indirectly. We misconceive many times before we conceive aright. The Revelation itself is not entirely false; but the obvious meaning of it is false and contradictory, and this falsehood and contradiction will keep the church in hot water until it be acknowledged that Revelation is merely raw material for reason to weave into a system of consistency and truth, in accordance with natural science. No man can destroy the material; and here appears to me the beauty and use of miracles. The existence of this raw material of Revelation depends upon them. Without miracles and prophecy it would have been cast aside long ago. But to secure its continuance in society, to make it an everlasting element of thought, it was necessary to fix it by some extraordinary interference of Divine power. This has been done; and now nothing remains for man to do but to find out the meaning of it, to study it as a science. *not to establish some particular view of it as an infallible standard.* I put Revelation in the list of the sciences. Suppose, therefore, the science of astronomy had been established in this country at the same time as the thirty-nine articles; we should now have been learning in our schools and colleges the antiquated and obsolete system of the sun revolving round the earth, with all its consequent absurdities. Were a medical system enforced by Act of Parliament, the same absurdities would follow. Jesus Christ wisely said, "My kingdom is not of this world:" that is, it has nothing to do with the fixation of politics, for the path of the just is like the shining light which shineth more and more unto the perfect day. The disregarding of this advice, which was distinctly foretold, has caused the corruption of the church by making religion stationary, whilst every other science is progressive. This has caused an opposition between religion and science; and if religion do not assume a progressive character, it must be destroyed, and ought to be destroyed. We may just as well follow the astronomy as the theology of our ancestors.

Counsel for Miracles.

My Lord—I confess this is a very ingenious invention of my learned opponent, by which he converts Revelation into a raw material, to be manufactured into any fabric, coarse or fine, vulgar or polished, as the manufacturer himself thinks proper. But is it not taking too much liberty with a direct communication from heaven to treat it with such discourtesy? Revelation was intended to be obeyed; it gives commands, it gives exhortations. You may just as properly make an Act of Parliament a material for thought, as a decree of Heaven which is put forth under a penal injunction. Surely God has a right to command, and, in commanding to punish disobedience. My learned friend gets over this difficulty, no doubt, by maintaining that God acts *double*—positively and negatively—positively, by an imperfect and ambiguous revelation, and negatively, without a revelation, by mental conviction. He is not afraid to call the Deity a double dealer, in other words, a hypocrite. I confess this sounds rather heretically in my ears, notwithstanding the philosophical basis on which it rests. But setting the offence aside, and dealing with the *rationale* alone, it is evident that by this double action Revelation is entirely neutralized, its authority is destroyed, for if God works for it one way, and against it another way, the two opposing forces must bring it to nothing. This is infidelity—a flat denial. I call my opponent, therefore, an infidel.

Counsel for the Defendant.

My Lord—My learned friend calls me an infidel. He is much more deserving of the name than I am, inasmuch as he denies the secret and silent operation of God upon the mind. But in order to avoid recrimination, I shall at present address myself exclusively to the double dealing, hypocritical objection of my opponent. He says I make God a hypocrite! Upon the same principle, you may make a steel hardener a hypocrite, because he first puts the steel into a red hot furnace, and after-

wards plunges it into cold water. This double action Nature has ordained as one of the indispensable means of obtaining a good edge-tool. God is the maker of man; His conduct is not to be judged by the same rules as the conduct of man to man. He must be treated as an artist only, who sees the propriety of employing the furnace of fanaticism on the one hand, and the cold water of infidelity on the other, to bring about the effect proposed. Their intense action is a process of the moral creation by which the human mind is to be ultimately declared the Son of God, and the Divine Image of the Universal Parent. It is by suffering and contention alone that this end is to be obtained, and all the evils which this furious contest occasions in this life are not to be regarded as more than dust in the balance, in comparison with the satisfaction which may hereafter be derived from the deliverance which we shall in due time experience. This happy deliverance I regard as a certainty, because without it the wisdom and justice of God are at variance; with it, universal harmony and beauty illuminate creation, and evil becomes only a thing to be smiled at.

The steel is not made by the fire, neither is it made by the water—the action of both is necessary. So, in like manner, neither is the faith nor the infidelity of direct Revelation a final truth, upon which man can satisfactorily repose, but Revelation, harmonized with universal Nature, of which it forms a part, and brought, like every other science, to the bar of our own judgment, in which God resides, is calculated to increase the happiness of man far beyond what its blind reception or rejection can ever effect. I speak from experience.

The Counsel for the Defendant takes higher ground than the superficial divines of priesthood and popular superstition, who go no farther than the miracle, and the literal doctrine which it teaches. Our counsel goes a step higher, and searches out the purpose for which the literal doctrine itself was mystified, and finds that it was mystified for mental action. The process of inquiry is three-fold, as follows:—*First*, the miracle; *second*, the doctrine; *third*, the object for which the doctrine is mystified. The Clergy, Christians, and Infidels, are content with the first two; the Universalist proceeds directly to the third, and leaves the others in their leading strings.

IDEALISM.

THE progress of philosophy is always from the common realism to idealism. The disputes of philosophers in a superior state of philosophy, are merely those of idealists among each other. Understand, I affix a very broad meaning to this word idealism. I mean the doctrine of those who affirm that external things, as unperceived, are totally unlike the sensations experienced. But there are degrees in idealism, as I shall explain hereafter.

The common realism is that which supports the external world, and exactly corresponds to the sensations. "I know the moon is no larger than a plate," quoth the common realist, "because I *see* it is no bigger." The Cheshire clowns, who are said to have tried to rake the image of the moon, from the surface of the pond, were in this predicament. They had not as yet learned that the senses, to use a common parlance, often deceive.

"According to a common parlance," I say, for never was expression more defective. The senses do not deceive us: it is the inference drawn by the intellectual powers that is wrong. The image of a flower in a looking-glass is just as real, considered with regard to the sense of sight, as the flower itself. What causes them to differ is that one is accompanied by the sensations of smell and touch; the other is not. If we infer from the image that it is accompanied by smell, &c., it is our understanding that makes the wrong inference, and if, when our sight gives us an image, we choose to fancy what is not given, we must not throw the blame on that organ.

But men do not long remain in the condition of the Cheshire clowns: they begin to discover that the oar in the water is not really bent; that a person at a distance is not really diminutive; in short, that, in certain instances, the real thing does not correspond with the sensations.

The advance of experimental philosophy makes us acquainted with more of these instances. The microscope tells us that the dust rubbed off a moth's wing is no dust, but a collection of feathers; that the minute dots we find and swallow in cheese, are organised bodies, continually in motion. The phenomena shown by the glass are totally different from the objects seen by the naked eye; and the experimentalist says, these particles, from a moth's wing, are apparently dust, but really feathers; and, very probably, if some more powerful glass was discovered, these things would turn out to be apparently feathers, but really something else, and so on *ad infinitum*. Not an optician's boy, or a laboratory-sweeper would deny the truth of this.

The science of optics goes still farther; it denies the presence of colour in the things themselves, and says that it merely exists in our own sensations. Scientific men also say that sound, taste, or smell would not exist were it not for some perceiving being. The experimentalists go no farther; the generality do not go so far.

But here all stop, and a division is made between what were called primary and secondary qualities: the former included solidity, figure, and extension; the latter, colour, taste, smell, &c. The former were said to exist in the things themselves; the latter only in the things as perceived by us. Thus, a rose, it was said, was only apparently red, or had a sweet smell, but it really had the shape we perceive in it. A man might go as far as this without causing any great wonderment; but when Bishop Berkeley said the primary qualities were apparent also, the world opened their dull, stupid eyes, and to this hour there are many wise-acres who think the good prelate was little more than a lunatic, though, as we shall presently show, he went the merest trifle further than the generality, and was by no means an ultra idealist.

Let any one draw a circle on the table, and stand with his face over it, while another stands at a couple of yards distance, the former sees a circle, the latter an oval. And who shall judge which is the real form of the diagram? "Oh!" I hear replied, "the real form is the circle, because it is seen by the man who stands closest." "Indeed, friend, you hold your finger a couple of inches from your eye, and look over the way; is not your finger larger than Mr. So-and-so's house?" "Ah; but now I don't see the real size of my finger—it is too close." "My dear fellow, then be so kind as to tell me the happy medium when you see things just as they are." The fact is, what we call the real size or shape of things is merely that in which we are accustomed to see them. The real size of a book is that which it appears at the distance we hold it when reading. A house, on the other hand, we always picture to ourselves as at some yards distance. Again, what we call the real shape of a thing is that in which we generally see it. A mere shaded circle would not be called the real shape of a tea-cup, but yet that is the form presented to our eye if the rim be turned toward us, and is as much a real shape as that caused by any other position.

To revert to our first example, it is very evident that a figure cannot be a circle and an oval at the same time; but yet, as we have shown, one spectator has as good evidence of the real form as the other. Is there any thing impossible in supposing that the real thing, as unperceived, is neither circle nor oval, but that it is an unknown something that impresses a circle and an oval on the senses of the two men, itself being neither? Is there anything impossible in this?—Certainly not.

And with respect to the evidence of feeling, to what does it amount? I see a great brick-coloured surface before me. By an act of my will, I send out my fist towards it, and catch a rap on the knuckles; in other words, I experience a sensation. All the things that I call solid, are merely such that if I approach them, I find a resistance—a sensation. I cannot experience this without a movement on my part; had I not moved I should never have experienced the solidity of the wall; in other words, the wall is only solid to those who approached it, and, perchance, what we call its solidity it may not possess till the very moment of our approach.

And now, to return to Berkeley, what has he said? That there is a power which he calls God, Who, by His will, and without the aid of matter, causes sensations to arise to us. Thus

God wills that the appearance of a white wall shall stand before us, and if we will to move our fist to it, He wills that we shall receive a blow. And yet Berkeley has been called a visionary! then there is even nothing in his theory to excite a moment's surprise. If two men run their heads against a post, and one says his pain is caused by the resistance of inert matter, while the other says it is caused by the action of God, is the latter to be accounted a visionary? He admits the reality of the pain, and what can his adversary prove more?

Berkeley's doctrine approaches Pantheism, while he denies there is any matter. His God is the substratum of all our sensations; in short, is a kind of intelligent matter. Nature with him is no cold, dead thing, with an indolent divinity at repose in some corner—every being he meets is a manifestation of an ever-active, an ever-present Deity. So far he agrees with the Pantheist, but when he gives man a mind totally independent of the Deity, making him quite a distinct being, and, in fact, the only being who is not God, he differs from the Pantheist, who, with his divinity, would embody man also. He requires a step further into idealism; he has to seek an identity of himself with the things he perceives, and so far from thinking Berkeley has gone too far, he finds, on investigation, that he has not gone nearly far enough.

To those who like a dead Nature we leave all the pleasure of imagining a Deity, who has hung the firmament with a parcel of gew-gaws, and has retired to rest; but let us rather consider every star, every flower, every green-tree, to be animated by the great soul of the world, then we shall contemplate the field of nature with feelings really sublime; and though the stars of heaven use neither speech nor language, voices shall be heard among them.

A TRANSCENDENTALIST.

NOTICES OF NEW OR SCARCE WORKS.

An Account of the Manners and Customs of the Modern Egyptians. Written in Egypt during the Years 1832, 4 and 5, partly from Notes made during a former Visit to that Country in the years 1825, 6, 7 and 8. By E. W. LANE, Esq. 2 Vols., 12mo. London, 1836.

Mr. Lane has produced a most interesting and instructive work. It is written in a pleasing, unaffected style; and is brought before the public with strong claims to popularity, being adorned with no fewer than one hundred and seven wood-cut illustrations. The price, however, (twenty shillings) will limit its circulation to the more wealthy classes; so we think that most of our readers will be glad to be entertained with some extracts from it at far less cost.

By his preface we learn that the Author undertook his task in the proper spirit, and in a manner the most likely, in every respect, to succeed. He first studied well the language of the people, so as to be able to converse with them easily and freely: he lived as they lived, cautiously refraining from every action which might give them disgust or offence: he made himself fully acquainted with all their common religious ceremonies; for this purpose, he adopted the Mahomedan dress; and, as he tells us, by freely acknowledging the hand of Providence in the introduction and diffusion of the Mahometan religion, and, when interrogated, avowing his belief in the Messiah, in accordance with the words of the koor-án (Koran, the Mahomedan Bible) as the word of God infused into the womb of the Virgin Mary, and a spirit proceeding from him, he acquired their good opinion, and much of their confidence. Our author concludes his preface with this sentence: "What I have principally aimed at in this work is correctness; and I do not scruple to assert that I am not conscious of having endeavoured to render interesting any matter that I have related by the slightest sacrifice of truth."

According to Mr. Lane, the modern inhabitants of Egypt are composed principally of *Moos'hims*, or Arab-Egyptians, descended from various Arab tribes that settled there mostly after the conquest by Omar, its first Arab Governor; and, inasmuch as they have changed a wandering life to that of citizens and

agriculturists, their personal characteristics have become considerably altered from those of the natives of Arabia. The Egyptian capital (Cairo) must be regarded as the first Arab city of our age, and the manners and customs of its inhabitants are particularly interesting, being as they are, a combination of those which prevail in the towns of Arabia, Syria, the whole Northern Africa, and in a great degree in Turkey; and in no other place could so complete a knowledge of the most civilized classes of the Arabs be obtained.

The third chapter of the work relates to the religion of the *Moos'lims*; from which we extract what probably is a curiosity in this country, the translation of a Mahomedan sermon. The *Khatib* or *Imám* preaches from a pulpit, holding a wooden sword in his hand; the latter, to commemorate the Arab conquest of Egypt by the sword. Mahomedan sermons are usually written in rhyming prose. It will be seen from this specimen that they teach nothing worth knowing, consisting, like those of our own priests, of mere dogmatical assertions, and exhortations to a blind faith. There is one good quality, however, in the one before us, not usually appertaining to the discourses of Christian clergymen, and that is, brevity; though, perhaps, many of our readers will think it barely short enough to be readable.

"Praise be to God, the renewer of years, and the multiplier of favors, and the creator of months and days according to the most perfect wisdom and most admirable judgment; who hath dignified the months of the Arabs above all months, and pronounced that among the more excellent of them is El-Moh-har'ram, the sacred, and commenced with it the year, as he hath closed it with Zool Ilhéggeh. How propitious is the beginning, and how good is the end! [I assert] his absolute glory, exempting him from the association of any other deity with him. He hath well considered what he hath formed, and established what he hath contrived, and he alone hath the power to create and annihilate. I praise him asserting his absolute glory, and exalting his name, for the knowledge and inspiration which he hath graciously vouchsafed; and I testify there is no deity but God alone; he hath no companion; he is the most holy king; the God of peace; and I testify that our Lord and Prophet and our friend Mohammad is his servant, and his apostle, and his elect, and his intimate, the guide of the way and the lamp of the dark. O God! favour and preserve and bless this noble prophet, and chief and excellent apostle, the merciful hearted, our Lord Mohammad, and his family, and his companions, and his wives, and his posterity, and the people of his house, the noble persons, and preserve them amply! O servants of God! your lives have been gradually curtailed, and year after year has passed away, and ye are sleeping on the bed of indolence, and on the pillow of stubbornness. Ye pass by the tombs of your predecessors, and fear not the assault of destiny and destruction, as if others departed from the world, and ye must of necessity remain in it. Ye rejoice at the arrival of new years, as if they brought an increase to the term of life, and swim in the seas of desires, and enlarge your hopes, and in every way exceed other people [in presumption,] and ye are sluggish in doing good. O how great a calamity is this! God teacheth by an allegory. Know ye not that in the curtailment of time by indolence and sleep there is very great trouble? Know ye not that in the cutting short of lives by the termination of years is a very great warning? Know ye not that the night and day divide the lives of numerous souls? Know ye not that health and capacity are two blessings coveted by many men? But the truth hath become manifest to those who have eyes. Ye are now between two years: one year hath passed away, and come to an end with its evils; and ye have entered upon another year, in which, if it please God, mankind shall be relieved. Is any of you determining upon diligence [in doing good] in the year to come? or repenting of his failings in the times that are passed? The happy is he who makes amends for the time passed in the time to come; and the miserable is he whose days pass away and he is careless of his time. This new year hath arrived, and the sacred month of God hath come with blessings to you, the first of the months of the year, and of the four sacred months, as hath been said, and the most worthy of preference and honour and reverence; its fast is the most excellent of fasts, after that which is incumbent, and the doing

of good in it is among the most excellent of the objects of desire. Whosoever desires to reap advantage from it, let him fast the ninth and tenth days, looking for aid. Abstain not from this fast through indolence, and esteeming it a hardship; but comply with it in the best of honors, and improve your time by the worship of God, morning and evening. Turn unto God with repentance, before the assault of death. He is the God who accepteth repentance of his servants, and pardoneth sins."

The following are a few passages from a form of prayer which is recited by the *Imám* after his sermon is concluded. Like the sermon, it has no relation either to charity or good morals.

"Praise be to God, abundant praise, as He hath commanded! I testify that there is no deity but God alone. He hath no companion, affirming his supremacy, and condemning him who denieth and disbelieveth: and I testify that our lord and our prophet Mohammad is his servant and his apostle, the lord of mankind, the intercessor, the accepted intercessor, on the day of assembling: God favour him and his family as long as the eye seeth, and the ear heareth! O people! reverence God by doing what he hath commanded, and abstain from that which he hath forbidden and prohibited. * * * * * O God! pardon the believing men and the believing women, and the Moos'lim men and the Moos'lim women, those who are living, and the dead; for thou art a hearer near, an answerer of prayers. O Lord of all creatures! O God! aid El-Islam, and strengthen its pillars, and make infidelity to tremble, and destroy its power, by the preservation of thy servant, the submissive to the might of thy majesty and glory, whom God hath aided, by the care of the adored king, our master the Sooltán, son of the Sooltán, the Sooltán Mahmood Khán, may God assist him, and prolong [his reign.] O God! assist him, and prolong his armies! O thou Lord of the religion, and of the world present, and the world to come! O Lord of all creatures! O God! assist the forces of the Moos'limes, and the armies of the Unitarians! O God! frustrate the infidels, the polytheists, thine enemies, the enemies of religion. O God! invert their banners, and ruin their habitations, and give them and their wealth as booty to the Moos'lims! [We are glad to learn by a note here that this last intolerant sentence is frequently omitted in this prayer.] * * * * * Remember God, he will remember you; and thank him, he will increase to you [your blessing.] Praise be to God, the Lord of all creatures!"

The religion of the Mohhammadians is one of outward demonstration and ceremony to the fullest extent; and if practised according to the orthodox ritual must engross nearly half the life of a believer. The formulae for prayers and religious purifications, are almost interminable, besides being ridiculous and nonsensical in the extreme. It is incumbent on a Moos'lim to perform a pilgrimage to Mecca once in his life, unless poverty or ill health prevent him; or he must send a deputy, whose expenses he must pay. The fasts are severe enough. During the whole month of Rumadán a Mohhammadian must, every day from two hours before sun rise till sunset, abstain from eating, drinking, smoking, smelling perfumes, and every unnecessary indulgence or pleasure of a worldly nature, and even from intentionally swallowing his spittle. This fast is observed rigidly, except in cases of illness. On certain other days it is unlawful to fast.

There are some good points in the Mohhammadian religion, which, perhaps the Christian clergy may be obliged to adopt, or abide by, at no very distant day. Mohhammadianism does not set up a distinct class of men for religious offices. The *Imáms* obtain their livelihood chiefly by other means than the service of the mosque, their salaries being extremely small. Some of them engage in trade; and many of them are school-masters. All the officers of a mosque are paid out of its own funds; and not by exactions from the people. Yet Mohammedanism, at present, stands firm and unshaken; and no religion can boast of more enthusiastic followers. Mr. Lane tells us that there are very few unbelievers amongst them, and these dare not openly declare their infidelity. Were Protestantism to be put upon the same footing as Mohhammadianism it would tumble to pieces in a year.

Although the duty of waging war with the infidels is repeatedly

urged in the Koran, the modern Mohammadans are by no means a proselyting people. On Mr. Lane's expressing his surprise at this, he heard quoted by way of apology, the following words of their Bible:—"Dispute not against those who have received the scriptures; (namely, the Christians and Jews) unless in the mildest manner; except against such of them as behave injuriously towards you: and say unto them, we believe in the revelation that hath been sent down unto us, and also in that which hath been sent down unto you: and our God and your God is one." Mr. Lane adds: "This precept is however, generally considered as abrogated by that of the sword: if it were acted upon by the Mooslims, it might perhaps lead to disputes which would make them more liberal minded, and much better informed."

* * In our next publication we shall present our readers with some exceedingly curious extracts on the subject of the Superstitions and Magic of the Modern Egyptians.

BEARDS, BARBERS, SURGEONS, AND PARSONS.

THE history of beards would make a much more interesting history than that of murderers, madmen and heroes. But the historical muse has not thought proper to lend her inspiration for the purpose. She is too fond of martial music to spend much of her time in a barber's shop, or if she does occasionally peep in, it is more for the purpose of hearing and speaking of murders, processions, battles and sieges, than of calmly investigating the merits and demerits of parties, customs and habits. What a pity it is that the muse is so foolish! Had the muses been males instead of females, the learning of the world might have taken a very different turn, but it so happens that the originators of literature, the nine muses, were all females! How melancholy! nine young maids most probably! they were so very fond of gaiety and gallantry.

Beards are always represented by poets and historians as emblems of wisdom, and peculiar features of philosophers. Persius calls Socrates a bearded master, (*barbatum magistrum*). All the old philosophers are painted and sculptured with beards, and Esculapius, Hippocrates and Diogenes have got them so thick that no comb could penetrate them. Poets must have been equally as philosophical in former days; for, according to Democritus, (see Horace's Art of Poetry) the greater part did not pare their nails nor dress their beards, and, moreover, did not wash themselves, and the muses excluded from Helicon all poets who were not mad.

—excludit sanos Helicone Poetas

Democritus; bona pars non ungues ponere curat

Non barbam; secreta petit loco, balnea vitat.

If those filthy fellows were the muses favourites, the latter must have been dirty hussies, which accounts for the bad taste which they have infused into the literature of society by dealing so much in the marvellous and extravagant, as entirely to overlook the care of the person, the comforts of domestic life, and the moral regulation of private conduct.

Barbers consequently were no favourites of the muses. They could be of no use on Mount Helicon. Neither shaving nor hair-dressing was there in good repute. This accounts for the sanity of barbers in all ages. Mad Poets are as common as shrimps at Billingsgate; but who ever heard of a mad barber?

Barbers, however, are not less famous for wisdom than the beards of which they make their bread; but their wisdom is of that oral and traditional character which distinguishes the antique from the modern philosophy, for which reason they were greater men in former times than they now are. Shaving was at one time a science. A king's barber was a notable personage at Court, but a king's philosopher was a king's fool. The barber had his own establishment and private fortune—the philosopher lived on the refuse of the royal kitchen. To touch a king's beard was the highest honour that could be conferred upon a man, and to pull a king by the nose was not suitable employment for one of the vulgar. It required a sweet breath and a clean person and graceful deportment to be a shaver of roy-

alty, but a philosopher might say fine things, inculcate good morals, and cause merriment and laughter without any of those accomplishments. Hence barbers have succeeded at court before the idle uncombed and unwashed votaries of theoretical philosophy. The barber is a practical philosopher.

The distinction between theory and practice in philosophy, therefore, seems to be, that theory wears a long beard, and practice shaves it. Theory may beget a science; but it is only practice that brings it forth. Theory is the father, but practice is the mother of it. It was right, therefore, that practice should shave. No one likes to see a bearded woman. Accordingly, we find that as soon as the philosophy of the age began to become practical, beards were discarded as unsuitable to its productive character. Beards now belong to the eastern, and smooth chins to the western world.

The task of womanizing man was by no means an easy one. The greater proportion of men are conservatives, not even excepting the radicals. Philip of Macedon, and Alexander the Great, ordered their soldiers to shave, but they could not order their subjects. It was reserved for Peter the Great of Russia to emasculate a whole nation by a regular crusade against beards. He has not been wholly successful, if we may judge from the bushy whiskers and huge mustachios of the Owskis of Bearland. But this reminds us of an old fact not much spoken of in history, on account of the base propensity of Miss Clio, the historic muse, for sonorous subjects—viz., that there was a long and violent contest between the Greek and Roman churches, regarding this same matter of wearing the beard. The Greek church took the masculine side of the question, and the Roman church advocated the cause of smooth chins. The Russians belong to the Greek church. It is not to be expected, therefore, that they should shave very clean. No wonder the Roman church adopted the cause of the woman, seeing it calls itself "the Mother Church." Gregory the 7th, affirmed that all the clergy of the west have shaved since the commencement of the church. The Greek church still preserves the beard. The contest ended as all other contests do. But the most practical of the two parties is the shaver.

Barbers are the heralds of practical and experimental philosophy. They must have been a learned and a skilful body in former times. An Act of the 1st of Edward IV., after reciting "that several mischiefs had arisen to the subjects of this kingdom through the ignorance, negligence, and insufficiency of divers persons practising surgery, and from the want of a proper examination, correction, and punishment of such persons, incorporates the said barbers, empowering them to make laws and ordinances for the good government of the corporation, and giving them the oversight and superintendence of all persons practising surgery within the city and suburbs of London, with power to punish all such as shall improperly exercise the said mystery, and to inspect their instruments, plaisters, and medicines." This is sufficient proof that barbers were more learned in those days than either physicians or surgeons. In the time of Henry VIII., when the surgeons had waxed strong under the nursing of their *alma mater* (the corporation of barbers), the two companies were incorporated, and diplomas for surgery were given in the joint names of the barbers and surgeons, barbers having the precedence. Even so late as Charles the First's time, a British Navy surgeon being taken prisoner by the French, and put into the prison at Brest, found it very difficult to prove his profession to the governor, who could not determine from his warrant whether he was a barber or a surgeon. It was only in the year 1774, that the two parties were finally separated. Since that time the surgeons having escaped the leading strings and maternal correction, have acted for themselves, and the poor barbers are fast dwindling away into poverty, nonage and dotage—every stripping of a fellow having the presumption to exercise the divine mystery of barbering and shaving on his own person.

But the barbers will not be unavenged. The parsons are meeting the same fate. Every sensible man is now his own parson, and were it not that there is a law in force which authorizes the parsons to shave the people, *volens nolens* willing or unwilling, (a privilege which the barbers seldom enjoyed), they would not be more independent than the barbers. This law, however, is now nearly burnt out; it is already in the save-

all, and the divorce of church and state must follow that of barbery and surgery. Shaving and bleeding are like butter and bacon, rather too powerful a union. So are saving and taxing. *Sacrifices* have long been abandoned by priests as unchristian; but we suspect that a revival of ancient customs must shortly take place.

GALLERY OF PANTHEISM.

GIORDANO BRUNO.

"And I saw being linked with being, and increasing and expanding into an innumerable variety, drinking and feeding upon the *asp* that is never exhausted of strength, and of light, and of life, and of Him who is."—*De La Mennais*.

THE human mind, impregnated with the spark of the Universal Spirit, no sooner becomes conscious of its own being, than it falls down in veneration before that Being which is the universal principle of all existence. This is the first revelation, the revelation of God, the incarnation of the divine word in man.

Man, conscious of his being, and of the being which is the universal principle of all existence, passes from the state of veneration to that of reflection. He endeavours to explain the facts of which he is conscious; he becomes a philosopher.

Philosophy is the love of wisdom, the effort of the human mind to find out the first principles of individual and universal existence.

It is obvious that the first attempts to find out these laws must have fallen out very imperfect; yet, in spite of imperfections and eventual absurdities, the human mind has gradually acquired more and more of a clear insight into the laws of universal nature. These very errors have been necessary steps to higher knowledge.

The errors into which the human mind has fallen may be reduced to two principal heads—Materialism and Spiritualism, Polytheism and Monotheism, Epicurism and Stoicism, Anarchy and Despotism.

This opposition of the fundamental views, which pervades the whole history of man, has created Scepticism.

Man, instead of combining these two facts on which the two opposite views are based, and viewing them as the emanation of one universal principle, gave up, in despair, the attempt to acquire a knowledge of the truth. Hume's Scepticism is nothing but the suicide of the human mind, a self-destruction of the higher qualities.

Yet notwithstanding all the above mentioned errors, the most enlightened in all ages, have acknowledged, the co-existence, and in consequence, the truth of two principles, as the necessary manifestation of the Infinite one. The idea transpires from the mysteries of Memphis, from the sacred books of Hindoo, from the religion of Mythra. It has been even professed by a part of the first Christians, and taught under the veil of allegory by the Knight Templars.

However, it was but in the 16th century that it was proposed publicly as a philosophical system, and the first who professed it was condemned to the flames. Since we call ourselves universalists and Pantheists, and do not make a mystery of our profession of faith; we think it will be useful to our readers, to make themselves acquainted with the life and doctrines of those who have opened us the way to the field, in which we stand as preachers; preachers of a doctrine, which though condemned by the sectarians of all creeds, is the only one which we can commend as conducive in rallying around one altar, all the members of the great family of man.

However, we shall not mention all who have professed Pantheism, we will only devote our pages to those whose works have exercised the greatest influence upon the human mind, namely, Giordano Bruno, Spinoza, Viro, Lessing, Schelling, and Goethe.

We begin our gallery with Giordano Bruno—not because he has been the first among the modern philosophers to profess Pantheism, but because his writings have been the mine which has offered to the German philosophers a world of riches, and

because his opinions are, in many respects, analogous to those professed in the *Shepherd*. The early history of Bruno is involved in mystery: we know only that he was a native of Nola, in the kingdom of Naples, that he studied divinity, and became a friar of the order of St. Dominicus. His ardent mind, nurtured with the study of philosophy, his genius, inflamed with the love of truth, could not bend under the yoke of monkish discipline; he broke the fetters imposed upon him; he gave up the vows of blind obedience and celibacy as irrational; and, assisted in his endeavours by a wealthy and talented Roman lady (Silvia Gandini), he fled to Geneva in 1580.

The republic was then an asylum for all those who were persecuted for their religious creed, or rather, for those who gave up Popery to embrace the Protestant religion. Calvin and Beza were preaching their doctrines when Bruno arrived at Geneva. He was received by both as a powerful auxiliary in the Protestant cause; but soon they discovered in him a most powerful antagonist of all sectism. Bruno was in advance of the age, and stood alone, a free mind among a host of bigotted zealots. He was pointed out as an innovator, and compelled to seek for a new residence.

He directed his way towards Paris, which was at that time a renowned school of divinity and theology. Here he was allowed to give public lectures, but having attacked too boldly the tenets of the philosophy of Aristotle, he drew upon himself the hatred of all divines and schoolmen. He gave up in disdain his professorship, and went to England. Here he found a powerful friend in the French ambassador, Chateaufort, and a warm friend in Sir Philip Sidney. It seems that the English beauties did, for a while, captivate the heart of the philosopher; in fact, he speaks of them in the most enthusiastic terms of praise; he compares them, in respect to other women, to what the stars are in comparison with the earth, and calls them "*Le piu virtuose e le piu leggiadre dame*"—the most virtuous and graceful ladies.

In London he wrote and published his most important works. These works, which, till these last few years, have been a literary curiosity, bought up with gold to be preserved in the libraries of antiquaries, and known merely by the title to the literary world, are written partly in Italian and partly in Latin.

The most celebrated are—

La Cena delle Ceneri,
Lo Spaccio della Bestia Trionfante,
Della Causa Principio ed Uno,
Dell' Infinito e Mondi,
De Triplici Minimo,
De Monade,
De Innumerabilibus,
Degli Croici e Furori—dedicated to P. Sidney.

It seems, however, that a quarrel with a lady caused him to give up his residence in London. In a letter to Chateaufort, in speaking of his own moral courage, he says, "Wherefore I had need to have been of a truly heroic spirit not to submit, depart, or yield to such a rapid torrent of criminal impostures; certainly there wanted nothing but the unkind, foolish, and malicious disdain of a woman, whose false tears are more powerful than the most swelling waves and rigid tempests of presumption, envy, detraction, murmur, treachery, disdain, hatred, and madness."

After leaving London, he stayed for a few months at Paris, and from thence proceeded to Marburg. Here, not being able to obtain a situation, he went to Wittenberg (1587) as professor of philosophy. Here the evil spirit tempted him to give a public lecture, in which he made an apology for the spirit of darkness. The narrow-minded divines of Wittenberg, who believed in the personality of the cloven-footed monarch (and how could the pious Lutherans believe otherwise, since their own lord and master, Martin Luther, had been more than once fighting against the black one, when confined in the castle of Wartburg ?)...the narrow-minded divines, who comprehended as little the dualism of Bruno as the modern sectarians comprehend our universalism, calumniated Bruno as a blasphemer. Enraged, he left Wittenberg, and went to Prague; but whether the love of his native land, or some other no less powerful attraction, acted upon his mind, he returned to Italy. Two years he lived tranquilly in Padua, but having ventured to visit

Venice, he was put into prison (1595). This despotic Government, after keeping him two years in close confinement, handed him over to the Popish Inquisition (1598). The holy tribunal, after having in vain tried all means to induce Bruno to retract his errors, pronounced sentence of death on the 9th of February, 1600.

Here the bold philosopher pronounced the remarkable words: 'Majori forsit cum timore sententiam in me dicitis, quam ego accipiam'—Ye, perhaps, utter my condemnation with more fear than I will show at the execution.

The inhuman sentence was executed on the 17th February, in the same year. Giordano Bruno was burned to death in Campo Fiore, before a crowd of deluded people, who applauded the inhuman sacrifice.

Thus died one of the most talented and bold philosophers. He was condemned by those who worshipped as a Divinity him who, sixteen hundred years before, had been crucified for having taught the same doctrines. He was burned upon the very same soil upon which the thousands of victims had fallen, whom the misguided zeal of the heathen priestcraft had denounced to the authorities as Atheists, Pantheists, rebels, and teachers of immortality.

Let us hear now some of Bruno's doctrines:

"The mind above every thing is God; the mind inherent in all things is Nature; the mind that pervades all things is the intellect. God dictates and ordains; Nature executes and makes; the intellect contemplates and reasons. God is the Monas, the origin of all numbers, the simplicity, which is the substance and excellence of magnitude and composition, above time and space, innumerable and immense. Nature is a numberable number, a measurable magnitude, a momentum which can be assigned. Intellect is a numbering number, a measuring magnitude, an appreciating moment. God flows through Nature in the intellect. Intellect is elevated by Nature to God; God is active love, clearness, light. Nature is the lovable object—fire, heat. Intellect is the loving subject, which is kindled by Nature and enlightened by God.

"Sense is an eye that sees through holes the colours, and outward appearances of things.

"God is the first principle, is that which all things are or may be. He is ONE, but in Him all senses are comprehended; He is the substance of all things, and at the same time their cause. As the first efficient cause, He is also the universal intelligence, which has manifested itself in the form of the universe. To be, to will, to have the power, and to produce, are identical with the great universal principle. His substance and His creative energies are determined by his nature; He cannot act otherwise than he acts; His will is necessity, and this necessity, at the same time, the most perfect freedom. He is in all things, and all things are in Him. All things are animated, all things are good, because they proceed from the one.

"The universe is one—infinite, eternal, imperishable; all things are caused by the division and multiplication of their own principles. But that which we see is but the shadow; indeed, we can see nothing but shadows.

"The end of all philosophy is the recognition of unity existing in contraries.

"The soul forms the body by expansion of the centre. Death is the contraction of the centre.

"The end of human and divine intellect is the same, namely, the perfection of the whole.

"The monas is the centre of the infinite circle, the one and the whole; it is the space, the magnitude, the moment, the primordial existence; a spirit that determines and pervades every thing, a law that rules every thing,

"The monas is the only infinite substance, the number and the measure of all things.

"The dias is the principle of separation and opposition, though this opposition is itself but the subject of unity. It represents in possibility and reality, substance and accident, matter and form, simplicity and composition, union and separation, production and dissolution, external and internal, light and darkness, heat and cold, truth and falsehood, beauty and ugliness.

"The dias proceeds from the unity, as a line proceeds from a moving point. The first division is dichotomous. Hence, each kind of being, or essence, is the compound of two elements,

Hence, we have two souls, two spirits, two laws, two contradictory desires, corresponding to two apprehensive faculties, sensibility and reason.

"All in the world tends towards the end of its nature. But since man is composed of matter and mind, he has two ends—his physical and his spiritual perfection. He is placed between the limits of time and eternity, the spiritual world and the universe. Yet the principal end of man is spiritual, because its existence is infinite, it is the divine principle in man.

"The body, on the contrary, depends on natural laws, is finite, and is nothing by itself. The end of man, concerning his intelligence, is the knowledge of truth, and that concerning his will, the highest goodness (love.) This is proved by the insatiability of his desires, and the continuity of his efforts in seeking for truth.

"The world is infinite; space is also infinite: it is every where; the same matter, the same power, the same effect, the same nature, the same divinity.

"All that is not a first principle and a first cause, has a principle and a cause.

"A principle is the internal ground of existence, the cause the external ground."

These will be sufficient to show the tendency of Bruno's writings. He was an Universalist, in the most noble sense of the word. His philosophy was far from the deadly mechanism of the materialist, and the foamy nothingness of the idealists. His spirit is neither the personification of the sectarians, nor the abstract first cause of the Deists, but an universal, living, all-pervading, all-embracing spirit. The universe itself, the whole nature, is not a casual agglomeration of atoms, but the living, eternal, universal body, of the universal spirit. And to this belief we say—Amen.

HERMES.

VALUE OF EXCOMMUNICATION.

By the 5th and 6th of Edward VI., cap. 4, it is enacted, that persons striking or laying violent hands on any other, either in a church or church-yard, shall be deemed excommunicated, and excluded from the fellowship of Christ's congregation. But by the 53 of Geo. III., c. 127, it is enacted that in all cases where excommunication is pronounced in the Ecclesiastical Court as part of the sentence, the Court is empowered to assign any term of imprisonment, not exceeding six months, all other consequences (temporal and spiritual, no doubt) of excommunication being taken away, and the imprisonment to be enforced by certifying the excommunication and the term of imprisonment to his majesty in Chancery. Such is the value that High Churchmen and Tories put upon excommunication or exclusion from the fellowship of Christ. If Jesus Christ's words are literally true (whosoever sias ye remit, they shall be remitted in Heaven, and whosoever sins, ye retain, they shall be retained in Heaven), excommunication from the visible church on earth is tantamount to excommunication from Heaven, and this is to be bought off by six months imprisonment or three months at the tread mill.

TO CORRESPONDENTS.

"P. P." We are not responsible for the sayings and doings of the Universal Society, 72, Newman-street, any more than for those of the British Parliament. We think it quite enough to bear our own responsibility; and that any man who undertakes more, undertakes too much. If P. P. chooses to go and give his opinion of the divine attributes on Sunday evening, he will find both Spiritualists, and Materialists, we believe, driving plain simple facts to both extremes, but let him not expect either to convince or convert, for this is a world where errors of every description must riot, and the elements of thought contend for ever. Every man adduces some truths, but the infinities of Nature are too vast for the littleness of the human mind. If we could destroy the spiritual pride of mock piety, and the intellectual pride of mock philosophy, and produce genuine humility and simplicity of heart, we would find truth sooner than by wrangling. There is a great deal of affected humility in the world, but no affected wrangling. Men are sincere in wrangling and false in humility, true in their vices, and false in their virtues. But there is no helping it. Men must wrangle till exhaustion comes, it is their fate. Blessed are they who have peace in their own hearts amidst the paltry strifes of external life.

THE SHEPHERD.

EDITED BY J. E. SMITH, A.M.

No. 4. VOL. 2.]

FEBRUARY 1, 1837.

[Price 3d.]

THE PRINCIPLES OF THE SHEPHERD,

MAY be called Pantheism, Universalism, or Catholicism, or by any other word which expresses Universality.

Pantheism implies that every thing, great or small, good or evil, wise or foolish, is the result of the active and conscious operation of the Universal Male (Spirit) in co-operation with the Universal Female (Matter). Consequently, all doctrines, systems, customs, and morals *positively* originate in God and Nature (jointly), and form component parts of a system of progressive training for mankind.

But the only true religion is the acknowledgment of this fact, and the retirement of faith and worship within the true sanctuary of the heart and mind.

THE MOTHER GOD.

We quote the following passage from Godfrey Higgins' "Anacalypsis," a learned and elaborate critico-theological work, lately published:—

"The Jews were correctly followers of the God *Iao* alone. The Romish Christians have along with the God *Iao* adopted the Queen of Heaven the Mother of God, the *Regina Coeli*, as they call her. They are followers of the double principle, and with it they adopt the adoration and use of images. These two (female principle and images) have always gone together. The Protestants refusing the feminine principle, refuse also as usual the use of images. Such is the fact. Are we to attribute this to accident or design? *The female principle and the image do not seem to have any necessary connexion.*"

The last sentence which we have marked in italics, is one to which we principally call the attention of our readers. A careful reader of the *Shepherd* will no doubt smile at the blindness of Mr. Higgins, the connexion between images or material Gods and the feminine principle being so very obvious. According to our Pantheistic theology, the male principle is the universal mind, spirit or soul of Nature—viz., God; the female principle, is the universal body or material manifestation of the male principle, viz., Matter or Nature. The connexion therefore, between image worship, and the worship of the Queen of Heaven is so necessary, that we ought from our own principles to look for the one where the other is established.

The feminine Deity, however, is very imperfectly developed in Popery. A Papist and a Protestant agree upon the Divine Nature. Both regard it as masculine *only*, yet the Bible says, "God made man in his own image, male and female." The Heathens spake more orthodoxly of God. Porphyry says, "that the male and female Deities were all one." Jupiter is represented as both male and female, "Jupiter progenitor Genetrix que Deum," "father and mother of the Gods." We read also in Proclus, of the womb of Jupiter containing all things. Even Venus was sometimes worshipped as a male—*Venus Aphrodite*. The same doctrine prevails in the East. The following words in the *Geeta* are put into the mouth of Brahma. "I am the father and mother of this world, I plant myself upon my own nature, and create again and again the assemblage of beings. I am the generation and dissolution, the place where all things are deposited, and the inexhaustible seed of all nature; I am the beginning, the middle, and the end of all things, * * * the great Brahma is the womb of all those various forms which are conceived in every natural womb,

and I am the father that soweth the seed." This is all sound theology, only like all old theology, it is very indefinite, and does not take the express form and name of the Deification of Nature as the mother God.

The distinction between the divine male and female principle, is merely an arbitrary distinction arising from the imperfection of our minds and our language. It is, however, equally allowable and necessary as the distinction of mind and body, and in this sense only we use it. It is a distinction also so natural, that it has been forced into every language. In the oriental system of Manu, (which Sir Graves Houghton says "is the undoubted prototype of every subsequent system of which we have any knowledge, whether we call them Hindu, Chinese, Egyptian, Persian, Chaldean, or European which are all but distorted and mutilated copies of this one grand, simple, and original conception), 'the order of being is God, mind, consciousness, the *matras*, the elements. This is the order of succession. *Matras* here evidently corresponds to our poetic word Nature. Sir G. says the word *matter* is derived from it, and in Latin, *mater* 'mother,' and Greek, *meter* 'mother,' have evidently the same origin. Mother, matter, and nature, therefore, are synonymous in their universal meaning. These five orders of things are evidently resolvable into two, God and *Matra* (singular), the latter being the immediate producer of the material world, the womb of nature (hence *matrix*). The beauty of the Manu doctrine of nature lies in this, that the *matra* is divisible and becomes plural, *matras*, *natures*—thus corresponding to the infinite varieties observable in creation, to the separate fundamental characters of which varieties we give the name of *natures*, thus we speak for the different *natures* of different animals, plants, &c., whilst we speak also of *Nature* in the aggregate in the singular number. Nature is therefore merely the secondary productive principle of the primary, eternal existence, infinitely diversified for the infinite diversity of her offspring. Taking this view of the subject, we see a great propriety in image worship in the infancy of society, as a representative of the several characters in which the divine power manifests itself, and so far from regarding the Egyptians as degenerate from other nations in their adoration of Deity under the various forms of animal and vegetable nature, we think their worship the result of superior intelligence in their priests and rulers, though perverted like all other religions in the course of time, to the base purposes of ambition and selfishness. Notwithstanding it is a stupid religion, (but not more so than Protestantism, which denies the divinity of nature,) for all types or *matras* must be imperfect, and consequently *evil*, inasmuch as

they are *finite* images of an *infinite* essence. For the same reason the Christian religion is as yet in a state of childhood, inasmuch as it has not got beyond the *divinity* of the *human nature* of Christ, the man-God, whose worship in a Protestant form is not less ridiculous than the worship of the Virgin Mary in a Catholic form. Both are supposed mediators with God, but are representatives also of eternal principles, the one of filial and the other of maternal relationship to the universal father, but both are mere types whose Prototype is God. The Catholic Church is more rich in its types than the Protestant Church is, the only type of the mother God which the latter possesses being in the Sacrament of Baptism, Godfather and Godmother. The Scotch Church the least typical of all has rejected even these.

There were many Christians in primitive times who regarded the Holy Spirit as the maternal principle. According to Origen, the gospel of the Nazarenes or Ebionites represents Christ as saying, "The Holy Ghost, *my mother*, took me up by one of the hairs of my head, and transported me to the great Mountain Tabor." This spirit is evidently the immediate producer or life giver: the finisher of the work begun by the father. The words in the account of the Creation, "and the spirit of God moved upon the face of the waters," should be translated, "and the Spirit of God brooded on the face of the waters," presenting the idea of a hen or she dove, if you will, hatching her eggs. The Hebrew word without vowel points is "rhp." Gesenius, in his Lexicon, says of this word, "to brood as the life giving power of God over the mighty deep at the Creation, Gen. 1. 2 (In Syriac to brood)."

No wonder the idea of the Mother God has forced itself upon the mind in all ages. It is so very natural there is no escaping it, and where it has not been able to establish itself in its full and perfect sense, it has introduced itself typically under the form of the Mother of God, the Virgin Mary, or the Baptismal godmother; even the Scotch, in spite of their typical prejudices, have not entirely got rid of it, as in Scotland, a mother-in-law, that is a wife or husband's mother, is called a "gude mither," or Godmother. But it has never been so perfectly developed within the Abrahamic church as amongst the Heathen (we regard Heathen as an appellation quite respectable). The Abrahamic church is beyond all controversy the first in rank, if not the eldest. It comprehends Jews, Christians, Mahometans. Now the Godmother has never been introduced into this Church, otherwise than typically. The Heathen Theology is full of Goddesses—'*Matres Deorum*' and queens of Heaven—but the Jews were expressly forbidden to have anything to do with them, and the Christians regard the Jewish prohibition as extending to themselves. The Mahometans have an express injunction to the same effect. There is a substantial reason for this. The system of nature presents the grand two fold division of men into spiritualists and materialists, the disciples of the male and female principles. The Jewish Church belongs to the former, and the Gentile to the latter. The plan is evidently to develop these two principles separately, as male and female are separately trained and educated previous to matrimony or sexual love. It is Christ himself who teaches us this doctrine, for he talks of the marriage of the lamb, the establishment of his kingdom being likened to a marriage, and of the bride making herself ready. All this ceremony is antecedent to the establishment of the millennium, and what is the millenium but the union of Jews and Gentiles in one church? But why, say you, excite an antipathy between these two parties? Merely to keep them distinct till they arrive at puberty. The partial union which took place in Christianity was not real, it was like the oriental marriages between infant children, merely nominal. But it has been mistaken for real. Had it been real, we should have had the Mother God in very different style from that of the Virgin Mary, and moreover we should have had Jews and Gentiles incorporated. The incorporation, so far as it has taken place, is to be found chiefly in the Roman Church in sacrifices, images, saints, or minor Gods, and Queen Mary. In the Protestant church, the worship of the man, Jesus Christ, is like shaking the right hand of fellowship with the *material* department. These, however, are merely little bits of nature which have been associated with God—they are *matras* not the *Matra*—they are individual natures, not Nature.

But why does not Revelation teach this great truth in plain terms, and settle disputes? Simple creature! The *use* of Revelation is to create disputes, not to settle them. "Think ye I came to send peace on earth? I tell you, Nay." It is the female principle that settles them; it is the seed of the woman; it is the mother that finishes the child; it is the study of Nature that gives its full development to the mind. Revelation is one thing, and human science is another thing. The former is the male germ of the latter—the latter is the female organizer of the former. It is the mother that gives life and form to Revelation. Revelation has no meaning without science: it is a mere ravel, a chaos, a labyrinth, a raw material. The maternal principle, therefore, does not particularly belong to Revelation in the common sense of the word—(we mean Revelation in the sense of audible communications, miracles, visions, &c.)—in other words, it is interdicted by it until Nature herself reveals it by the maternal species of Revelation—*mental labour*. The *paternal* Revelation costs no trouble, it merely conveys a message to the ear, without caring for the understanding. The *maternal* Revelation is the pregnancy of the mind, with the original elements of truth, striving with all the energies of thought to give them an organized form and living nature. This energy this power, is, however, quite as much of a Revelation as the other. The power is derived from the great source of all power. The mode alone differs from the former, and to these two modes we have given the names of the Paternal and Maternal, in order to show a reason why the mother God has been excluded from the paternal department.

One would suppose, that Nature being most perceptible to the senses, human knowledge, or the search of knowledge, would begin with Nature and end with God; but it is not so—science began with God and the Gods. Natural philosophy is comparatively modern. "Metaphysics," says Sir Graves Houghton, "may indeed be considered as the head, physics as the body, and mathematics as the legs of science." But the end and the beginning are one, for all our inquiries into the laws of Nature are so many searches after the Great Original. Men, however, first went directly to work in seeking after God—*afterwards*, they went indirectly, i. e., through Nature. But it is chiefly in the western world that they have adopted the scientific mode of ascending through Nature to Nature's God. Nature is veiled in the east, and so is woman her image and representative. She is crippled in China, concealed and imprisoned in Persia and Turkey, and regarded as chattel, or private property, in every country of the world. But her veil is partly removed in Europe, for there the secrets of Nature are being discovered, there the mother God is beginning to reveal herself, as alone she can be revealed in the demonstrations of physical science.

But let us close as we began. What is to be the consequence of this Revelation?—*Idolatry*? Mr. Higgins says, and we assented, that idolatry is always connected with the mother God, and employed in her worship. There are two kinds of idolatry—partial and universal. To worship a stone, a stick, or an image, is a religion for children; but to worship universal Nature, the infinite and eternal image of the Father, is a religion for men. This religion we commend to all men; it is the law of God, which is perfect, converting the soul, and making wise the foolish; and yet it is *Idolatry*. But the idol is not made by man, it is immortal, eternal, infinite, Almighty; it has all the attributes of God. There is only one image of the invisible power, and that is the visible agent of that power.

NOTICES OF NEW OR SCARCE WORKS.

An Account of the Manners and Customs of the Modern Egyptians, &c. By E. W. LANE, Esq.
[SECOND NOTICE.]

In the tenth chapter of the first volume, Mr. Lane describes the Arabs as being a very superstitious people, and none of them more so than those of Egypt. Many of their superstitions form part of their religion. They believe in the existence of a class of beings intermediate between angels and men, capable of as-

suming any form, and of becoming invisible at pleasure. The charms used to avert the anger of these genii, and other calamities, are so numerous, according to Mr. Lane, that a large volume would scarcely suffice to detail them. One of the most interesting of their superstitions, is an excessive dread of what they call "the evil eye," that is, the exciting the envy or covetousness of a beholder. From this fear mothers purposely neglect the appearance of their children, leaving them unwashed, and shabbily clothed, particularly when they lead them out in public, so that they may not be blighted by the influence of the "evil eye."

Mr. Lane says he was much amused by the complaint of one of his Egyptian friends, who lamented that the Pacha, having given up his monopoly of the meat, the butchers began to slaughter in their own shops. He said it was quite shocking to see fine sheep hung up in the streets, before the public eye, so that every beggar who passed by coveted them; and that, consequently, people might as well eat poison as such meat. Mr. Lane's own cook made a similar complaint; and rather than purchase from one of the shops near at hand, took the trouble of going to one in a distant quarter of the city, kept by a man who concealed his meat from the view of the passengers in the street.

This piece of superstition calls up in our minds the exhortation contained in the Tenth Commandment, "Thou shall not covet," &c. By the bye, if to covet is a sin, to excite covetousness is doing the work of the tempter. Query—Are not our rampant aristocracy doing this every day in their pompous displays of wealth and luxury before the eyes of the starving poor? Verily, we cannot help thinking, that a little of the fear of the "evil eye" would have a very salutary influence in this country.

We must now go to the magical practices of the modern Egyptians.

In commencing the twelfth chapter of his work, Mr. Lane remarks that "If we might believe some stories which are commonly related in Egypt, it would appear that, in modern days, there have been, in this country, magicians not less skilful than Pharaoh's "wise men and sorcerers," of whom we read in the Bible.

We shall here transcribe Mr. Lane's account of his own experience in these matters:—

"A few weeks after my second arrival in Egypt, my neighbour, Osmán, interpreter of the British consulate, brought him (the magician) to me, and I fixed a day for his visiting me, to give me a proof of the skill for which he is so much famed. He came at the time appointed, about two hours before noon, but seemed uneasy, frequently looked up at the sky, through the window, and remarked that the weather was unpropitious: it was dull and cloudy, and the wind was boisterous. The experiment was performed with three boys, one after another. With the first it was partly successful, but with the others it completely failed. The magician said that he could do nothing more that day, and that he would come in the evening of a subsequent day. He kept his appointment, and admitted that the time was favourable. While waiting for my neighbour, before mentioned, to come and witness the performances, we took pipes and coffee; and the magician chatted with me on indifferent subjects. He is a fine, tall, and stout man, of a rather fair complexion, with a dark, brown beard; is shabbily dressed, and generally wears a large green turban, being a descendant of the prophet. In his conversation he is affable and unaffected. He professed to me that his wonders were effected by the agency of good spirits, but to others he has said the reverse—that his magic is *satanic*. (He is a Pantheist, no doubt!—Ed.)

"In preparing for the experiment of the magic mirror of ink, which, with some other performances of a similar nature, are here termed *durb elmen'del*, the magician first asked me for a reed-pen and ink, a piece of paper and a pair of scissors; and having cut off a narrow strip of paper, wrote upon it certain forms of invocation, together with another charm, by which he professes to accomplish the object of the experiment."

Mr. Lane here gives a fac-simile of the charm, in Arabic characters, with the following translation:—

"Tur'shoon! Turyoo'shoon!—Come down! Come down! Be present! Whether are gone the prince and his troops? Where are El-Ahh'mar, the prince, and his troops? Be present ye servants of these names!"

"And this is the removal. And we have removed from thee thy veil! and thy light to-day is piercing. Correct, Correct."

"Having written these, the magician cut off the paper containing the forms of invocation from that upon which the other charm was written, and cut the former into six strips. He then explained to me that the object of the latter charm (which contains part of the 21st verse of the Looat Ckaf, or 50th chapter of the Kooran), was to open the boy's eyes in a supernatural manner, to make his sight pierce into what is to us the invisible world.

"I had prepared, by the magician's direction, some frankincense and coriander-seed, and a chafing-dish, with some live charcoal in it. These were now brought into the room, together with the boy who was to be employed: he had been called in, by my desire, from among some boys in the street, returning from a manufactory, and was about eight or nine years of age. In reply to my enquiry respecting the description of persons who could see in the magic mirror of ink, the magician said that they were a boy not arrived at puberty, a virgin, a black female slave, and a pregnant woman. The chafing-dish was placed before him and the boy, and the latter was placed on a seat. The magician now desired my servant to put some frankincense and coriander-seed into the chafing-dish; then, taking hold of the boy's right hand, he drew in the palm of it a magic square." (The diagram is here given.)

"In the centre he poured a little ink, and desired the boy to look into it, and to tell him if he could see his face reflected in it. The boy replied that he saw his face clearly. The magician, holding the boy's hand all the while, told him to continue looking intently into the ink, and not to raise his head.

"He then took one of the little strips of paper inscribed with the forms of invocation, and dropped it into the chafing-dish, upon the burning coals and perfumes, which had already filled the room with their smoke; and as he did this, he commenced an indistinct muttering of words, which he continued during the whole process, excepting when he had to ask the boy a question, or to tell him what he was to say. The piece of paper containing the words from the Kooran, he placed inside the fore part of the boys' tackeeeyeh, or skull-cap. He then asked him if he saw anything in the ink, and was answered "No;" but about a minute after, the boy, trembling, and seeming much frightened, said, "I see a man sweeping the ground." "When he has done sweeping," said the magician, "tell me." Presently the boy said, "He has done." The magician again interrupted his muttering to ask the boy if he knew what a *beyruek* (or flag) was, and being answered "Yes," desired him to say, "Bring a flag." The boy said so, and soon said, "He has brought a flag." "What colour is it?" asked the magician. The boy replied, "Red." He was told to call for another flag, which he did; and soon after he said that he saw another brought, and that it was black. In like manner he was told to call for a third, fourth, fifth, sixth, and seventh, which he described as being successively brought before him, specifying their colours, as white, green, black, red, and blue. The magician then asked him (as he did also each time that a new flag was described as being brought) "How many flags have you now before you?" "Seven," answered the boy. While this was going on the magician put the second and third of the small strips of paper, upon which the forms of invocation were written, into the chafing-dish, and, fresh frankincense and coriander-seed having been repeatedly added, the fumes became painful to the eyes. When the boy had described the seven flags as appearing to him, he was desired to say, "Bring the Sooltan's tent and pitch it." This he did, and in about a minute after he said, "Some men have brought the tent, a large great tent; they are pitching it;" and presently he added, "they have set it up." "Now," said the magician, "order the soldiers to come, and to pitch their camp around the tent of the Sooltan." The boy did as he was desired, and immediately said, "I see a great many soldiers with their tents; they have pitched the tents." He was then

told to order that the soldiers should be drawn up in ranks, and having done so, he presently said, that he saw them thus arranged. The magician had put the fourth of the little strips of paper into the chafing-dish, and soon after he did the same with the fifth. "He now said, "Tell some of the people to bring a bull." The boy gave the order required, and said, "I see a bull; it is red; four men are dragging it along, and three are beating it." He was told to desire them to kill it, and cut it up, and to put the meat in saucepans, and cook it. He did as he was directed; and described these operations as apparently performed before his eyes. "Tell the soldiers," said the magician, "to eat it." The boy did so, and said, "They are eating it; they have done, and are washing their hands." The magician then told him to call for the Sooltan, and the boy having done this, said, "I see the Sooltan riding to his tent on a bay horse, and he has on his head a high red cap; he has alighted at his tent, and sat down within it." "Desire them to bring coffee to the Sooltan," said the magician, "and to form the Court." These orders were given by the boy, and he said that he saw them performed. The magician had put the last of the six little strips of paper into the chafing-dish. In his mutterings I distinguished nothing but the words of the written invocation, frequently repeated, excepting on two or three occasions, when I heard him say, "If they demand information, inform them; and be ye veracious."

He now addressed himself to me; and asked if I wished the boy to see any person who was absent or dead. I named Lord Nelson—of whom the boy had evidently never heard—for it was with much difficulty that he pronounced the name, after several trials. The magician desired the boy to say to the Sooltan, "My master salutes thee, and desires thee to bring Lord Nelson: bring him before my eyes that I may see him speedily." The boy then said so, and almost immediately added, "A messenger is gone, and has returned, and brought a man, dressed in a black suit of European clothes; the man has lost his left arm." He then paused for a moment or two, and looking more intently and more closely into the ink, said, "No, he has not lost his left arm, but it is placed to his breast. This correction made his description more striking than it had been without it, since Lord Nelson generally had his empty sleeve attached to the breast of his coat; but it was the *right* arm that he had lost. Without saying that I suspected the boy had made a mistake, I asked the magician whether the objects appeared in the ink as if actually before the eyes, or as if in a glass, which makes the right appear left. He answered, that they appeared as in a mirror. This rendered the boy's description faultless.

"The next person I called for was a native of Egypt, who has been for many years resident in England, where he has adopted our dress, and who had been long confined to his bed by illness before I embarked for this country. I thought that his name, not very uncommon in Egypt, might make the boy describe him incorrectly, though another boy, on a former visit to the magician, had described this same person as wearing a European dress, like that in which I last saw him. In the present case the boy said, "Here is a man brought on a kind of bier, and wrapped up in a sheet." This description would suit, supposing the person in question to be still confined to his bed, or if he be dead. The boy described his face as covered, and was told to order that it should be uncovered. This he did, and then said, "His face is pale, and he has mustachiss, but no beard," which is correct.

"Several other persons were successively called for; but the boy's descriptions of them were imperfect, though not altogether incorrect. He represented each object as appearing less distinct than the preceding one, as if his sight were gradually becoming dim: he was a minute or more before he could give any account of the persons he professed to see towards the close of the performance; and the magician said it was useless to proceed with him. Another boy was then brought in, and the magic square, &c. made in his hand, but he could see nothing. The magician said that he was too old."

Mr. Lane observes that, though completely puzzled, he was somewhat disappointed with the performances, for they fell

short of what the magician had accomplished, in many instances, in presence of his friends and countrymen. He adds, "The reader may be tempted to think that, in each instance, the boy saw images produced by some reflection in the ink; but this was evidently not the case, or that he was a confederate, or guided by leading questions. That there was no confederacy, I satisfactorily ascertained, by selecting the boy who performed the part above described in my presence from a number of others passing by in the street, and by his rejecting a present which I afterwards offered him, with a view of inducing him to confess that he did not really see what he had professed to have seen. I tried the veracity of another boy on a subsequent occasion in the same manner, and the result was the same. The experiment often entirely fails; but when the boy employed is right in one case, he generally is so in all. When he gives, at first, an account altogether wrong, the magician usually dismisses him at once, saying that he is too old. The perfumes, or excited imagination, or fear, may be supposed to affect the vision of the boy who describes objects as appearing to him in the ink; but, if so, why does he see exactly what is required, and objects of which he can have had no previous particular notion? Neither I nor others have been able to discover any clue by which to penetrate the mystery; and if the reader be alike unable to give the solution, I hope that he will not allow the above account to induce in his mind any degree of scepticism with respect to other portions of this work."

These things are very extraordinary and wonderful. Mr. Lane says he cannot penetrate the mystery. Nor can we: we can only confess the mystery. The only rational way to account for these phenomena is the supposition that Nature confers such gifts occasionally to keep alive the discussion of the question of a spiritual world: There is no absurdity in this acknowledgment: the powers of Nature are not to be limited by man. We have no doubt that all countries can produce their sooth-sayers and magicians. There are many in England. We ourselves knew one crystal seer in this country whose performances were equal to the Egyptian magician; but it makes sham philosophers mad to mention such things.

FOI ET AVENIR—FAITH AND FUTURITY.

BY JOSEPH MAZZINI.

Bienne, imprimerie de la Jeune Suisse.

THE heart of the friend of mankind must thrill with joy on seeing that the new generation, in Europe, abandoning the dreary track of hackneyed political discussions, begins to soar in the higher spheres of social and moral regenerating principles. Joseph Mazzini, of Modena, stands, as it were, at the head of this new generation, and his book bears the stamp not only of a lofty genius, but of a heart that throbs with love for the whole race of mankind. And yet this noble-minded philanthropist is an exile, nay, he is even more than an exile, he is literally outlawed, his head is in jeopardy; he is compelled to live in solitary concealment in the land of Tell and Winkelried, changing from day to day his name, his abode, his garments, to avoid the snares of the mercenary and degenerated governments of Switzerland, who, corrupted and bribed by the Austrian and French despots, would, surely, upon his detection, hand him over to his blood-thirsty persecutors.

But let us throw a glance upon this remarkable work; let us present to your eyes the manifestations of Mazzini's prophetic soul.

"The Crusade is organized; royalty takes the field. It appears clothed in the armour of the middle ages, with a feudal planet, and a sword of the sixteenth century. It is prepared for war. A little while ago (1830), when the nations were panting for liberty, royalty thought itself undone, and it was literally undone. We have saved it! We have forgotten that the day which succeeds victory presents more danger than that which precedes it; we have allowed ourselves to be led astray by the pride of the conquest; we have gathered the rubbish of a half-destroyed diplomacy, and built it up again amongst us.

"Royalty was unsaddled, and we, like the knights of the middle ages, have gone two steps backwards to allow it to get again on horseback. And it mounted the steed again; it set itself again to work; and it has worked with so much constancy, abrogation, and activity, as to make us ashamed of our want of unity and energy, and to stop, indeed, to make retrograde, if possible, the march of our century.

"But now, what is to be done? Shall we lose our courage? shall we cringe for a while, and renounce our generous endeavours, and begin anew the comedy of fifteen years, assuming the tenore of hypocritical slaves, and wait for the opportunity of assailing treacherously our enemy in the back, and kill him like cowardly assassins?

"Those who advise this plan as the only remedy for our misfortunes, mistake our mission, and are ignorant of the end which the nineteenth century is called to accomplish. It is not enough to destroy the despotic power: it is necessary to build upon its ruins a new edifice. It is but the work of a moment to destroy or to elevate anew the royal power. Napoleon had destroyed ten kingdoms, and yet they were built again before his ashes were collected in the solitary tomb. Three days were sufficient to expel a dynasty that had ruled for six centuries over the French; but royalty sprung up again in a new branch with additional power.

"The comedy of fifteen years has been admirably played; but what has been the issue of the play? This play has dethroned the elder branch of the Bourbons, but it has killed and unnerved the male revolutionary energies which had placed France at the head of the nations of Europe. It has demoralized both the government and the nation; it has exchanged the battle-axe of the Gauls for the cloak of the Jesuits; it has replaced enthusiasm with calculation—genius, by cold reasoning; it has stifled the grand republican and national ideas under a heap of beggarly, mean half measures.

"The nations are wanting faith. We are undone as a political body: we must rise again as a religious party.

"The religious element is universal and indestructible; it is everywhere and in every thing; it generalizes and unites. Every real revolution is stamped with a religious character. The religion which we are called to form is the Catholicism of mankind—the universal association of the nations. With the gospel in our hands, we march towards the great object of Christianity. We seek for this new gospel, of which the old one was a mere type, as man is the type of the whole mankind.

"We greet, with Lessing, this approaching epoch, in which the axis of the universe will pass from God to mankind. We shall march as martyrs upon that road which has been pointed out some centuries ago, until we shall see accomplished that end which is the peaceful association of all mankind; where there is but one God, one religion, one law for all the human species, where the principle of egotism and individuality dies away to give place to the principle of universal fraternity. We come in the name of God and Humanity; we believe in an only God, the originator of all that is living and absolute thought, of which our world is a beam, and the whole universe an incarnation.

"We believe in one universal, unchangeable law, from which our mode of existence is depending, which encompasses all the possible physical and moral phenomena, and exercises an action upon all the universe. We believe in the *association* (social reform), which is nothing but an active faith in one God, in one law, in one common end, as the only mode of our progress. Hence, we believe in the *holy alliance* of the nations, as the largest association which we are able to comprehend, in the liberty and equality of the nations, without which no alliance is possible, in the nationality, or individual consciousness of the nations, and in a holy father-land, the cradle, the arena, the focus of all individual exertions. When all the altars of the old world will fall under the efforts of the progressive endeavours of Young Europe, two altars alone will stand upright.

"On the side of the one will appear engraved with golden letters, 'The Father-land,' on the other 'Mankind.'

"Lofty ideas are the makers of great nations. Concentrate your existence in one great creative thought; enlarge the horizon of the masses; lift up their conscience, curbed down by

materialism; show them a higher mission; baptize them anew. The material interests originate but partial and idle commotions.

"Universal principles alone are capable of producing a permanent regeneration. Study universal principles, then the masses will follow your standard. The present question is a religious one. Analysis and anarchy have killed the energy in the heart of nations; synthesis and unity of faith will kindle their hearts with new energies.

"Then will vanish all contractions, which fill our hearts with disgust and shame, which unnerve the partisans of progress, which prompt the mock patriots to stigmatise with the name of 'foreigners,' those martyrs who roam in exile in strange countries. With these contractions will also disappear that retrograde fascination for old names and old theories, that hostile polemic of parties, that hatred of man against man, of school against school, of journal against journal, and that inhospitality, against misfortune and exile. Faith, which is nothing but love, good will, and intelligence, will obliterate all that, and harmonize all discord, which is the offspring of a society without social end, without social unity; which goes pregnant with a new world, but is incapable to bring it to light for want of a universal principle of life.

"Some centuries ago the times were also dark, the sky empty, the nations strongly agitated, or stupidly motionless. Some nations disappeared, whilst others arose to behold their fall. A murmur was heard in the world, a murmur foreboding destruction. Heaven and earth both were trembling; man offered a wretched appearance. Placed between two infinities, he had no conscience of the one or the other, he did not comprehend what had passed before him, nor what had to come. Men did not believe any more in their God, nor in the republic. They had no belief of any sort. Society was no longer in existence. The government was weltering in blood, or prostrated in debauchery. The senate, a mockery of the past majesty, existed only to protect itself from the tyrant, to whom it voted millions of gold, and statues. Pretorians killed one despot to elevate another to the throne? Spies, sophists, and the enslaved many, whose desires were bread and public shows. There were no principles; material interests were the only objects of discussion. The Father-land was no more. Brutus's last words were 'that there was no more virtue in the world extant.' Honest men met a voluntary death, to avoid the contact with the general corruption. Nerva allowed himself to die of starvation. Thraseas made with his own blood libation to the free-making Jove. Philosophy was first scepticism, then epicurism, and finally nothing more but empty talk. Poetry had degenerated in satire; yet there were moments in which man found himself desolated and forlorn. Screams of terror interrupted the stillness of the night. Men ran to embrace the cold statues to elicit, as it were, from the cold blocks of marble, some spark of moral life, of faith, of illusions. Such were the times to which our's are so much akin.

"Yet, all that was not the agony of the world, it was the end of one of the evolutions of mankind, after having obtained the maximum of expansion.

"A great epoch was gone to give place to another. A new regenerating high priest was to appear: he came. It was a soul full of love, full of divine inspiration, and of prophetic spirit. It was Christ. He had bent himself upon this world; which had become a corpse, and uttered some words of faith. He took this clay which had nothing more of human but the shape and the power of motion, and pronounced some words which were never heard before—'love, sacrifice, divine origin.' And the corpse rose up. A new life circulated in the clay—a life which all the philosophical systems could not breathe in its nostrils. From this clay issued the Christian world—the world of liberty and equality; from this clay issued the new man—the type of progressive mankind, of general association. Walk in faith, you who suffer for the noble cause; apostles of truth, you whose sacred endeavours are branded with the name of Revolutionists. What Christ has done, mankind will be able to do likewise. Believe and act—action is the word of God.

"One day in the sixteenth century, some men called inquisi-

tors, who pretended to be appointed by God himself to control the efforts of human intelligence, and called themselves 'Inquisitors,' were assembled in Rome, to decree the immobility of the earth. A prisoner stood before them; the beams of genius sparkled from his eyes; he stood above his times and his contemporaries; he had revealed the mystery of the world.

"It was Galileo.

"The venerable old man shook his head; his soul was revolting against the violence of his oppressors, and yet, curbed down by the monkish despotism, he was ready to retract the truth he had discovered; but, in lifting up his hands, his fatigued eyes beheld that canopy of Heaven in which he had read so often the laws of the universe. Remorse stung his heart: a voice escaped involuntarily from the depth of his soul: he said '*appur si move,*' and yet it moves.

"Three centuries have elapsed. Inquisitors, inquisition, absurd doctrines upheld by brutal force, all have disappeared—nothing has remained but the undeniable truth of the movement of the earth and the memory of Galileo.

"Raise your eyes to heaven, ye children of mankind, and read in the stars 'Indeed it is progressive.'—Faith and action—futurity is for us."

ON MATTER.

"So man nennt Himmel und Erde, Sterne, und Elemente, und Alles, was darin ist, und alles, was über allen Himmeln ist, so nennt man hiemit den ganzen Gott."—*Böhme.*

If we name heaven and earth, stars and elements, and all that is therein, and all that is above all heavens, we, by by so doing, name the whole God.

The first notion of matter was that of something solid. If a man advanced towards some phenomena offered to his eye, he met with a resistance; and phenomena which were attended by this sensation of resistance, were called solid. There was a great resemblance between the different sensations of resistance, and they all had one quality, in common, that of impeding progress; hence they were all supposed to be caused by a substance called *matter*, whose leading attribute was solidity.

So far so good. If by matter nothing more is meant than a something which resists, the severest idealist will not dispute its existence. If he runs his nose against a wall, he is just as ready to admit that his progress has been impeded by something not subservient to his will, as the severest materialist; but when the latter begins to give matter attributes of which none of his senses have informed him, and dogmatically says, he is warranted by those very senses in so doing, the idealist, very properly, bids him good bye, and thus two sects are formed.

Well, then, the primitive people having found they could not walk through chalk cliffs, nor run their fingers through stones, said they were resisted by matter. But presently logic arose, and found the following proposition universally admitted—"Matter is solid." The logicians saw they could separate the subject from the predicate,* and said, "Oh! yes, matter is solid, but solidity is only one of the qualities of matter. We ask what is *matter* itself, this thing which is solid?"

From this moment matter assumed an entirely new character: solidity, instead of being looked upon as the very essence of matter, was regarded as an inherent quality; and then, an adequate definition of matter was no very easy *matter* to find. It was not solid in itself—oh dear, no: solidity was only inherent, and all colours, forms, &c. were only inherent. But,

* A proposition is said by the logicians to consist of three parts—the term expressing the thing spoken of, the term expressing that which is spoken of the thing, and the verb which joins them. The first of them is called the subject; the second, the predicate; the latter, the copula. Thus, in "man is an animal,"—*man* is the subject, *animal* the predicate, and *is* the copula.

then, what the deuce was this something in which so many qualities inhered?

First of all, recourse was had to analogy. "Look at this table," said somebody; "now turn your eyes to this chair, and finally look at that board. They are all wood in different forms, but yet the existence of wood does not depend on the existence of a chair, or a table, or a board—no; wood is distinct from all these forms, but yet is capable of receiving any of them. Thus it is with matter. Matter is neither solid, nor of any shape, nor any colour, but yet it is capable of receiving solidity, and shape, and colour."

This illustration could not fail to enlighten all who heard it. They looked at wood in all sorts of shapes, and if any had been lucky enough to have seen a bit of wood of no shape at all, he would doubtless have been still more enlightened than his brethren. We much fear, however, such a highly-favoured individual was never found, either in ancient or modern times.

"Agreed!" I hear some one cry out; "we cannot see this original matter, but we can think about it." Very good; if you can think of something neither possessing consciousness nor figure, nor weight, nor—nor—anything! you have a faculty I am not so happy as to possess; and, I must own, your thinking seems to me very like thinking of nothing.

This, then, was said of matter. [I must excuse us for giving his Greek quotation in Roman type, for, however wise the Greeks might be in the use of language, the Roman letters have beat the Greek in universality.—ED.] "*Toproton hypokeimenon dunamenon hapasas dechesthai tas morphas en steresei men estin hapasown.*" (Themistius).—*The primary subject, able to receive all forms, exists in a want of them all*—a proposition which sounds very well in words, but which really conveys no impression whatever. The divine Plato, who was an idealist at heart, but found the assumption of matter necessary to explain his views of the origin of evil, found he had assumed something rather difficult to apprehend. He confessed it was "*dusalowtotaton*," by which he meant it was very hard for the mind to catch, and, we might add, with Joe Miller's horse-dealer, good for nothing when caught.

Still, however, not one of them dreamed that, in thinking of matter, they were thinking of nothing—all imagined they had some kind of faint idea. The learned James Harris, who was deeply imbued with the antique philosophy, and who, by the way, is not half so much read as he deserves to be, says—"We gain a glimpse of it (the primary matter) by abstraction, when we say that the first matter is *not* the lineaments and complexion, which make the beautiful face; *nor yet* the flesh and blood, which make those lineaments, and that complexion; *nor yet* the liquid and solid aliments which make that flesh and blood; *nor yet* the simple bodies of earth and water, which make those various aliments; but *something* which, being below all these, and supporting them all, is yet different from them all, and essential to their existence."

This *something*, as I before hinted, is so amazingly like *nothing*, that I cannot tell the difference between them. Indeed, a cypher seems the most apt symbol to denote matter, according to the above view. A nought [0] may be made out to be the substraction of all numbers, for if you subtract every single one from any number, 0 will remain, and thus the first matter is supposed to be the residue, after deducting all sensible qualities. In the same way 0 is in itself no number, but yet is capable of having any number added to it—e.g. $0 + 1 = 1$, $0 + 2 = 2$, and so on.

But this 0 is not a symbol of any conception—it is merely of use in arithmetic and Algebra, to express the result of certain abstract computations; and if we imagine we are forming an adequate conception of "*nothing*," we are thinking of the little round figure 0, or perhaps the letters which compose the word "*nothing*," which really are very distinct "*somethings*."

Thus is it with the primary matter. Persons fancied they could think of it, when they imagined a variety of different forms, and then talked of something common to both, or when they thought of the word "*matter*," or the Greek word "*hulé*." The expression I used above, "*thinking of nothing*," was not intended to imply that a person could think of nothing, but

merely that he would do so, if he could think of the first matter,—a power which I utterly deny.

The only use of the assumption of matter in modern times (for Plato's ethical use no longer exists), is to explain the resistance we meet with from external objects. That we are resisted is an indisputed fact, and by objects which are not at the mercy of our own will, and this our senses inform us daily; but they inform us of nothing more, they give us no insight into the cause of resistance—the real resisting power may as well be a being possessed of consciousness, like ourselves (and much rather so, as we may show at some future time), as an infinitely stupid and senseless matter.

A remark has just struck me, which does not immediately bear upon the subject, but as it is connected with the senses, I cannot refrain from inserting it. The sense of touch is not the only one which manifests a resistance to our will,—all the senses do the same. Thus, if we look at a white wall, our sight is bounded by this whiteness—we cannot at our will turn it into blue. If we look in that direction, we must see white, and nothing else. If a cannon be fired, our sense of hearing is bounded beyond our power of firing it, and we cannot, at our will, hear the sound of a flute instead. Hence, when I say I see a colour, I mean my sense of seeing is bounded by that colour; and hence follows this remarkable corollary:—“*Our senses are only of service so far as they curb our freedom.*”

If the *Shepherd* has no objection, I shall continue these subjects from time to time. Originality I do not pretend to. The opinions I put forth will be found in the writings of Greek, German, and English philosophers—my chief object being to call men to think, and doubt on those subjects they have most taken for granted.

I shall conclude with the following passage from Descartes:—“*Quoniam infantes nati sumus, et varia de rebus sensibilibus judicia prius tulimus, quam integrum nostrae rationis usum haberemus, multis prejudiciis a veri cognitione avertimur; quibus non aliter videmur posse liberari, quam si semel in vitam, de his omnibus studeamus dubitare, in quibus vel minimam incertitudinis suspitionem reperimus.*” Since we were born infants, and formed various judgments on sensible things, before we had acquired the mature use of our reason, we are diverted from the knowledge of the truth by many prejudices, from which we cannot liberate ourselves, unless, for once in our lives, we strive to doubt on all those subjects, in which we find was the slightest suspicion of uncertainty.

A TRANSCENDENTALIST.

S. T. COLERIDGE—GARDEN TALK.

Meminisse Juvabit.

It was on a beautiful morning in the month of May, 1824, when the carriage drove us from Portland-place; a thick mist was spread like a veil upon the town, but we had scarcely crossed the New-road, when the blue sky smiled like the eyes of a hopeful bride over the earth, and the beams of the morning sun, spread the glowing element over renewed nature: soon the meadows displayed their brilliant verdure before our view, and in a little while we had crossed the plain, and were at the foot of the hill that leads to Highgate. While the horses were panting in mounting the hill, my friends pointed to the right, and showed me the summer residence of the richest widow in the kingdom; “that is Mrs. C.’s residence,” said a lady to me; “I think you have heard us speak of her, and of the way that she became possessed of her immense fortune. He to whom she owes her wealth, was a relation of ours.” “Surely,” answered I, “I have heard of Miss M.,” and this is one of those instances which confirms the opinion that England and the English are an enigma that we foreigners are unable to unriddle.

How should I have been astonished if I had then supposed the same lady would a few years after be allied to a Peer of the realm!

In the meanwhile we had reached that small place of H. which is called the Grove, and we alighted at Mr. Gillman’s. We were introduced into a pleasant parlour, where the host and the hostess, Mr. and Mrs. G., received us most cordially. “Mr. C. will be here presently,” said the amiable lady, “he has told me he expected the visit of friends, who wished to introduce to him a foreign gentleman.”

A few minutes after Mr. C. made his appearance. Never shall I forget the impression he made upon me. There is something in a man of genius that reveals itself at the first glance to him who has sympathy for that which is grand or beautiful; it inspires us with confidence and admiration, and makes us feel as if we stood near one with whom we have been connected for years.

The conversation soon became very lively, and the venerable poet soon began to pour out one of those torrents of eloquence which carry away the attention of the listener, and make him forget both time and space.

When Sir I. S. looked at his watch, he saw that we had remained there longer than we intended. We then arose from our seats, and took leave both of Coleridge and the excellent couple, who, full aware of the worth of Coleridge, at an epoch when the fashionable world scarcely knew his very name, had received him as an inmate in their house, and taken that care of him which dutiful children only take of a respected aged parent. May the idea of having thus repaired the injustice, and indifference of our contemporaries, towards one of the most eminent geniuses of our age, fill their bosom with eternal bliss!

We did not leave the house without visiting the garden, which was a favourite place of our poet; here he took me under his arm, and we began to converse together in German. Coleridge spoke this language quite correctly, and with a soft Hanoverian accent. German literature stood highly in his favour; this sympathy for the German was only equalled by his aversion for the French. He seemed to take so much interest in me, that he made me promise to be with him the next day one hour or two before the company which was wont to visit him, did assemble. “We shall,” said he “have a private talk here in the garden if the weather be fine, otherwise you will excuse my taking you in my room, which is my place of rest, my study, and my library.”

On returning home, Mrs. W. the sister of the noble baronet, who introduced me to C., asked me how I was satisfied with my new acquaintance. “Satisfied,” answered I, “I am delighted, enraptured; I find concentrated in him all the talents which I have left with regret on the continent. As a poet, he reminds me of Schiller, as a philosopher, he equals Schelling, and as a speaker, he excels Fichte. As far as I could judge of those different talents combined together, he stands between Goethe and Lessing. I shall see him to-morrow, and I expect a great treat from a private conversation which he promised me.”

Accordingly I went, and my visits were repeated at least once a week for two years running, when by a series of mishaps I was obliged to leave the metropolis.

I think to do a great service to the literary world, to publish, through the medium of the public press, the recollections of these most interesting conversations. They will form a kind of supplement, and even of commentary to C.’s Table-talk, and to other publications.

HERMES.

The following letter, printed from the autograph of S. T. C., shows at once the intimate relationship that existed between the writer of the *Garden Talk* and the noble Poet, and will serve to convince the public that this author had the opportunity of conversing with him upon topics of the utmost importance:—

“My Dear Sir,—For as we both speak from the heart, we will both in our occasional epistolary intercommunication employ the most suitable vehicle for its utterance, our mother tongues.—If ever in my life I wished to be a man of fortune, if ever I was out of humour, and malcontent with my poverty, and with the dispensations of Providence, which has made it my fate to live (in our idiomatic phrase) ‘from hand to mouth,’ or to quote my own words from a poem published in 1798, or 1799, and which are as true now as when first written,

‘I partaking of the evil thing,
With daily prayers and daily toil,
Soliciting for food my scanty soil,’—&c.

it has been since I became acquainted with you. But I am in my own country; I have many sworn friends; and I have some influence, and though (I dare affirm) disproportionate to what it ought to be, at which you will not wonder when you know that during five and twenty, I might say thirty years, I have been resolutely opposing the whole system of modern illumination, in all its forms of Jacobinism, and Legitimation, Epicurean, (in our country Pelagian) Christianity, Pelagian morals, Pelagian politics, and 'casting my bread on the waters,' yet, 'after many days,' I have begun to find it, and therefore, I may venture to add that I have a growing influence. Now be assured, that whatever I could do for a brother, I will do for you. Nothing shall be lost for want of *effort* on my part. But some time must elapse before I can have talked, consulted, and written to my friends, though I hope *shortly* to be able to send you some present and temporary assistance. I shall read with great interest the works you have sent me, and as soon as my *Aids to Reflection* have left the Printer's office in the shape of a volume, I will send you all such of my works as are not out of print.

"I now write for no other purpose but that dictated by the belief that it will be a comfort to you to be re-assured that you possess one most sincere well wisher and sympathising friend in

"S. T. COLERIDGE.

"Grove, Highgate, May 14, 1825.

"P.S.—I am more and more delighted with G.B. Vico, and if I had (which thank God's good grace I have not) the least drop of *Author's* blood in my veins I should twenty times successively in the perusal of the first volume (I have not yet begun the second) have exclaimed: "Pereant qui ante nos nostra dixerunt." By the bye, when I see you on Thursday I will mention a set of articles, on which I myself for a long time had set my thoughts, a critical and biographical account of the great revolutionists in the intellectual world, philosophical and religious. I am pretty certain that I could dispose of them, so as to make it worth your while, and at more than a common booksellers honorarium to the *Quarterly Review*, and other works of extensive sale, and which would not at all prevent your afterwards collecting and publishing them in a volume. God bless you! mention my name with all respectful kindness to Mrs.—

"HERMES."

JERUSALEM AND THE JEWS.

THE Pacha of Egypt has granted permission to the Jews to assemble and worship God in their own way, in the "Holy city of Jerusalem." This took place last September, and is such a novelty in the history of that long scattered and faithful people, that it seems to be the beginning of a national gathering of the dispersed of Judah. We have no doubt that this gathering will yet take place. We do not suppose that the Jews will cease to traffic, as usual, in all parts of the world, but we think they may very soon have a country and a capital of their own, with which the whole people may correspond. If so, Jerusalem will be better adapted for the acquisition of information, from all nations, cities, and tribes, than any other city in the world. It may yet be queen of cities. "And thou, oh tower of the flock, the strong-hold of the daughter of Zion, unto thee shall it come, even the first dominion." So wrote a Jewish prophet, more than two thousand years ago. The fulfilment of the prophecy seems not improbable even at the present time. What a novelty it would be in the History of London Docks and Steam Navigation, to see the London Jews embarking for the Holy City, every man with his bullock or calf of a year old at his side, to offer to the Lord as a burnt offering, and to the priests as a sweet smelling savour!—novelty indeed! But, although Jerusalem is open to them, Mount Zion is not theirs, and the Lord will not accept of burnt offerings and sacrifices from any other place. They must be content with synagogues for a while.

BURKISM.—CURIOUS RELIGION.

IN the last number of the *Edinburgh Review* is a most interesting account of a religious sect in India called *Thugs*, whose

first and most sacred duty to God is the strangling of their fellow-creatures. They are a large, secret, and *respectable* society, and in every respect, but this one peculiarity, are good, amiable, and intelligent people. Like all other sects, however, they have orthodox and heretical doctrines amongst them, and one of their controverted points is, whether they are at liberty to spare a victim, when the omens or auspices of their superstition are favourable. The modern heretics say yes, and the pious and evangelical party, who espouse the opposite opinion, ascribe to this degenerate apostasy the persecution and active inquisition of the British Government, which now threaten their total extinction. Their defence of their conduct is by no means amiss. They say that all their victims go straight way to heaven, and they have as great an abhorrence of common murder as other people. They have also their martyrs and special divine judgments upon their enemies, which would make a curious appendix to Fox's Martyrology.

TO CORRESPONDENTS AND READERS.

Several of our Correspondents have complained of the second part of the *Shepherd*, as being unnecessary, and merely increasing the price to no purpose. We mean to humour them, next Number, by taking it away, and charging twopence.—However, they are much mistaken in supposing that the additional sheet has enlarged the price. We announced the *Shepherd* at threepence, before we thought of the second sheet, and we meant to make an experiment of threepence for four Numbers, with only eight pages. The additional sheet has been entirely gratuitous. It is also, in our opinion, useful, inasmuch as it consists of light reading, which has a tendency to remove sectarian, national, and provincial prejudices, and open the heart to universal and liberal principles. It is calculated to captivate the attention of those who are not disposed to enter into the niceties of abstract speculations. It is useful for children and the mothers of families, who would not read a page of our metaphysical and theological disquisitions, and we have no doubt that we shall offend many by its discontinuance. But, as the *Shepherd* is our principal charge, we do not hesitate a moment which party to please and displease. We meant to have printed a variety of really useful little works, with editorial comments at the end of each—not professing to give new productions, which are not to be found on the shelves of common libraries, as one of our Correspondents complains, but such as, collected together in one volume, would exhibit a mass of admirable moral instruction, in conformity with our own principles. One Correspondent even complains of the cover and advertisements. We shall never yield upon that point. The cover keeps the work clean, and surely no one will begrudge us the opportunity of issuing a few advertisements—those who do, are not friends.

We shall make no farther alterations. We commend and entrust the work to God and the people; and whatever be its fate, we are not the party that shall utter a complaint. We have no shadow of doubt that principles similar to ours will rapidly grow; indeed, we see the dawning of them throughout the whole press. They have not yet got a designation, or a form, but they break out on every side, and from men of all parties, whenever a large and promiscuous assemblage of individuals is addressed. No man can address the public in the name and spirit of an exclusive of any sort, whether it be Catholic, Protestant, Jew, Infidel, or Atheist. He must throw a veil upon all such peculiarities of creed, and assume the spirit, if not the name of a Universalist, if he wishes to touch the chords of sympathy that blend the feelings of a heterogeneous mass of human beings into one. This single fact is enough for us; it is an omen of ultimate success; indeed, it is a proof that though unknown as a creed, or profession of faith, UNIVERSALISM really exists in the human heart, concealed by the artificial systems of men, but ready on all public occasions to shed forth its generous beams, and extinguish the glimmering tapers of petty sectism for a time. It comes forth at times to show its power: by and bye it will reign.

THE SHEPHERD.

EDITED BY J. E. SMITH, A.M.

No. 5.]

FEBRUARY 15, 1837.

[Price 2d.

THE PRINCIPLES OF THE SHEPHERD,

MAY be called Pantheism, Universalism, or Catholicism, or by any other word which expresses Universality.

Pantheism implies that every thing, great or small, good or evil, wise or foolish, is the result of the active and conscious operation of the Universal Male (Spirit) in co-operation with the Universal Female (Matter). Consequently, all doctrines, systems, customs, and morals *positively* originate in God and Nature (jointly), and form component parts of a system of progressive training for mankind.

But the only true religion is the acknowledgment of this fact, and the retirement of faith and worship within the true sanctuary of the heart and mind.

THE DELUSIONS OF SCIENCE.

THERE is a very great difference between wisdom and knowledge. Knowledge is compatible with vice and licentiousness. Wisdom is the source of virtue and happiness. There are ignorant men who are wise, and men of learning who are fools.

Science is obtained by reading, and hearing lectures. Wisdom is obtained by experience, and the dictates of fine moral feelings. A man who is destitute of fine moral feelings may acquire great knowledge, but how can he learn wisdom?

It is the rage of the present day to teach science to the people—that is, to give them a knowledge of astronomy, geology, chemistry, and political economy. It is well that they should know these things, but let them not exaggerate the amount of happiness to be derived from them.

The knowledge of astronomy will not produce any amelioration of a man's condition. It will not improve his moral nature, nor quiet the heavings of an agitated mind. It may please a man's vanity to think that he knows more than another man, and this greater knowledge may, perhaps, give him greater power, and in some rare instances may lead to promotion. But this is merely a pecuniary view of the matter, whilst no other moral effect has followed than what would have been produced by a bag of sovereigns. The same may be said of every known science. It is not knowledge but moral feeling which is the immediate cause of virtue and happiness.

Science in the aggregate has ameliorated the condition of mankind. By the aid of astronomy and mathematics we navigate the ocean with safety. By the aid of chemistry we increase the comforts of domestic life, in facilitating and improving the different operations of art. By the aid of medicine we alleviate the sufferings of our nature. But it does not follow that the moral character or physical condition of any individual is improved by acquiring a *mere knowledge* of these subjects. Science is a trade. Men live by mathematics, as they live by making stockings, and the stocking-weaver and the mathematician would both prove a benefit to each other, though each were utterly ignorant of the other's employment. They might meet together in this ignorance at the social board, and be happy; but could they be happy without fine moral feelings? No! If one were possessed of bad feelings, both would be miserable. But which of the two would have the best moral feelings—the scientific mathematician or the unscientific stocking-maker? You cannot tell! from which it is evident that science is of no *moral* use to any man individually.

But if science is of no moral use to the individual, what would be the use of teaching science publicly to the nation? what would be the use of substituting scientific lectures for sermons on Sunday? Would they improve the feelings of the people? Not a whit. Science is merely a task for the intellect. The intellect is not the chief seat of pleasure, it is a sort of envelop which surrounds the moral sense, through which language and ideas must pass to affect and electrify the latter; but if the intellect only is addressed, and the living source of pleasure and pain is forgotten, vain, vain are your public instructions, empty are your halls of science, scattered is the flock which you foolishly thought to have gathered.

You may repeat a fine moral sentiment a hundred times, and still give pleasure. There is a sort of music in it which delights the soul; it is like a national air, it fires the imagination. It produces pleasure, not by conveying knowledge, but by an inward excitement, which animates our own natures. It is not so with science. After the curiosity is gratified by the knowledge of a fact, the power of the fact to please or excite is lost; it is dry prose; there is no music in it; it cannot bear frequent repetition.

Let us fancy for a minute or two such a congregation of the faithful, as some of our material philosophers would rejoice to collect into a millennial church. Scientific lectures, of course. A little balm also will be necessary for the afflicted, for even the Owenites do not expect to triumph over death so easily as they have triumphed over hell. There is also a weariness, an ennui occasioned by the monotony and *mechanism* of life, of which the finest feelings are most susceptible; and if these evils are created by the mind, they are so much the more real, inasmuch as they defy the drugs of the apothecary, and the science of the material physician. How are these enemies to be scientifically attacked? Astronomy won't do. It is of no use to talk to an unhappy wretch of the magnitude and number of the stars, or the rapidity and regularity of the planetary movements. The sick stomach nauseates food. Botany, geology, chemistry, phrenology, hydrostatics, pneumatics, entomology, would be equally useless. But suppose the priest of materialism were to lecture on the *properties of matter*, surely, then, he would produce some effect. Show the people that a living man was merely a congregation of atoms, just as an old cheese is a congregation of mites—that the soul was nothing but one of those mites which had got the better of the rest, and kept them all in their proper place by the law of chemical affinity—that at death the congregation is dismissed, and the mites all separate; or prove

to them that organization is the soul, and, consequently, there is no soul at all—that when their friends die, they are for ever lost, and that hope which extends beyond the confines of this life, is a miserable delusion. Suppose he comforts the afflicted and the dying with these words, and extinguishes the finest poetry of the mind, by subduing every feeling which tends to exalt humanity and extend the sphere of its hopes beyond the present life, and the miserable planet in which it is imprisoned. What a scientific effect it would produce!

And suppose, just for the sake of a contrast, that in the same neighbourhood another church is erected, in which the system of instruction is entirely different, in which science is not formally taught, but only occasionally employed to illustrate and impress great moral lessons and poetical sentiments. Suppose the utmost liberality of feeling is inculcated, and the Creator is represented as the affectionate parent of all, having varied infinitely their natures, opinions, and pursuits, and placed them in a world of suffering, merely to give them a short experience of the nature of evil—but that in the end His wisdom and His goodness would be justified to our full satisfaction in the redemption of all—that death is merely a transition from pain to pleasure, from limited enjoyment to fulness of joy—that friends are not eternally separated by the King of Terrors—that the Prince of Life is superior in power to the Prince of Death, and that “though sorrow should reign for a while, joy cometh in the morning!” What an *unscientific* effect this would produce!

Yet this latter church would continue for ever to be better filled than the former. Why? Because there is more *wisdom* in it. Its cordials are richer; it goes beyond the intellect; it searches the very reins; it establishes itself in the heart.

Ah! but suppose the scientific system were to employ dancing and music, and other innocent and social amusements to allure the people, and enchain their affections! Aye! Suppose they were! and suppose the other congregation were to do the same, what then?

Oh! but the scientific system would attract to itself all the talent and worth of the country! It would! Why has it never done so? Is it not because science, like any other trade, will go where the largest and best market is, and the merely scientific system of popular instruction is unable to rise very high in the scale of number and magnitude?

But so far from agreeing with the opinion, that this scientific system would attract more talent, we affirm that the noblest talent, the finest moral feelings, the most elevated sentiments, would be cultivated by the other, for, in addition to all the mere *prose* knowledge which science conveys, it would communicate the poetic elevation of mind which can alone be produced by a religious feeling, when it has been divested of the bigotry of intolerance, and the slavish fear of an angry God and His fiery furnace.

Science will never supersede religion in Sunday popular instruction. Science is too limited in its sphere of thought; it addresses the intellect only. But it ought to be a *sociated* with religion. It is a sieve through which nothing will pass but that which is in harmony with Nature's laws, and though it cannot supply the place of religion, nor satisfy the religious feeling, it is well calculated to put false religion to the test, and bring to light the hidden mysteries of Providence. Religion must come through this sieve.

But it is not the vulgar smattering of philosophy that can produce this happy result. There is as much ignorance of science amongst the liberals as of religion amongst the church-goers. One man reads two or three of the first chapters of Mirabeau, on matter and motion, and he sets up as a philosopher. He begins business, like a pedlar, with a quarter of a hundred of quills, a quire of Bath-post, and a pound of tea, and he calls himself a merchant. He gives his opinion of the British policy with regard to the Russian and Turkish trade—the effect of the opening of the tea trade upon the commerce of this country, and of the suppression of the unstamped on the consumption of paper. Another learns the number and names of the phrenological faculties. He gets a *cast* for half-a-crown, and hears a phrenological lecture. He is now quite primed and loaded; he talks of science, organization, and the properties of matter. It

is all clear as day-light, he wonders at his former ignorance; and now his eyes are opened to perceive that religious people are either knaves or fools, for how is it possible that they can be blinded by any thing but self-interest to the important facts which he knows? He is now a man of science, but for all that he would be puzzled to work the rule of three, or a simple equation: he does not even know a right from an acute angle. He does not even understand how a man can measure the distance of the moon without going there. But he believes it, because it is *science*. Yet the men who cultivate and teach this science are fools, because they do not see his philosophy of matter and motion. This man laughs at those who believe what they do not understand, yet he himself does the same. He believes in mysteries and ridicules mystics. He cannot admit the idea of a directing Providence and Omnipresent Spirit of Nature, but he is marvellously in love with the idea of matter making men and women, and all other animals, male and female, after their kind, without knowing what it is doing.

This is what we call a hallucination, a sort of scientific superstition, a delusion of a man who has been disgusted with vulgar religions, and not considering that in the progress of society, false religions, like false sciences, necessarily precede the true, tired of the search, he takes the royal road to knowledge at once, and contents himself with that most luminous of all creeds, “Chemical Action.”

A well known Atheist in London (we do not mean Mr. Carlile) being asked at a scientific lecture which he delivered, how animal and vegetable organization could be produced, without a creating mind to govern the universe, replied in our hearing, “By a fortunate combination of circumstances!” Another once replied to the same question, “by an *effort* of nature,” i. e. by an effort of an unconscious power. Another replied, that he thought the doctrine of “chemical affinity” could account for it all! These three individuals were clever men, men of considerable information, but yet men who thoroughly despised the religious world for their irrationality, and descended most triumphantly on the *demonstrations* of Science! If fanaticism has made a tragedy of religion, materialism has made a farce of philosophy.

A very ludicrous doctrine is believed by some modern materialists respecting creation. They imagine that Nature, whom some of them regard as half alive or in a dozing state, between sleeping and waking, was at a *loss* how to accomplish creation at first. She could not make man at once; she had not got the idea of such a perfect mechanism, and moreover, it was beyond her power to execute if she had, therefore she began with cockles, snails, and small vermin, to lay a foundation, and in process of time she got up to the larger animals. But in going upwards she evidently made a mistake, and got tired of her work when she came to the elephant, she then retreated, took hold of the simian or monkey race, polished it up, and brought forth man the king of beasts. This very argument was personally used in reply to us by a professor of anatomy. He was not an Atheist altogether. His Nature was a sleepy, drowsy, careless, indifferent sort of nondescript, that wrought by a sort of necessity which was its master. He said that the type of man was seen in all the inferior animals, that the resemblance of the *five* fingers and *five* toes were even to be found in the hoofs of horses and cattle, from which he concluded that nature had been fumbling and blundering away at this number five, until at last she got a set of fingers and toes to please her! This gentleman is an endowed professor of anatomy, and a man well known and respected in the scientific world! We know another very talented gentleman in London who holds a similar opinion. But we can scarcely tell whether he is an Atheist or not. We think his God is more like a somnambulist than any thing else. As for the common class of Infidels, they are as infinitely diversified as the Christian sects. And yet they seem all to agree in this, that science can satisfy every rational mind.

For heaven's sake let us have a little common sense along with it. Common sense, without science, will be more socially and morally useful than science without common sense. The poor peasant who herds sheep and black cattle on the sides of Snowdon, who rides on a merlin without saddle or bridle, stirrup or halter, and does not know B from a bull's foot, will reason more logically, more rationally, and more conclusively on many

important questions of natural religion, than even an endowed professor of science. There is a wisdom even in ignorance, in barbarism, in savagism, which God has preserved in being to put philosophy to shame.

MISCELLANEA CURIOSA.

Account of a man who submitted to be buried alive for a month, at Jaisulmer, in the East Indies; and who was dug out alive at the expiration of that period. Abridged from the Indian Journal of Medical and Physical Science. (Ca cutta, 1836.)

Dame Nature is continually gratifying our appetite for the strange and wonderful; manifesting her unbounded capabilities, and displaying her freaks and fancies in the most unaccountable ways, puzzling alike to the learned and unlearned. Thus she entices man to study her laws more intensely, to unlock her hidden secrets, and, ultimately, to confess that *non est* under the direction of ONE to whom nothing is impossible. For this end she is continually working miracles; not those only which her ordinary phenomena present to our senses every day, but in occurrences and productions so completely at variance with all the systems under which philosophers have arranged her laws, that man is compelled to confess how little he yet knows of her mysteries. A week or two ago we were astounded, in this country, with the discovery that she could produce living insects from pulverised flints; and now we are even more wonder-struck, at learning that in India, that land of wonders, she has brought forth a man capable of sustaining life for a month, although bricked up in a tomb for the whole of that time! This miracle is described in the Indian Journal, by a Lieut. A. H. Boileau, an Engineer in the Hon. East India Company's Service; and his testimony is corroborated by Captain Trevelyan, of the Bombay Engineers, and of Lieut. Macnaghten, of the 5th regiment of Light Cavalry.

It appears that this singular being, who allows himself to be buried alive for weeks or months, by any person who will pay him handsomely, is a young man about thirty years of age, born near Karnaul. By long practice he has acquired the art of holding his breath, and stopping the interior opening of the nostrils with his tongue. He abstains from solid food for some days previous to his interment, so that he may not be inconvenienced by the contents of his stomach while pent up in his narrow grave. The place in which he was buried at Jaisulmer, is a small building, twelve feet by eight, built of stone, and in the floor was a hole about three feet long, two and a half wide, and the same in depth, in which he was placed in a sitting posture, sewn up in a bag of cloth, so that the white ants and other insects might not easily molest him. His feet were turned inwards towards the stomach, and his hands pointed inwards towards the chest. Two heavy slabs of stone were placed over him; the door of the house was then built up, and guards were placed outside to prevent collusion or deception. At the expiration of a full month, the walling up of the door was broken, and the buried man was dug out of his grave. He was found in a perfectly senseless state, his eyes closed, his hands cramped and powerless, his stomach shrunk very much, and his teeth jammed so fast together that, before a little water could be poured down his throat, his mouth was obliged to be forced open with an iron instrument. He gradually recovered his senses, and, though presenting an appearance of extreme emaciation, his spirit was good, and his confidence in his powers unabated. In proof of this, he told Lieut. Boileau and Captain Trevelyan that they might bury him again for a twelve-month if they pleased! It is said that he has undergone the process of burial and disinterment six or seven times. In one instance, at Pokhur, he was suspended for thirteen days in a wooden chest, hung from the ceiling, which he says is the best method of putting his powers to the test, as the box is open to inspection on all sides, and the white ants, &c., can be better excluded from getting at his body while he remains in a state of insensibility. Lieut. Boileau says that he fully believes that the man is no impostor, but that he really possesses the powers described. For seven or eight days preceding

the burial at Jaisulmer, the man lived entirely upon milk, regulating the quantity so as to sustain life, whilst nothing remained to give employment to the excretory organs. Lieut. Boileau understood that the man soon regained his strength: and that, being disappointed in not receiving the promised reward from his patron, he had stolen a camel and decamped. This generous patron was one of the ministers of the Muharawal of Jaisulmer, who certainly deserved a similar inhumation by way of teaching him humanity. Our newspapers have recently teemed with deprecations of the enormity of one of our theatrical managers pandering to a vitiated taste by hiring a female to risk her life by ascending an inclined rope in one of our playhouses. What would they say to the spectacle of burying a man alive!

The editor of the Journal quoted remarks, that until further information be obtained, it might be precipitate to theorize on the probable means by which this extraordinary creature maintains the mastery over the functions of life. He states that it is now well known that the slaves in South America exert the power of forcing the tongue into the pharynx, and retaining it there to obstruct respiration and occasion death, when desirous of committing suicide.

As in some way relevant to the preceding subject, we insert a few notes from Dr. Willich's Encyclopedia, Art. Amphibia. Dr. W. observes, that inquisitive physiologists have advanced the idea that man may by art be rendered amphibious, and thereby be enabled to live under water as well as the beaver or turtle; because the fetus *in utero* lives without air, and the circulation is continued by means of the oval hole (*foramen ovale*) if, therefore, this important opening could be preserved after the birth of the child, the same useful faculty might still remain. He considers that by gradually accustoming young children, soon after their birth, to suspend their breath once, or oftener, in a day, increasing the duration of the experiment with every attempt, the blood might at length be directed to circulate through its original passage; which, by several trials, cautiously repeated, would no doubt remain sufficiently lubricated, and never again be closed in the ordinary manner in which we find it.

This is an ingenious speculation: but we are fearful the poor child undergoing such a *gradual accustomment* as the Doctor speaks of, would be even in greater hazard of its life, than those infants are whose parents subject them to a cruel dislocation of all their limbs, for the express purpose of making dwarfs and monsters of them for exhibition, for the sake of gain, a practice which is said to be by no means rare, especially in Italy.

A few days ago we read an account of a somewhat similar case of torpidity in puppies. It was extracted from the *Tyne Mercury*. The puppies had been immersed half an hour in water, and then buried in a dung hill, they were all alive 22 hours after. But Dr. Franklin's fly is much more marvellous still. It had been soaked for twenty years in a pipe of wine, and on being exposed to the rays of the sun, it flapped its wings and flew away without even evincing the symptoms of intoxication. Two years ago *The Omnibus*, a Neapolitan paper, contained an account of a Diver in Naples, called Lorenzo Giordano, a native of Piumara, in Calabria, who is able to remain six hours under the water in the deepest places, and to walk at the bottom at the rate of a mile an hour. Mother Nature is always playing some prank to make philosophers stare vacantly at each other, more especially those sages who are so very dictatorial in telling the world what is, and what is not contrary to Nature. If Mr. Hume's philosophy be correct, if it be more probable that the witnesses are mistaken in their testimony, than that the fact is true, i. e., if it be more probable that other men are liars, than that Mr. Hume's experience is fallacious, then there is no truth in the report, and you may have an opportunity of looking tolerably wise by merely curling the lip, making a contemptuous sneer, giving a sagacious shake of the head, and thus disposing of the matter. Many people get credit for wisdom and shrewdness by this trick. As we are not ultra liberals, however, we shall say a little more upon the subject. What we mean to say, however, is a digression.

What becomes of the man himself all this while? Is he con-

scious or unconscious? Does he dream or not? There's the rub!

In the last number of the *Monthly Review* there is contained a review of a book by Dr. Bendel, giving an account of a natural somnambulist, who often remained in a fit, twenty, thirty, and even forty hours, and went through all her domestic duties, read and sang, and saw in the dark, and yet was fast asleep, and when she awoke, had no consciousness or remembrance of what she had done; she even learned to play at backgammon in her sleep, beat a most experienced player, and knew nothing of the game when awake. There is a similar account of another by Dr. Dyce, in the *Transactions of the Royal Medical Society of Edinburgh*, Vol. 9., and there is a case recorded of a girl in Stirling, who in this state talked like a philosopher, explained the movements of the heavenly bodies, in language and with a felicity of illustration of which she was incapable when awake.

We might adduce a hundred different cases of merely natural somnambulists, who all present this one invariable peculiarity—viz., that when they awake, they are utterly unconscious of what they have done in sleep. They are therefore called by medical men "cases of double consciousness." They seem to have two natures, when asleep they remember all they have said and done on former occasions in sleep, but when they are awake they remember nothing they have said or done in sleep.

Now here is proof positive that the whole world of experience and medical science confesses to be literally correct; that the mind may be busily engaged in thought, word, and deed for any given space of time, then suddenly lose every vestige of remembrance of its sayings and doings, when its every day sensibility returns. May not this have been the case with the Hindoo? His own evidence is of no use. Jane Rider, Dr. Bendel's patient, wrote a letter to her mother when she was asleep, yet in 24 hours after she might have taken her oath conscientiously that she had not written the letter. It is very possible that this miserable shrivelled Hindoo whilst bodily he was sitting coiled up in a hole and tied in a sack, was mentally revelling in fairy fields of vision, where neither the fear of white ants, nor the want of money beclouded the sunshine of the vivid enchantment. When they dug him up and rubbed his stomach, and forced his jaws open, and poured some of the life of this world into his throat, the enchantment ceased, and the memory vanished along with it.

VESTED RIGHTS.

The late Archbishop of Canterbury's distribution of patronage:—

His son-in-law, Dr. Percy, Finsbury prebend, 1,513*l.* per annum; Chancellorship of Salisbury, 84*l.* per annum; and fines from 1811 to 1834, 30,000*l.* (Bishopshorne, R. 1,240*l.*; resigned when appointed Bishop of Carlisle, 2,585*l.*); held by vested interests.

His nephew, T. Manners Sutton, Great Chart R. 668*l.*; Tunstall, R. 479*l.*; which he holds with the subdeanery of Lincoln, 1,840*l.* per annum; in all, 2,987*l.*; all held by vested interests.

"It is a very fine thing to be son-in-law
To a very magnificent," &c.—SHIELD.

R. Croft, son-in-law, Archdeaconry of Canterbury and Prebend, 900*l.*; Cluffe at Hoo, R., 1,297*l.*; Saltwood, R., 784*l.* Total, 2,981*l.* All of which are held by vested interests.

Bishop of Ely, eldest son, Chancellor and Prebend of Ely, 800*l.*; Liverington R., 2,099*l.*; Gunthorpe R., 534*l.*; Littlebury (sinecure), 24*l.* Total, 3,457*l.* (besides fines 5,000*l.*) All of which are held by vested interests.

His youngest son, Prebend and Registrar of Diocese, 700*l.*; Feltwel, R., 1,207*l.*; Littleput V. 1,487*l.* Total, 2,764*l.* All held by vested interests.

His son-in-law (Fardel), Prebendary of Ely, 650*l.*; Wisbeach, 1,779*l.*; Waldbeach, 474*l.* Total, 2,903*l.*

"Who would (not) Fardels bear?"—SHAKSPEARE.

"Godliness is great gain."

A PUZZLE.

SOME time ago, and somewhere, we do not know when, and we know not where, we read of a sudden judgment inflicted on a man who was cursing, swearing, and profaning the name of God. Whilst the blasphemy was warm upon his tongue, and his hearers were only wondering what new conceit of impiety would come next, he fell lifeless on the earth. Whether this was a fact or not, we know not, and it matters not for the moral which we distill from it. A few days ago a Coroner's Inquest was held on a woman who died suddenly in Leicester-square, when in the act of saying her evening prayer, before going to bed, according to her usual custom.

These two cases are curiously antithetical. We remember well the religious comments on the former. It was an awful judgment, a clear case of Divine vengeance on a hardened sinner! But what will you make of the latter?—a judgment too? "No, indeed!" says the pious Puritan, "it was merely an invitation to the devotional spirit to partake of a more perfect intercourse with the God whom it addressed."

But the reasoning of the Puritan may easily be inverted without doing violence to any of the rules of logic. We may suppose the Deity in the former case to say, "This fellow is very much dissatisfied with my providence in this life; he really despises my name and character; I shall take him to a world where he shall see me in fairer colours," and in the latter, "This woman is everlastingly praying to be redeemed from her own evil heart. There is no way of getting rid of her heart but by death—I shall cut the thread of life, and let her out!"—(snap). These two reasons are quite as good as those quack inventions of priestly manufacture which shake the nerves of the timorous. Swearing and cursing are abominable vices, and only practised by the lowest in moral and intellectual rank, but they have really produced a mere trifle of evil in comparison of that vulgar and delusive vice of formal prayer, by the patronage and encouragement of which priestcraft thrives, bigotry is nourished, and religious melancholy and madness disseminated over the country.

SOMEWHAT HORRIBLE.

The reverend author of a little work called *Medicina Clerica*, in a note upon the treatment of the dying, says, "In an instance known to the author, a gentleman was supposed to be dead, when he was only in a trance, but unable to move or speak, and it was only by a violent effort occasioned by the horror which he experienced when the persons were preparing to put him into his coffin, that he was able to make his case known, and to recover." In this case there must have been all the symptoms of death,—viz., cold, cessation of respiration and pulsation, and consequently of circulation, and yet this apparent death co-existed with a state of consciousness. Evidently the amount of life, or conscious being, cannot be determined by the power of the will over the members of the body.

FERNEY.

FERNEY, the final residence of Voltaire, and hitherto a species of shrine for literary pilgrimage and idle curiosity, has been sold by auction. The new proprietor is about to convert it into a beet-root-sugar manufactory. The little chapel which the infidel philosopher erected to the Deity, and which bore the inscription "Deo erexit Voltaire," is to be turned into a stable or a cow-house. Had the estate been converted into a wholesale slaughter-house, the interpreters of prophecy might have made something of it, but what will they say to a sugar manufactory? "Out of the eater came forth meat, and out of the strong sweetness;" and what will they say to the cow-house? "Is the milk of the word to flow from the temple of Deism and Infidelity?" But what will they say to the stable? Why! Christ himself, the God of this world, to whom all power is given, was born in a stable. A stable was the first Christian church. After all, we can see no Divine judgment or retribution in it—but the Dissenters will.

OLD GRANDMAMMA ;

OR, OUR VENERABLE ESTABLISHMENT.

In the month of October last the Bishop of Exeter, in his visitation charge, made an acknowledgment, such as very rarely indeed escapes the lips of a high-church partizan. "It is notorious," he said, "that two-thirds of the lay patrons, who, at the present day, hold the greatest portion of church livings, design their sons or near relatives for their own benefices, and they are sent to college and educated expressly for the purpose."—This is an episcopal confession, and, evidently, not a *voluntary* one. It is extorted by the rack of public agitation, and by the increase of public intelligence, which, in these days, by means of official investigations, bring all the secrets of political and ecclesiastical authorities to light. There are about 10,708 benefices in the Church of England (in the last returns), the patronage of which is distributed as follows:—The crown has the presentation of 952; the archbishops and bishops, 1,248; deans and chapters, &c., 787; dignitaries and ecclesiastical corporations, 1,851; universities, &c., 721; private owners, 5,096; municipal corporations, 53. According to the 139th clause of the Municipal Corporations' Act, this latter number must be sold, it not being considered consistent with English orthodoxy that a corporation of citizens, elected by the people, should possess the right of nominating a clergyman. The 53 will, therefore, most probably be bought up by the lay patrons, thus swelling the list of lay benefices to 5,149. But the *crown*, and its ministers and parasites, are also *lay* patrons, for, although the king be proclaimed, by Act of Parliament, "head of the church," he is merely an honorary clergyman, and his council, who exercise the right of royal advowson, do it in the same spirit, and for the same domestic purposes, as if the right was hereditary in their own persons. The patronage of the Bishops is not more pure and disinterested than that of the laymen; and that of the universities is well known to be of a peculiarly party character, which looks chiefly to the preservation of the tithes and offerings, according to ancient usages. The whole church, therefore, is under the patronage of pure selfishness. The people have not the slightest share in the administration of her affairs, except the solitary, honorary distinction of granting or refusing the levy of a church-rate! The church is merely a nest for the aristocracy, guarded by superstitution, and the mask of sanctity with which the clergy have contrived to cover its moral deformities. It is for this reason solely that the rich and the great of this world are now ranged on her side, whilst the poor, to whom the gospel was especially sent, to give them "the oil of joy for mourning, and the garments of praise for the spirit of heaviness," are, with very few exceptions, her declared and determined foes. After eighteen hundred years' experience, it is really yet a matter of doubt whether Christianity has been of any service to the poor man! They who profess to be the teachers of truth, and patterns of morality, who are called the heralds of salvation, the ministers of the sanctuary, the followers and the representatives of the meek and lowly and condescending Jesus, are now, alas! nothing but the sons and nephews, the élèves and tutors of a proud aristocracy, who, along with the rights of political legislation, have also usurped the direction and control of the metaphysical opinions of the mass of the population. But political Christianity is no more like true Christianity than the Ptolemaic system is like true astronomy. It is merely a corrupt piece of craft, the offspring of successive ages of political and ecclesiastical intrigues having a specious appearance of conformity with the Christian doctrine, but unable to abide the test. True religion is that of the heart, whose virtues are not esteemed by the rich and the learned, and the men of property and interest alone, but commend themselves to the admiration of all classes, and especially the poor. Nothing has a greater tendency to make religion contemptible than to make a trade of it. Virtue itself would lose its character, if a set of men were paid from public imposts for its exhibition. These words alone, "that fellow is paid for it," would be sufficient to throw suspicion on all his conduct. It is only when it is spontaneous, the pure emanation of the soul, without any perceptible interested mo-

tives of a pecuniary nature, that Virtue appears in its universal character, and commands the respect and adoration of every religious sect. There is nothing we respect in the great Apostle of the Gentiles more than his noble ambition of preserving this disinterestedness of character. He refused contributions, and supported himself by his own labour. He levied no *rent*, he exacted no *tithes*, he begged no *offering*; but he made tents for his own support, and under the name, character, and dress of an *artisan*, a working man, he revolutionized the world. There never was a greater man than Paul; and yet how humble and independent! The first Christians raised the church by humility; their followers substituted pride and vain glory; and these will bring the Jezebel they have enthroned to an ignominious end. Revolution, under every name, shape and character, will multiply around her, and pick her very bones. The skeleton will be seen in due time.

CONVERSION OF BUCKHARDT, THE TRAVELLER,
TO THE MAHOMETAN FAITH.

WHEN I contemplate the monstrous absurdities believed by Christian sects, Methodists, Calvinists, Ranters, Jumpers, &c., I am not much surprised that our priests should have trembled for their hierarchy, their tithes, &c., at the more rational system of Mahomet, and have had recourse to the falsities and misrepresentations, which I have exposed, to keep it from being fairly seen by their followers. My surprise is still less excited when I find in the nineteenth century a talented and learned man going over to the Mahometan faith. The celebrated traveller, Buckhardt, who was educated at the University of Cambridge, after the most careful inquiry and mature deliberation, turned Mahometan, and, amidst the circle of his Christian friends, died one. It appears that he was instructed in the Mahometan faith, and converted to it by a learned offendi at Aleppo, and that he there publicly professed it, and underwent a close examination into his faith, and his knowledge of the Mahometan tenets near Mecca, when he performed his pilgrimage to that place, in consequence of which he ever after claimed the title of Hadji. His conversion seems to have been sincere, though generally, I think, concealed from his Christian friends.

I have the pleasure to be acquainted with a gentleman who now (May, 1829) holds a respectable situation under the British Government—but whose name I have not authority to give—who told me he was present with Buckhardt, a very little time before he died, when he was gravely assured by him that he was really a Mahometan, and would die one. His anonymous biographer, in his posthumous work, gives an account of his death, but carefully avoids saying a word on the subject of his religion. He probably knew that if the truth came out, the sale of his book would be ruined by the calumnies of the priests. But one sentence escapes, which is sufficient to confirm what I have said: "He died at a quarter before twelve the same night without a groan. *The funeral, as he desired, was Mahometan*, conducted with all proper regard to the respectable rank which he held in the eyes of the natives."

He seems to have had no interest to prejudice him in favour of Mahometism, but, on the contrary, he thought it necessary to conceal it from his Christian employers, from whom he received his support. Among other amiable traits recorded of this APOSTATE INFIDEL, as he will be called, he reduced himself to absolute and complete poverty, by giving up his patrimonial inheritance (one thousand pounds) for the maintenance of his mother.

The confidence which the Mahometans have always shown in the justice of their own cause, as close examination must convince anyone, is very remarkable. I refer my readers to the case detailed above of the Mogul in India, to the mode in which they have always tolerated the Christian religion, in Greece, and the other countries, which they have conquered, and lastly, to the fact taking place at this time, that the Grand Signior and the Pasha of Egypt have sent great numbers of their young men to be educated in London and Paris, without exhibiting any fear of their principles of religion being shaken. —*Higgin's Life of Mahomet.*

AGRICULTURAL LABOUR—DIVISION OF PROPERTY.

MALTHUS, GODWIN, AND SADLER.

AGRICULTURAL skill and science have been brought into activity by means of large farms. Small farmers have not capital sufficient to effect improvements in the art of agriculture. "Where," asks Mr. Young, "is the little farmer to be found who will cover his whole farm with marl at the rate of 100 or 150 tons per acre?—who will drain all his lands at the expense of two or three pounds an acre?—who will pay a heavy price for the manure of towns, and convey it thirty miles by land carriages?—who will float his meadows at the expense of £5 per acre?—who, to improve the breed of his sheep, will give 1000 guineas for the use of a single ram for a single season?—who will send across the kingdom to distant provinces for new implements, and for men to use them?—who will employ and pay men for residing in provinces where practices are found, which they want to introduce into their farms? At the very mention of such exertions, common in England, what mind can be so perversely formed as to imagine for a single moment that such things are to be effected by little farmers? Deduct from Agriculture all the practices which have made it flourishing in this island, and you have precisely the management of small farms."

This is all true enough, but it is also true, and a melancholy truth it is at present, whatever it may turn out to be in future, that this flourishing of Agriculture has gone hand in hand with the diminution of the labourers wages.—(*Davies' Tables.*)

But why should it be so? Why should a workman's wage be one half less valuable now, than in the 14th century, when the soil is bringing forth food for at least four times the number of inhabitants? The man's labour is still necessary, the improvements do not altogether supersede it, and whenever it is required, it is natural to suppose that it should be paid as formerly. There must either be more competition, more labourers in the field, or the masters must be defrauding their servants, by withholding the wages of labour.

There are more labourers in the field, and considering that improvements and machinery are substitutes for human labour, there are more than seem to be. The machine that does the labour of six men is equal to six additional labourers. The wages are divided amongst men and machine, and the machine-makers become an additional portion of the agricultural labourers, with better wages. If the land, by this additional labour, yield fourfold its former produce, it has fourfold its former amount of inhabitants, and the distribution of food, by means of large towns and cities has undergone a change which puts an unequally large share in the hands of the townspeople, citizens, and fee-lo-sophers.

Large cities are supported by the agriculturist, and the larger the city, the greater the burden. In a country without cities, most men are agriculturists. When cities are formed, the fine arts arise into being. When thousands of painters, sculptors, actors, fiddlers, authors, printers, booksellers, carvers and gilders, toy-makers, coachmakers, and innumerable other trades arise into being, it is an addition to the family of the farmer, who has to provide for them all.

Being nearest the seat of power, where all the wealth of the country is concentrated, and from which it pours forth again like the blood from the heart, the inhabitants of cities and towns have the fullest and quickest supply of money. The circulation of money is exactly like that of the blood—it is quickest and strongest in the large vessels, and nearest the heart. When the body of a child increases in size, the extremities of the blood vessels do not increase in thickness, they elongate and shoot out their infinitely small branches to the skin, but the heart and large veins and arteries become larger and stronger. You might imagine a child to grow as large as the Peak of Teneriffe, his heart as large as Gibraltar rock, and his jugular vein as large as the Thames at Greenwich, still the extremities of the veins at the skin would be invisibly small, and would require the aid of the microscope to examine them. Thus it is with society at present, whatever may be the case hereafter. Cities increase, and wealth increases, and money or blood increases, but still the labourer at the circumference is as poor as ever, and it would

require the aid of a microscope to discover the wealth he possesses.

The tendency of progress is to push mere bodily labour out of existence as much as possible. It will not diminish drudgery by so doing, for there is as much drudgery in skill work as in muscular work, but machinery is supplying the place of muscle, and calling into more general action the latent skill of human nature. You may contrive to pay muscle a little better than it is now paid, but still it is doomed to be superseded and hunted out of its old animal employment.

The introduction of small farms would restore this animal employment, and reduce the size of cities and towns, by employing more muscle, and less skill and science and art. This would diminish the amount of mind and of power, and consequently of wealth in society.

When pushed upon this question, many of our modern cottage-system-ers are apt to launch out into praises of savage life and old rustic times. They paint imaginary pictures of pastoral, rural, and spade-digging felicity, and either believe them themselves, or wish to impose them on the faith of others. But such visions are merely prose run mad. The small property system is the curse of society, whether in farming or manufacturing. Small masters, and limited means of carrying out into practice the discoveries and suggestions of genius and science, are the most formidable obstacles to advancement and improvement. We believe it will be found upon an average that the labourers of rich are more bountifully supplied than the labourers of poor farmers. It is so with the factories. Every working man instinctively acknowledges this truth, by giving the preference to the service of a rich house, and an extensive business. Even the very horses will unite their testimony to the men's, deposing that they are better fed by the large, than by the small proprietor.

But how are we to get rid of small proprietors? not by small farms and small factories, and small establishments, and poor masters certainly. The larger the farms, the larger the factories, the larger the establishments, the richer the masters, the better for the workmen. There are too many masters. The people want economy, there is no economy like ONE master. But as this is perhaps too Utopian a proposal, we may infer that it is better to reduce the number of independent masters than to increase them.

When we say that the farms are too small, we make no allusion to noblemen's and gentlemen's estates, which are not farms, but patrimonies divided into farms. Were the Duke of Bedford a farmer, the labourers employed on his land would be better paid and better fed than they now are. The Duke would then be responsible for their support—at present he is not. The farmer takes a farm, and employs the labourer, so that the latter, by this transfer of proprietorship, loses all the benefit of the large estate. Were the Duke an enthusiastic farmer, he could employ skill and science with considerable effect; but the tenant, in spite of his genius, is debarred, by slender means, from effecting the improvements which he sees possible. There are very few large farms after all. The average, according to Dr. Beeke, are rented at 150*l* per annum—scarcely sufficient to keep a farm-yard in repair, and the watchdog in bones. But it is only on such large farms as those of Coke, and other gentlemen farmers, that agriculture can be scientifically practised. In the greater proportion of farms, the land is robbed and enslaved. We would rather see the land divided into large estates, among such men as Coke, of Norfolk, than parted into small allotments, as proposed by many. There is no end of partition with an increasing population.

But it is impossible to invent any practicable system of permanent amelioration, until the subject of population be advanced to a science. It would be easy to provide for all the inhabitants of the empire, and to feed and clothe them well, if it were not certain that this good treatment would immediately increase the number to be provided for. Could the people be taught to preserve a stationary amount of number, by making the births and deaths to correspond, universal happiness might be the result—and not a hungry stomach be found in the country. But false religion and false morals and false delicacy conspire to prevent this happy consummation. It is the Devil's own world, and the pure in heart are determined to keep it so. In the

genuine spirit of this purity, Malthusian Whigs have adopted the penal check, preferring the discipline of force to that of instruction. But they *must* fail; every system must fail which is not established in the *hearts* of the people. Even the Whig Malthusian check, however, will produce some good results to the next generation, but much better results might easily be procured by more moral and more voluntary means.

It is not enough that a country produce sufficient to support its inhabitants. It should always have a large surplus on hand. This has never been the case in our land, even with a half-fed population. Food for man might be made as common and abundant as food for sparrows; but even this abundance would be a dangerous thing with a rude, uneducated, unprincipled people. The people must be ignorant, base, and unprincipled, as long as the present system of theology retains hold of their minds. Poverty goes hand in hand with it. Legislation will never affect the extremities of society, as long as the pulpit continues to poison the morals of the people; and, whilst poverty ravages at the suburbs, there will always be the fear of poverty within the walls. The civilized world is now, for the first time, settling down into a state of permanent peace and productive industry. The ravages of war, of famine, and pestilence are at an end. Population is, therefore, increasing most rapidly; but it would increase with much greater rapidity were it not for the vast number of individuals who are deterred from marriage by motives of prudence. This creates an evil well known in society, which Malthus calls one of the checks of vice and misery ordained by God. Sadler calls this impiety and blasphemy, and gives another cause to it. Both acknowledge the fact. On the other hand, poor people marry and multiply exceedingly. All the increase comes from the poor; they rear their children without education, without trade, without moral instruction, or example, *because* they have not the means of educating, apprenticing, or moralizing. These are two opposite evils. Were the first evil removed, population would increase; were the second evil removed, after the radical system, population would increase; and were it removed after the Malthusian system, the unmarried evil would increase. Were population to double itself, as it is calculated it would do in a healthy state of society, in twenty-five years, we should have 130 millions in Britain in 75 years, and in 100 years, 260 millions. But Sadler and Godwin say there is a principle in Nature which checks population spontaneously. True, there is; but that very fact shows that excess is an evil. There is a principle in Nature which will cure a surfeit, but it never acts till pain is experienced. There is a principle in Nature to cure a sore, but it is better to assist Nature with a salve. Nature is our model; we ought to imitate her. If we merely suffer her to act for us, we shall be smartly punished; but, if we *work with her*, she will reward us for our labour. The subject of population, therefore, we say, ought not to be left to Nature any more than the subject of agriculture. Malthus, though a priest, was a better philosopher than either such mawkish Christians as Sadler, or such liberal Utilitarians as Godwin. Yet Malthus only taught celibacy as the cure, which is ultimately as bad as the disease. Celibacy, &c. leads to prostitution. Sadler, Godwin, and vulgarism lead to an excess which must be cured ultimately by emigration or banishment, and a revulsion of Nature.

Such systems are too natural. Nature is a devil to intelligent beings, and the greater the intelligence the more devilish she is. There is great wisdom in this, for it becomes a stimulus to intellectual activity. Were Nature to plough, sow, and reap, the farmer would swill his ale and smoke his pipe. To prevent this, Nature not only refuses to do either, but actually sows and rears weeds of every description to spur him to action. Natural systems are bad systems. Our grain, our fruit, our bread, our ale, are all artificial. Nature makes poor provision for a savage. Why, then, leave any thing to Nature? NATURE IS THE DEVIL.

A radical cure in religion and morals, with a little legislative co-operation, would settle the business; but the one is of no use without the other. Mere legislation is a contemptible delusion.

ON THE UNDERSTANDING.

My first papers (viz. "Idealism," in No. 3, and "On Matter," No. 4), related exclusively to the senses, and the dogmatical assertions made by the materialists to explain their impressions. They both contained the same subject, though it was treated in two different manners. The result of both was the same, namely, that the senses merely manifest different kinds of resistances, and communicate nothing of the exterior cause of our being so resisted.

Let us for a while drop our metaphysics, and turn to our grammars.* Nouns substantive, we shall find, are divided into *common* and *proper names*. A proper name is one that is peculiar to a single individual, as *Socrates*; a common name, one that will serve to denominate several individuals, as *man*, a name that is common to Socrates, Plato, Hermes, the Transcendentalist, and all the readers and writers of the *Shepherd*.

If we look further, we shall find that these common names include nearly all the substantives of a language; in fact, they are the only terms used at all in a moral essay, unless, indeed, some remarkable person is adduced by way of example. Turn to the article *Foi et Avenir*, p. 28, and you will see that it opens "The heart of the friend of mankind," &c. There are three general terms—*heart*, *friend*, and *mankind*.

But our senses afford nothing to correspond with these general terms. They show us Peter Smith or Harry Jones,† but they never exhibit to us "Man" in general. While writing this article, I have before me three images representing Milton, Shakespeare, and Homer, but I only see those *particular* images, and never saw an *image* in general.

We find, then, that the senses give us no impression which is adequate to the wide meaning of these general terms. Well! have they no meaning whatever? Try. Say to the voracious numskull of your acquaintance, "Man is Mortal," and you will find he perfectly knows what you mean, he never dreams that there is anything abstruse in the sentence. Stop a bit! "He knows your meaning." Does he see your meaning with his eyes, does he hear it, smell it, touch it, taste it? No! He UNDERSTANDS your meaning.

Now let us close our Lindley Murray's Grammar, and "wheel about" to our own metaphysics. We find we have a faculty called the *understanding*, which busies itself about more than the mere impressions of the senses, it busies itself with the meaning attached to general terms; and as we cannot call that which corresponds to such a term, a sensation, we will agree to call it a "*conception*."

This word "*conception*" is not one of the happiest in the language. The German word "*Begriff*" is far better, it signifies a grasping. Thus the conception attached to the general term *man*, may be said to grasp or include within itself the meanings attached to such words as *Peter Smith*, &c.

As it is evident we do not receive these conceptions from the senses, let us see how we do get them. We take a walk into the fields, and we see a number of creatures, with lofty necks, long heads, flowing manes, and several other particulars. We compare these creatures together, and find that they have these particulars in common, however they may differ in size, colour, &c. We therefore do not reflect on their differing, but merely their resembling qualities, and call those who possess the latter, by the name *horse*, the *conception* attached to which includes under it a number of individual horses, differing in various particulars. Examining another set of creatures in the same manner, we give them the common name of *oxen*, and further finding that the *horses* and *oxen*, however they may otherwise differ, agree at least in having four feet, we again drop the differing points, and call both *quadrupeds*.

Thus we have acquired three conceptions. One of a set of creatures with flowing manes, &c., another of creatures with horns,

* I hope the more learned readers of the *Shepherd* will not be offended, at my gravely stating what they may think universally known, but I assure them that for many of their fellow readers, it is necessary to begin with as simple truths as possible.

† Even this is to be understood with great qualifications, which however, are too abstruse to state at present.

&c., and a third including these two, of four footed animals, which we denominate by the respective names of *horses, oxen, and quadrupeds*.

Let us reflect a little. Have we been passive in forming these conceptions? Have we been calmly taking in all the impressions the senses have given? No. On the contrary, we have been dropping one sensation, directing our attention to another, utterly regardless of the order in which our senses received them. In short our minds have been entirely active. Here the *understanding*, by which name we here designate the power of forming conceptions, is an active faculty.

The acts we have performed are three—comparison, abstraction, and reflection.

By comparison, I mean the act by which we brought to our mind's view several horses at once, for if while looking at one, we had forgotten the other, how could we have told whether they resembled or differed?

By abstraction, I mean the act by which we removed or "drew off" the differing qualities.†

By reflection, that by which we considered the resembling qualities, after those that differed were abstracted.

All these acts were necessary to the formation of the conception "Horse," and the first of these was comparison.

By comparison, we brought the individual objects together, we brought them to one view, to an *unity*.

And how can I bring objects to an unity? Simply by thinking of them at the same time. In fact, the expression "I think," implies "I bring to an unity." How could I think of a number of individuals at once, without bringing them to one view, and, as it were, making them to one object?

An illustration will render this easier to be understood. A single leaf is *one* leaf; this leaf, with the addition of several others, besides a trunk, branches, &c., is *one* tree. A multitude of trees is *one* wood, and this wood, with the addition of houses, churches, or whatever you please, is *one* prospect.

The inference to be drawn is, that unity is not a conception gathered by abstracting from various particulars, but that it lies at the basis of our conceptions. We cannot form a conception without previously comparing, and that is without bringing several objects to an unity. Hence *unity is an innate conception*.

So far for the present, but I have not near done with the understanding yet. I intend to make my readers first acquainted with the principles of Kant's knocking down system, and then show how subsequent philosophers have constructed out of the materials he has left. This I shall do in a manner hitherto unattempted.

THE TRANSCENDENTALIST.

† I use this word in Kant's sense, not Locke's, whose "abstraction" rather corresponds to our "reflection."

(See Notices to Correspondents.)

POOR.

THE present system of Poor-laws is by no means an original idea of the Whigs. Its chief peculiarities are either copied from or identical with a system proposed by many eminent individuals of ancient times. The following is the substance of three schemes by the celebrated Sir Matthew Hale (chief justice), Sir Josiah Child, and Mr. Cary:—

1st. That the care of the poor ought not to be left to each parish; but that every county should be divided into large districts.

2nd. That in each district proper buildings should be provided for the poor, at the common charge of the district.

3rd. That the poor-rates of every parish, in each district, should be united into one common fund.

4th. That in each district there should be established a corporation with perpetual succession, to whom the whole care of the poor should be committed.

5th. That each corporation should be capable of taking lands and goods for the benefit of the poor.

The author of a pamphlet on the subject of the Poor-laws, in 1751, and a member of the House of Commons, gives the idea of a Whig Poor-law Commission, in the following style:—

"I can think but of one thing now which I think might be

added, that is, that commissions should be yearly issued, under the Great Seal, to persons of the first rank and eminence throughout the kingdom, to visit and inspect all the houses in the several districts, and to report the state of the poor to the next session of Parliament, that so any defect which should be discovered might soon be supplied, or any abuse meet with a speedy reformation. These persons, when in execution of their office, should be distinguished by some honourable ensigns of authority, and during the continuance of their commission, should have precedence of all persons, except the great officers of state, for it is just that they who humble themselves to this good office should be exalted in this world, as they certainly will be in the next."

It appears from this that the writer imagined that the great officers of state would be exalted above all other men in the next world, and that the Poor-law commissioners should rank next in order. We question much if this doctrine will accord with the Radical theology of the present age. The deepest story in hell is more likely to be allotted to the commission by the ultra-Liberals of the 19th century, who seem more inclined to send the poor than the rich to Heaven, as it is rather too hard a lot to be starved to death in this world, and afterwards damned in the next.

TO CORRESPONDENTS.

We must beg the Transcendentalist's pardon, for the blunders we have committed in his two letters; the first, which was no instead of see, we marked three different times in the proof, and the compositors sent it back, saying it was no in the manuscript. We had been accustomed to rely on their judgment in decyphering manuscript, and we let it pass, it not being convenient at the time to refer to the copy. In the last letter some lines were misplaced after we had read a proof. This, we believe, was done in haste, to make room for the note. We soon after discovered this mistake, and it was corrected after a few copies were printed off. T. may have a correct copy by sending for it. "Substratum of all numbers," we confess we read "Subtraction of all numbers," and it was so altered. There is sense in the latter reading, but only an imperfect sense, and we stumbled over it. It is easier to perceive a very gross blunder than a small one. But we shall be more careful in future. Indeed we were hurried last number, because forgetting that we had to see the work go to press, we had engaged to be at home at four, and were obliged to break our engagement to finish our work. What with the motive to stay, and the motive to go, we resembled a Brazilian Savage between a Catholic and a Protestant Missionary, trying to please both he pleases neither, and he therefore two battles to fight instead of one. We were in a similar predicament. The bottom of a saucepan was burnt, keeping our potatoes warm, we had to apologise for that; and now we are apologising for something much worse. We shall see all right this week, and dine at Johnson's on Alanode beef, and a penny roll, rather than repeat the penance we are now performing. There was a blunder in our first article too, in some copies, second page, a few lines from the top, "more ridiculous," instead of "less ridiculous."

Unless it be a controversy of a very particular nature, we are not disposed to admit it into the Shepherd, but "S." may satisfy his appetite for Logomachy, or any other species of theological controversy, by attending the Society at 72, Newman-street, on Sunday evenings. He will be quite as comfortable there as at church, and there are no dead men's bones in the vaults beneath. Neither do they wrestle with the Lord in prayer, but set to work just like a Quaker's meeting, when the spirit is at it.

The "Gallery of Pantheism" in our next.

Those of our readers who are not supplied with copies of the first volume of the Shepherd, or whose sets are imperfect, can be provided with single numbers, or complete copies, through the medium of their respective agents. We printed a considerable quantity for stock, and the demand has never ceased; but since the announcement of the second volume, an unusual stimulus has been given to the sale of the first.

THE SHEPHERD.

EDITED BY J. E. SMITH, A.M.

No. 6.]

MARCH 1, 1837.

[Price 2d.]

THE PRINCIPLES OF THE SHEPHERD,

MAY be called Pantheism, Universalism, or Catholicism, or by any other word which expresses Universality.

Pantheism implies that every thing, great or small, good or evil, wise or foolish, is the result of the active and conscious operation of the Universal Male (Spirit) in co-operation with the Universal Female (Matter). Consequently, all doctrines, systems, customs, and morals *positively* originate in God and Nature (jointly), and form component parts of a system of progressive training for mankind.

But the only true religion is the acknowledgment of this fact, and the retirement of faith and worship within the true sanctuary of the heart and mind.

MORE DELUSIONS.

"And be these juggling fiends no more believed
That palter with us in a double sense—
That keep the word of promise to the ear,
And break it to the hope."—MACBETH.

Who are those juggling fiends?—*Religion for one—Science for another—and Politics for a third.*

REVELATION has proved very faithful both to Jews and Christians. It is not yet falsified, and yet both parties have been deceived. There is always something about it so extraordinary, and so convincing, that those who have given it a patient and attentive consideration, must either be thoroughly assured of its truth, or nonplussed for a plausible objection to its testimony. There is such a keeping of the word of promise to the ear, in the prophetic department, independent of the historical evidence of miracles, that it is sure to stagger those whom it does not overcome. On the contrary, there is such a breaking to the hope, that even those who receive it are confounded, and those who reject it, reject it on this very account. It equally confounds its believers, and its unbelievers. It is hard to say which is under the grossest delusion—the one is obliged to rack his brains for excuses and apologies for the imperfections of his faith, and the other resorts to the no less clumsy and uncharitable trick of a universal charge of imposture, pious fraud and hypocrisy against all former generations. Nay, the Christian believer, after readily assenting to this charge of clumminess and uncharitableness against his infidel opponent, immediately enters into copartnership with him, as soon as the subject of inquiry is shifted from his own sectarian creed to the investigation of a rival faith. The pious Protestant, who insists upon implicit faith in all the minutiae of the four Evangelical lives of Christ, and who brands with unfair and prejudiced animosity the man who disputes the literal accuracy of these records, himself assumes the same petty hostility of prejudice—the same want of candour in judgment, in reviewing the evidences of the miracles of the Catholic church, or the divine commission of the Prophet of Mecca. Nay, he will even tell you from his own jaundiced imagination the history of Mahomet's *hypocritical arts*, and the motives which induced him to *pretend* to a divine mission; and then, having found these fanciful premises, he will finish his picture with a diabolical outline of the prophet's character, who could with such

imperturbable impudence, and placidity of manner, employ the name of God for so selfish a purpose as his own ambition, and defy even the majesty of the Son of God by entering the lists with him as a rival Saviour. The fellow takes it for granted all the while that Mahomet was an impostor. He thinks it unnecessary to prove it. He sees no *illiberality* in asserting it. The *liberals* agree with him! and surely that which liberals and Christians unanimously acknowledge, can never be considered as a breach of liberality! But we are at war with both Christians and Liberals (self-styled liberals), and despise their clumsy and illiberal modes of judging of their fellow-men.

There are difficulties in the lives of Mahomet and the Catholic saints not to be overcome, either by Protestants or Infidels—difficulties which depend upon historical facts, as clearly authenticated as any event in history. Neither imagination, nor imposture, nor chemical action, nor a fortunate combination of circumstances, will account for the events recorded. They must either be acknowledged as truths, or historical evidence must, in all shapes and characters, be for ever rejected. But so illiberal are the modes of argument adopted, that the very men who are most vehement in denying the truths of authenticated miracles, will even quote the poets of Greece as historians, and the historians of Greece as geographers, although the former are notorious for invention, and the latter for ignorance!

We merely allude to the great historical miracles of the Catholic church—those which stood the test of thousands of experiments, confirmed the faith of thousands of pilgrims, and removed the doubts and the fears of multitudes of sceptics.

We shall treat of this subject very soon. In the mean while we remark, that no particular party has been more or less deceived by religion than another—that the Jew is as much deceived as the Christian, and the Christian as the Jew—that both are equally deluded as the Mahometan, and the infidel is as far from the mouth of the labyrinth as either. They have all the same clue of "imposture" to lead them out of their difficulties—that clue is a false clue, which will only entangle them the more in the mazes of delusion; and fortunate it is for the moral dignity of the human race that it is thus wisely ordained of God. It is a most base and diabolical principle to weather the storm of conflicting thought—a principle whose whole aim and purpose is to demonstrate the treachery, the villainy, the hypocrisy, the falsehood, and perjury of the human race; and not only thus to denounce the race as a whole, but even to impugn the characters of the very best and wisest of men, who

have impressed the seal of their minds and morals upon succeeding generations, and become the spiritual and intellectual fathers even of their very revilers and blasphemers—a principle which, if it succeed in destroying the character of ages past, at the same time reduces the credibility and integrity of the present race of men to so low a pitch that it would be vain to expect any good to result from their philosophy or their morals. Fortunate, we say, it is for humanity that such a charge can never be substantiated. The animosity of the contending parties will destroy and refute it, and having tried in vain the demon-weapons of swords and battle-axes, charges of imposture and scowls of contemptuous and accusing hate, they will find their last and only resource in the simple and only intelligible confession, that there is one great Omniscient Power who superintends the elements of matter and thought—that He is the worker of all the mischief which half mad philosophers ascribe to Imagination or Imposture, and that that very mischief is a jewel in the crown of his Providence. In the whole list of arguments ever employed by controversialists, or devised by logicians, there are not two of more unmeaning, ungenerous, and inconclusive a nature than those two of "Imagination" and "Imposture." They are pitiful resources of the religious world on the one hand to get rid of the ascription of the authorship of Evil to God, and of the atheistical world on the other, to account for a class of phenomena, which puzzles its chemical philosophy. Ignorance and Prejudice can easily get over a difficulty that stands in their way, but Knowledge and Candour are more discriminating and more just in their judgment.

And what can science do to settle such disputes? Let it settle its own affairs first. Let it point out the cause of any natural phenomenon. It may tell us that fire melts iron, but it says nothing of the moving cause. It may tell us that the oxygen in the air makes the fire burn, but we are as far as ever from the mover. It may go a little farther, and say it is the hydrogen of the coals which burns, and the oxygen keeps up the flame, but not a word of the moving cause have we yet heard. Upon this point, a savage is as wise as a philosopher; much wiser than some philosophers, who, like certain well known enthusiasts in the mechanical world, are exerting all the ardour of their genius to discover the cause of a *perpetual motion* in nature without a moving will.

There are mysteries in science which are equally puzzling with those in religion, and almost identical in their nature. Men, however, do not fight about them as they do for religious creeds. Science is not the Lord of Hosts. That is one good feature in its character, which it owes most probably to its disconnection with the state. But it is not necessarily of a peaceful nature. Its votaries are as keen as theologians, and as revengeful as sectarians, but they cannot arouse the people in their interest. It is a kind of aristocratical species of knowledge. Its combats are therefore conducted in private with closed doors. But the Trinity itself is not more mysterious than some of the riddles of science. The common question for instance of the two electric fluids has several sectarian views, which are all equally unfathomable. Some say there are two fluids, others say there is only one, others say there is no electric fluid at all, but that electric phenomena are occasioned solely by the disturbance of the two elementary gases of the atmosphere—oxygen and nitrogen. The last is the most modern idea, and professes to be the most enlightened, but who can comprehend it? And suppose it were intelligible, it can only be so by supposing some third power to set the two gases in motion. But when you have imagined all the three, you find yourself as much bewildered as if you had been wading the depths of transubstantiation.

What are called proximate causes may be discovered by means of scientific investigation. Thus the proximate cause of day light is the sun, the proximate cause of candle light, is the candle. But these causes are themselves effects, the cause of which is beyond the sphere of science. Science, therefore, never can satisfy the enquiring mind—the higher he goes, the nearer he approaches the religious principle, and unless he dips his head into this empyreal cap, his science is nothing more than a body without a head, a collection of imperfect causes without a bond of union. The head of science is religion. The investigation

of causes necessarily leads the ingenuous mind to *the universal cause*, and that cause is the basis of all the philosophy of theology. No unprejudiced mind can be content without this foundation upon which to build its conjectural systems, and to which to trace its succession of proximate causes. But the abuses of a false religious faith, have so corrupted all the channels of theological science, that men in disgust have attempted to supersede religion with science, and point to proximate causes alone as the beginning and the foundation of their philosophy. But it is merely an attempt, an attempt too which has originated in passion, not in the cool discrimination of judgment—in passion roused by the intolerance of faiths, which not content with punishing their opponents with a moderate allowance of this worlds castigation, extend their vengeance to a world of spirits, and to ages of endless duration. This passion will cool as the evil which aroused it diminishes, and the Universal Cause will be acknowledged even by materialism itself to be the only allowable basis and apex of philosophy.

It is a common saying in these mechanical times, that practical science is the only useful and legitimate subject of instruction and investigation. If we understand this aright, it means that science is only to be cultivated when it leads, or promises to lead, to some good practical result. It has a thousand meanings in a thousand minds. The meaning intended to be conveyed by some, however, is, that any thing which has a tendency direct or indirect to lead to the belief or acknowledgement of a superintending Providence, ought to be discarded from the schools of education and philosophy. Now so directly the reverse of this, in our opinion, is the counsel of wisdom, that we consider that the whole end and aim of all instruction ought to be the delineation of the divine character as exemplified in his works, and the duties which we owe to our fellow creatures as members of one common family, whose parent and whose bond of union is God. The relationship between God and man is *less* required to be taught. The mind that perceives its own existence in God needs not to be told of any relationship. We are entirely dependent upon him for being, for thought, for will, for affection, passion, love, and hatred. We owe no duty to him, for "our goodness cannot reach unto him," and our wickedness cannot affect his feelings, or change the purposes of his will. We cannot serve him. It is he who serves us. "He that is greatest amongst you," said Christ, "is the servant of all." God is our servant; a moment's intermission of his labour and care would extinguish us for ever; a mere act of his will is sufficient to obliterate every vestige of our existence. Our chief duties are *social* duties. To the study and performance of those duties all the ingenuity and enthusiasm of man ought to be directed. The idea of a God is merely useful as a model of universal union, toleration, and impartiality—a starting point from which knowledge sets out—a goal to which it tends—an anchor on which hope reposes. God to man is an idea only, for it is only by the mind that we can perceive Him. The idea, however, is not the idea of a nonreality, but of a reality too vast to be perceived or comprehended, except by a mental conception. It is like the idea of truth, intelligible to all, but yet represented in shape and form by none.

This idea is more practical than any other idea in its tendency. If you delineate the character of an impartial God, you will teach impartiality to your pupils. If you delineate the character of God as partial and addicted to favoritism, what can you expect but a nation of bigots? This latter teaching is the teaching of the church. A universal God has never yet been recommended to the faith of the people. We have only the picture of the God of a sect—of an election—of a nation—a God, too, who is infinitely horrible as a moral judge. The practical tendency of such a theology is evident. God is a model for imitation. A *godly* man is one who is esteemed *likest unto God*, one who has more of God's image than ordinary people possess. Were the God of faith such as he ought to be, such a man would really be a good man, just, liberal, benevolent, and impartial. But so far is this from being the case, that *godliness* has become a cant term of reproach, and the more its professors resemble their God, the more unsocial, the more hideous they seem.

This has suggested to our modern materialists, the idea of get-

ting rid of God altogether, and supplying the place of religious with political instruction. Politics are now in full cry with the Utilitarians. All moral and religious instruction is included in the superlative science of political economy. This is a very natural transition. At the first reformation, the religious principle was paramount in importance. It was corrected according to the wisdom of the age. The political principle stood as it was, and had ever been. The latter now stands exposed in the nudity of ignominious shame, and demands correction. Having the precedence at present, it happens as it always did, and always must, that those who catch the spirit of the movement without embracing its ulterior consequences and universal relationships, naturally enough exemplify in their habits of thought the most prominent feature of the political department of progress, namely, materialism. They are the puritans of a political age, and just as the fifth monarchy men expected to establish Christ's Kingdom without laws, these modern fifth monarchists pretend to establish a heaven upon earth by the reform or abolition of laws. We wish them joy in their "wild goose's errand." They think they have got out of the regions of mystery, because they have got amongst tangibles and visibles. They are much mistaken; there is nothing in the whole tablet of controversy more mysterious and indeterminate than a political question or argument. It is a mystery as deep as hell, and as high as the heavens. It matters not what is the subject. Not only can much be said on both sides, but truth is literally "all alive" on both sides; and, an intelligent, unpledged, and unpartied mind, having heard a leading political question discussed by two men of equal talent, would at the conclusion of the debate be found in the same predicament as at first, allowances being made for the advantage gained by the last speaker. It is not the knowledge nor talent, nor truth, nor virtue, of the movement party that determines us in its favour; it is the simple fact that man is a progressive being, and that old systems are not fitted for new minds. Therefore we say to the people, move on, but in moving, you are sure to be deceived and bewildered in the mazes of political mystery.

Here is a nut for you to crack—if any man can crack it for us, we shall accept the kernel with gratitude.

"As long as there are independent nations, governed by different laws, there never can be political quiet, nor an adequate reward for labour in any one country."

Nations are like religious sects, they will destroy each other, even when they are at peace. Tariffs, Manifestoes, Ukases, Protocols and Treaties, are merely fleets and armies in disguise.

WHY ARE WOMEN MORE NUMEROUS THAN MEN?

There must be some substantial reason for the surplus of female population. Some philosophers would content themselves with "combination of circumstances" for a reason, and think no more about the matter. Some might even go so far as to say there is no reason for it, it is merely a circumstance. Mr. Sadler, in his ingenious but somewhat confused reply to Malthus on Population, treats the subject in a more philosophical manner, and he begins the inquiry as all such inquiries ought to be begun, by taking it for granted that there is a reason for it, a good and wise reason for it, or it would not so be. If he had acted up to this profession of principle on other points of doctrine, his work would have been more valuable than it is; but sectarians are sure to overlook the idea of divine wisdom and design whenever their own dogmas would be endangered by the confession. Why should not the Malthusian population check of vice and misery form a part of the divine plan, as well as the surplussage of women over men? Mr. Sadler, however, considers it blasphemy to represent the Deity as being so cruel as to put a check upon population by vice and misery, but it is not blasphemy to represent him as keeping a large fire for burning naughty boys and girls! One, however, may learn a great deal of rich truth from Mr. Sadler, and his answer to the above question is, in our opinion, valuable.

There are more women than men married. Many men marry more than once, and when they do take a second wife, they more frequently take a maid than a widow. More widowers than widows marry a second time. Therefore, more women

than men undergo the ceremony of marriage. There are more widows than widowers alive in all countries. Our population reports have not thrown any light upon this subject as regards our own country, but the following is an official view of the question in the population of Prussia. Out of 14,654 marriages there are of

| | |
|---------------------------|--------|
| Bachelors and maids..... | 10,551 |
| Bachelors and widows..... | 1032 |
| Widowers and maids..... | 2333 |
| Widowers and widows..... | 738 |

14,654

From which it appears that there are 12,884 first female marriages, and only 11,583 first male marriages, giving a majority of 1,301 in favour of the women, showing that the ladies have a larger share of matrimonial compost than their more independent rivals and enemies in pantaloons. The surplus of women, therefore, is merely a supply proportioned to the demand.

But it is very strange that although there are always more women than men in a country, there are more males born. We have seen no plausible reason for this fact. Males are more difficult to rear. They are shorter lived. Much as women suffer in life, there is more waste of strength from birth to death in the male, than in the female. Science may possibly teach us the cause of this, but we want to go beyond the cause, we want to know the reason why it should be so. Is it a prospective reservation in nature for a state of society, when males shall be reared as successfully as females, and the value of the latter be increased by the scarcity of the commodity, as a compensation to woman for the suffering she has experienced in the old world? The curse of Eden has been inflicted upon woman. Surely the promise of its removal will also be fulfilled.

ON PROPOSITIONS.

To say that my papers altogether formed a regular system would be too much to say; on the other hand, that they were mere isolated essays, would be too little. I always presume that my readers are acquainted with all my articles, (the first of which appeared in No. 3) as it would be impossible for me to repeat in every succeeding paper all the definitions &c., which are requisite to the understanding of every one of them; and, this more especially, as I limit myself to two columns, partly because that is quite enough for many of my readers to digest, partly because I think my essays too unentertaining to occupy a larger space in the *Shepherd*, and partly because my own multifarious occupations prevent me from devoting a very long time to their composition.

My present dissertation will be a purely logical one, as I find, that if my readers are unacquainted with logical technicalities, I, who am rather scholastic, shall not be able to render myself intelligible. I am candid enough to own, that this paper will contain little more than is to be found in the works of Alldrich, Bishop Whateley and others; but as the *Shepherd* is published for the world, for those that know nothing, as well as those that know something, I feel I should not act justifiably, if I did not consult the interests of the latter class of the community.

We saw in our last, that some terms had a wider signification than others, and even included the others in their sphere. Thus "man" included "Socrates, Plato," and so on. Let us now see how we express the relation between the particular and the general term, between "Socrates" and "Man." In what relation does "Socrates" stand to "Man?"

The following: "Socrates is a man." The relation between them is expressed by the addition to the two terms of the word "is," and the whole sentence is called a proposition,* though as we shall soon find there are other propositions, of quite a different sort.

We will consider this sentence, and find what it consists of. In the first place, there is the term "Socrates," and what does So-

* In a note to my essay "on Matter" p. 30, I gave the different parts of a proposition, but too shortly to render myself intelligible to all.

crates stand there for? Why that something may be said of him. That it may be said of Socrates that he is a man. There is one term then of which something is said; and the third term "Man," expresses the something which is said of him. It merely stands there to say something about Socrates. Let us now take another proposition. "Socrates is not a horse." The first term here is the same as before, and the third term stands here to say something of Socrates, viz.—that he (Socrates) is not included in its own sphere. These propositions then express a contrary relation, the one saying that Socrates is included under a certain conception, the other that he is not included under another conception. And what gives the distinguishing mark between these two relations? Manifestly the use of the word "is," in the first case, and of the words "is not" in the second.

The term of which something is said (for example Socrates) is called the *Subject*.

The term which is said of that subject, (for example, man, horse) is called the *Predicate*.

And the term which expresses the relation between them, ("is," "is not") is called the *Copula*.

Now if my readers are sharp, they will have found a difference between the parentheses inserted in the above definitions. I have used the words "for example" before the words "Socrates, Man, Horse," but before the words "is, is not," the words "for example" are omitted. Was that an oversight of mine? No!

There are thousands of *subjects* in the world, and thousands of *predicates*. Instead of saying "Socrates is a man," I might have said "Eclipse is a race-horse," "Grimalkin is a tom-cat." In short there is no end to the terms I might have used, and all would have equally answered my purpose. "Socrates," therefore, is only an example of a subject, "man" of a predicate.

But is there an infinite number of Copulas? Are there even twenty ways of expressing the relation between subject and predicate? No! Take any number of terms you please, and you will find the only relations between any two of them, are, that one *is* or *is not* the other. Thus a rose is red, *is not* blue, is a flower, *is not* a bird, and so on through the whole of Johnson's Dictionary. Hence the words "is," "is not," are not examples of the Copula, but the only Copulas.

Some propositions indeed seem to militate against this assertion, as "Alexander was King of Macedon," but "*was*" is but an inflexion of the word "is," and when I say "is" "is not" are the only Copulas I include under these words all their inflexions, such as "are," "am," "was," "were," &c., &c.

Even such propositions as "Socrates talks" have three terms, though they consist of no more than two words. "Talks," is but a grammatical form of "is talking," so that we still have our three terms, though in a concealed form. "Socrates" the subject "is" the copula, "talking" the predicate.

And here I must remark that every opinion, true or false, must be uttered in the form of a proposition—nay, that were it not for propositions, truth or falsehood could never be uttered. If I merely ejaculate the single terms "Mermaid," "Centaur," I utter no truth or falsehood. But if I say "a Mermaid is an actually existing animal," then I run the risk of being called a liar.

We have seen above, that a proposition may be comprised in two words, and yet have three terms. The contrary often happens, viz., that two or three words may constitute but one term. Thus in the proposition, "lighted coals are hot" "lighted coals" are the subject, not "coals" simply, as indeed it would be going too far to say "coals are hot," without limiting our use of the word "coals" to such as are lighted. Let the logical student remember that he has nothing to do with grammatical forms, that "a subject is that of which the predicate is spoken," and that whether it be expressed in one or fifty words is no affair of his.

The example we have principally dwelt on, viz., "Socrates is a Man," expresses the relation between an individual and a species. A *species* is that which may be predicated of several individuals, thus—"man" may be predicated of several individuals, as "Socrates, Plato, &c." Some terms are so general that they may be predicated even of several species: thus "animal" may be predicated of "man,

horse," &c. &c. A term of this more extensive kind is called a *Genus*; and I would have you bear in mind that adjectives, such as "red," "white," &c., may be predicated in the same manner as genera and species; indeed, the expression "a rose is red," means "a rose is a *red thing*," in other words, that the rose is included in the class of red things.

Well, then, the subject need not be an individual, but may be even a whole species, thus—"Man is an animal" where the species "Man"—not an individual man—is spoken of. Again a general term may be applicable to some members of a species, but not to all. Thus it would be false to say "All men are black!" but perfectly consistent with human facts to say, "Some men are black;" while, on the contrary, "all men are animals" is true enough.

We may thus divide propositions into three kinds:—

1. Those, the subject of which is but *one individual*, as "Socrates is a Man." These are called *singular*.

2. Those, the subject of which includes every member of a species, as "All men are animals." These are called *universal*.

3. Those, the subject of which includes merely *some members* of a species, as "Some men are black;" these are called *particular*.

The above division is called a division according to quantity; and it will be found that the division is perfect. What number do we know of that is not "one" or "many" (i. e., *some*, but not all) or "all?" Certainly none. Therefore, all propositions must be *singular, universal, or particular*.

Another division of propositions arises, when we class them into those that have the sign "*is*," and those that have the sign "*is not*," the former of which are called *affirmative*, the latter *negative*, and this is termed a division according to quality.

We have as yet touched on no propositions but those that express a relation between subject and predicate. But there are other relations, as that of cause and effect. Thus if you wish to warn a boy, that a broken window will be the consequence of his throwing a stone, the relation expressed will not be that between subject and predicate; you don't tell him that "a thrown stone is a broken window," you merely say that one is consequent on the other. The form of expression you would use is this: *If you throw the stone, you will break the window.* A proposition of this form is called a *hypothetical* proposition, and the first part of it, viz., "if you throw the stone," is called the *antecedent*, and the other part the *consequent*.

There is a third relation, namely, that between several propositions, which are so peculiarly circumstanced that one of them must be true; and that on the truth of this one depends the falsehood of all the rest, though which is the true one is not specified. An example of these propositions is this: "Thomas Jones is either tall or short, or between both." I have not said which of the several propositions (T. J. is tall, T. J. is short, T. J. is between both) is true, but I have said that one is true and one alone. A proposition like this is called *disjunctive*.

This third division is one according to relation, and, considered in this light, propositions are either categorical (i. e., expressing a relation between subject and predicate), hypothetical or disjunctive.

I fear this paper would not have pleased poor Robert Seymour's Dustman, who wanted "something short, and not werry dry," but as it is impossible to understand Kant's system, without knowing the matters contained herein, and as I intend speedily to introduce my readers to that philosopher's categories, I hope they will not grumble very much.

I have mentioned the name of Bishop Whateley, and cannot close this article without expressing my very great respect for that prelate; not that his "logic" is a first rate work, there are many continental systems, far, far, superior. But I do say that at a time, when the clergy, instead of being patrons of learning, were turning Evangelical, sneering at "human intellect," "Arms of flesh," in short were using the most blackguard arts to secure the favor of an unthinking populace, the conduct of Dr. Whateley in standing forward as a defender of the admirable and unpopular system of Aristotle will stamp his name with a lasting honour.

Review.

CONFESSIONS OF THE CLERGY.

The "Christian Citizen."—*A sermon preached in aid of the London City Mission, at the Poultry Chapel, December 6, 1836. By the Rev. JOHN HARRIS, author of "Mammon," the "Great Teacher," &c.—12mo. p. 114. Ward and Co.*

In our first Number we took occasion to mention the above-named author as the successful competitor (out of no fewer than 143), for a 100 guinea prize essay on the "*Sin of Covetousness in the Church!*" We have no doubt that the very love of money led him (as well as the other candidates) to write that said essay *against* the love of money. This, as we said then, is funny enough; but the production before us is even more singular. Here we have the same reverend gentleman preaching and publishing a ranting, tearing sermon, showing up the inefficiency of the Christian religion to produce good morals in the very metropolis of Christianity, London; for the purpose of demonstrating to the Christian world that the Gospel is the only remedy to remove the depravity which he has been raking and conjuring up in the said metropolis! where, if the teaching of our parsons were of any use to morality, the people should be the most moral upon earth! Really our divines are determined to let the cat out of the bag; they are everlastingly condemning themselves out of their own mouths. If their teaching is indeed so unavailing, why continue it? why not try some other system of making their fellow-creatures virtuous and godly? Is not the tree known by its fruit? But what says the reverend gentleman of the fruits of parson-tuition? Why he says, that "One of the most affecting pages in the history of the world, is that which presents to the eye of the Christian a tabular view of its religious state. If we suppose, according to the usual estimate, that the inhabitants of the world amount to 800,000,000, then the whole, in round numbers, may be thus divided—Pagans, 482,000,000; Christians, 175,000,000; Jews and Mahometans, 143,000,000. O what shame should cover the Christian church, that such should be the state of the world—of Christ's world—1800 years after he has died for its redemption! [It looks very like wagery in Mr. Harris to put an ! here]. More than three-fourths of the human race are in ignorance of him, or in avowed alienation from him! But there is a fact which should be felt by every Christian inhabitant of this great city more deeply still—the fact, that the religious condition of London forms a striking epitome of the religious condition of the world. Divide its 1,500,000 inhabitants—as we have just divided the population of the world—into three classes. Let there be the openly religious—the occasional and worldly attendants on the ordinances of religion; and the regular worshippers of God. Let the first class stand for the Pagan, and the second for the Jewish and Mahometan, (very charitable!) and the third for the Christian division of the world, and you will find that the proportion which they respectively bear to the whole population of London is about the same which those three great divisions respectively bear to the whole population of the world." * * *

"Appalling, then, as is the religious state of the world, it is, I repeat, still more startling to think that the religious condition of London—London in the nineteenth century of the Christian era, in the third of the Protestant Reformation, of *favoured* London, is just its epitome. [Observe, *favoured* is put in italics—not by us].

"But do you ask for a brief description of the state of that first great division (the Pagan inhabitants of London)—650,000 ungodly human beings? What is their state?—It is a condensed mass of heathenism, which, if drawn out and diffused over a large space, in which it could be examined in detail, would amaze and alarm you into benevolent activity. What is their state?—It is a concentration of depravity so virulent that it might suffice to inoculate a continent, a world with vice. What is their state?—It is as bad as the most perfect system of evil which the tempter could devise, and keep in constant operation, with no other check than the feeble voice of human law, can make it. What is their state?—Twelve thousand children

are always training in crime, graduating in vice, to reinforce and perpetuate the great system of iniquity; three thousand persons are receivers of stolen property, speculators and dealers in human depravity; four thousand are annually committed for criminal offences; ten thousand are addicted to gambling; above twenty thousand to beggary. [We apprehend these last do not get much out of the Evangelizers, who, when a poor man asks for bread, give him a stone—a fanatical tract]. Thirty thousand are living by theft and fraud. [Are not the parsons living by deception—a *genteel* way of thieving?] That this dreadful energy of evil may not flag from exhaustion, it is plied and fed with three millions' worth of spirituous liquors annually; twenty-three thousand are annually found helplessly drunk in the streets; above one hundred and fifty thousand are habitual gin-drinkers. and about the same number of both sexes have abandoned themselves to systematic debauchery and profligacy. Such is their ordinary state; nay, it has grown worse while I have been describing it. Like the magic erections in Pandemonium, in addition to the five thousand temples of drunkenness and vice already existing, other 'fabrics huge rise like an exhalation.' The statistics of evil are ever on the increase.

"But does not the return of the Sabbath form an exception to this state? It does, but an exception of the most fearful kind, for it consists in their state *then* being aggravated tenfold; six hundred and fifty thousand human beings then stand up and say, in the face of Heaven, 'There shall be no Sabbath;' we will rest from our ordinary labour only to toil in sin; the day shall be set apart to evil." And in obedience to this fearful decree, issued as from the throne of wickedness, the temples of vice are early thrown open, and thronged with impious devotees. The press issues its weekly manual of slander and sedition, impurity, and blasphemy [and the parsons mount their rostrums to slander and blasphemy in another way—*aside*]; every minister of evil [clerical also] is then in full employ aided by numerous helpers, called in for the occasion. In many districts the ordinary market is quickened into the bustle and riot of a fair; the quiet of the week is broken up by the carnival of the Sabbath; the great volcano of iniquity heaves, and rises, and discharges its desolating contents into the country for miles around; every available form of art is pressed into the service of sin; the whole Satanic system of depravity is in active and universal operation, and vice holds its saturnalia. Such is their Sabbath state.

"When the Almighty would impress Jonah with the extreme depravity of Nineveh, he spoke of it as a gigantic personification of evil, which had actually come up, and obtruded to his very throne. But were the guilt of the metropolis to be embodied, who could describe its colossal stature, its Titanic daring, and revolting aspect? When he would show Ezekiel the abominations of Jerusalem, he led him through successive chambers of imagery, on the walls of which were vividly portrayed all their dark and idolatrous doings. But were a similar representation of the abominations of London to be attempted, what is the emblematic imagery that would do them justice? Where are the colours dark enough, and the imagination sufficiently daring, to portray the guilty reality? There must be seen groups of demons, in human shapes, teaching crime professionally, initiating the young in the science of guilt, and encouraging their first steps towards destruction. There must be trains of wretched females, leading thousands of guilty victims in chains, and leading them through a fearful array of all the spectres of disease, remorse, and misery, ready to dart on them. There must be theatres, with a numerous priesthood pandering to impurity, and offering up the youth of both sexes at the shrines of sensuality. There must be splendid porticoes, on the entrances to which must be inscribed **HELLS**; and on the breast of each of those entering must be written, in letters of fire, **HELL**. There must be a busy Sunday press, worked by the great enemy himself, in the guise of an angel of light, and dispatching myriads of winged messengers in all directions, on errands of evil. There must be infidel demagogues, 'mouthing the heavens,' and gaping crowds admiring the skill that blindfolds them for destruction. There must be gorgeous palaces, in which death and disease shall appear holding their court; in which busy hands shall be seen distributing liquid fire to crowds of wan and squalid

forms; and each of those palaces must be shown standing in the midst of a jail, a poor-house, a lunatic asylum, and a cemetery [and a church and a chapel], all crowded, and leaning over the mouth of the bottomless pit. And over the whole must be cast a spell, an all-encompassing net-work of Satanic influence, prepared, and held down, and guarded by Satanic agency. And to complete the picture, three hundred thousand [real] Christians passing by without scarcely lifting a hand to remove it."

And all this in the nineteenth century of the redemption of the world! Surely London must be on the eve of being burnt up with a shower of brimstone and fire from Heaven, or engulfed in the bottomless pit by an earthquake! But, perhaps, God himself cannot dissolve the spell which, according to the reverend gentleman, hangs over this ill-fated city, all-encompassed, as it is, with a "net-work of Satanic influence, prepared, and held down, and guarded by Satanic agency!" Mr. Harris, as is usual with his craft, seems inclined to give Satan more power than God, or why should not God be represented at the head of the three hundred thousand Christians, scarcely even raising his voice or his arm to disperse the hosts of Satan?

But, to be serious, we altogether deny the reverend gentleman's statistics of crime. Vice enough, no doubt, exists in this metropolis; but the parson's self-righteousness and uncharitableness, and his meretricious style of oratory, have magnified it beyond all compass—just as

"Love can see beauty
Where there is none,"

So a blind, furious, canting zeal, can see evil in every feature of society that does not bend the knee to its own fanaticism.

None but a benighted parson could draw such a "picture of London," as the Rev. Mr. Harris delineated; and what is the remedy proposed for all the monstrous depravity which he has conjured up? Why, Christian instruction societies and city missions!

No delusion can be more complete. True religion, true morality, must spring from better sources than from creeds and ceremonies, for when the former are established, the latter must pass away. But there is a time for all things; few of the people are yet prepared for a better system than that taught by our parsons. And even that gloomy system, insufficient as it is to produce good morals and virtue among men, suffices to alleviate or prevent some evil; it gives that kind of consolation in many of their bodily and mental calamities, which no medicine of this world can afford; and it prevents them from falling into a still more gloomy, atheistical philosophy, which would deprive man of every sublime hope, every ennobling sentiment.

[As a contrast to the above parsonic description of unchristianized London, let us here exhibit a picture of the parson's God, and the redemption which he purchased from himself by the sinking fund of his own blood, which sinking fund, like that of William Pitt and Dr. Price, has rather increased than diminished the debt:—

REV. MR. HARRIS'S CREED.

"I BELIEVE in a God of infinite love and infinite cruelty—a God who will satiate the souls of His chosen with the richest blessings of omnipotence—and a God whose justice is not satisfied with a few stripes, or a few hours, days, weeks, or years of punishment inflicted on his victims, but who confers an eternity of life, in order that he may inflict an eternity of punishment—whose great prison-house of souls is not a penitentiary, nor a house of correction (it is Popish heresy to paint so relenting and reasonable a Deity), but a house of vengeance, insatiable, unappeasable, and everlasting—a God who would have engulfed the whole human race in this 'bottomless perdition,' had not his son in mercy condescended to bear a few years' humiliation in human life, and six hours' torture on the cross, to appease him, for which condescension the Father remitted the punishment of believers, and swore by His honour and glory, that he would save them with an everlasting salvation. But he still remains, and ever will remain, relentless to the great bulk of mankind, whom the furies of Heaven, Earth, and Hell, are now rapidly multiplying by the increase of population, infidelity, and Radicalism, to cram the dungeons of eternal gloom, regions of

sorrow—doleful shades, where light and hope do never come.' In this faith I rejoice, and am glad, for MY God hath saved ME from the fear of Hell!"—[pious reflections thereon.] "But, oh! what an awful thing it is that WE have not yet sent the Gospel amongst the Heathen, amongst the poor, amongst the artisans of England, to save them from the jaws of a devouring God, of infinite mercy and relentless justice! The rich and the comfortable classes alone have received the faith, and they have appropriated the riches of the world so exclusively to themselves, that they have forced the poor to steal and sin against God—thus driving men into Hell, instead of leading them out, and eternally damning that class of society for which Christ died, and to which the Gospel was especially sent. Oh! money!! money!!! what ruin and desolation thou hast occasioned! and yet it is only those who have a comfortable stock of thee that are saved: I hate thee, and have written against thee; but I did not compete for the hundred guinea prize from the love of thee, 'twas from the love of God, from whom cometh down every good and every perfect gift; and is not a hundred guinea prize a good gift?—Verily, they who say 'no,' think otherwise."

Verily, there is something exceedingly tragicomical in the mechanism of this world. But there is one small sentence of the Bible which throws great light upon it, tho' the clergy, as usual, utterly neglect to point it out:

"The Devil is the God of this world."

Thereby hangs a tail, and a little waggery at the end of it.—Had we the hundred guineas to spare, we should willingly spend them on the following prize essay:—

"How can it be demonstrated from the data of Natural and Revealed Religion, that the God of this world is a Wag?"

ACOUSTIC CHAIR.

Mr. Dick, of Glasgow, in his *Christian Philosopher*, thinks it highly probable that, by means of acoustic tunnels, a clergyman sitting in his own room at Edinburgh, might address a congregation in Musselburgh, or Dalkeith, or even in Glasgow. And Mr. Curtis, the inventor of many ingenious instruments applicable to the science, when speaking of the philosophy and diseases of the ear, asserts that intelligence might be conveyed by his acoustic chair, from St. James's to the houses of Lords and Commons, and from London to Windsor. On the same principle, a song sung at the Italian Opera House, might be heard at all the other theatres in London; and Mr. Wheatstone has actually performed something of this kind. In these days of universal improvements, might not these suggestions be turned to further and good account?—*Literary Gazette*.

[In these days of political excitement, the whole nation might be made a strangers-gallery for the Parliamentary debates. Let the country be well laid with acoustic pipes, and every man have the arteries of political science conducted to his own house. Every speaker would thus address the whole nation at once, and have his sentiments conveyed directly to the ears of the public, without the alloy with which they must always be intermixed in passing through the medium of a reporter's brains. Might not one parson by this means suffice for a whole county, and the Bishop of London be saved the disagreeable necessity of appealing to the faith and conscience of the public for a voluntary subscription to support an Involuntary Establishment? Church-rates might then be advantageously got rid of, and pipe-rates substituted in their stead. The infidels would willingly pay the latter, as they would have the use of the pipes for six days in the week, and could easily get rid of the nuisance on Sunday by "turning the cock." We understand that acoustic pipes have already been successfully attempted, in the Government offices. These are but the beginnings of wonders. The whole world will be laid with pipes some day, and one king will reign over all of us. Men and women will then breed like rabbits, chemistry will convert the rocks into bread, and the rivers into claret and champagne, and the astronomers of the moon will declare, with alarm, that the earth is all alive, and presents the appearance of an old misty cheese about to crumble to atoms with excess of vitality. O Malthus and Martineau! you will then be sleeping snugly together in one bed!]

SCOTCH PIETY.

IN Scotland it is accounted very sinful to whistle, to sing a song, or play on a musical instrument on a Sunday. Some of the clergy do not object to *sacred* music, accompanied by the piano, but, from fear of offending the ears of the groundlings, they do not indulge in this innocent pastime. It is also sinful to read a newspaper, or a profane history, or any scientific work. Nothing but bibles, sermons, spiritual songs and hymns, are legitimate literary employment for this day of sackcloth. You may talk as much slander as you please; you may tell stories about ministers, elders, and kirk sessions, that will set the table in a roar, and you may even drink as much Scotch toddy as will satiate your thirst; but sing not, whistle not, read not a newspaper, for the Lord marks all these things in a book, and he will put you in mind of them at the day of judgment. How it came about that slander and frivolous conversation were so tenderly treated by the stern devotees of the North we know not, except that it would have damned even the elect themselves if such universal transgressions were reckoned deadly sins. Nature, however, is too strong for fanaticism. Intercourse with nations of a more generous spirit is rapidly subduing these irrational prejudices in the sons and daughters of the Covenant.

In a discussion a few days ago, in Glasgow town council, on the question of a grant of money, for the restoration of the Cathedral, Mr. McGavin, a zealous Protestant, opposed the motion, and took occasion to speak of a pamphlet which had been published on the subject, as a blasphemous production, because it had called that Popish cathedral a specimen of "*Christian Architecture*," and had also by another outrage against orthodoxy designated it as "the ancient temple of the Almighty." "a title," said the pious gentleman, "which is appropriate to no other temple, than the temple of Solomon." Happy Caledonia! thou art the scabbard of the sword of the spirit!

THE TRADE.

WE have been amusing ourselves by looking over the advertisements of the last Number of the *Evangelical Magazine*, No. 170. We shall record a few of them in the columns of the *Shepherd*, just by way of illustrating the ways and means of the pious prize-mongers, money-rakers, and soul-savers of this wicked and sinful generation.—A watchmaker advertizes for an apprentice. The boy must be the son of *pious* parents (*if possible*)—but as the watchmaker is determined to have an apprentice of some kind, pious or impious, he thus expresses himself: "The son of pious parents would be preferred." Now, begging the watchmaker's pardon for calling him to account, we deny this *in toto*. "A large premium would be preferred," would have been more literally correct, for we are pretty sure that money and a *respectable* appearance will conceal a multitude of heretical defects, even from a pious watchmaker; and the son of a poor and industrious couple would have very little chance of success even without competition from the family of a wealthy non-professor. Another advertizes for a servant of all work. "The preference will be given to one who is a member of *some* Christian congregation." This is a very liberal master, indeed!—*some* Christian congregation!—it matters not which—Papist or Protestant, Unitarian or Trinitarian, Ranter, Jumper, Pantler, Single tongue or Cloven tongue, New Jerusalem or Old Jerusalem-ite. Honesty is not mentioned, nor cleanliness: the membership is quite sufficient either to atone for the want or guarantee the possession of these virtues. Another advertizes for a respectable female for the haberdashery business. "A person of decided piety would be preferred, as she would be required to attend an Independent chapel." Just so—this is the way the churches are filled, and hypocrisy cultivated, by offering a premium for the outward forms and ceremonies of the trade! A Dissenter near London advertizes for "a young man of *decided piety*, who understands the cheesemongery and grocery business." There is a little bit of shrewdness in this advertizer, however; he appears to have had suspicions that *decided piety* was not altogether sufficient of itself to satisfy his purpose, for he

adds, that the young man must also be "of obliging and industrious habits." The *decided piety* is the bait which he wants for the trade; the habits are the useful and profitable virtues, which will handle the bait with advantage. A young man, a miller, advertizes for a master—"a pious employer is preferred."—A pious miller wanted! Enquire of Shackell, the thief-catcher, if he knows of any pious persons who undertakes to remove goods in town or country!—"A pious young man wanted for the drapery business—he must thoroughly understand the country trade (that is, cozening, persuasion, puffing, varnishing, glossing, in fine the most refined and Christian mode of swindling); he must be a member of a Christian church." Another young draper is also advertized for in the same page, but he must not only be pious but *decidedly pious*—that's the cant expression now. He must, of course, be an adept, moreover, in all the tricks of the trade. "Culy's boarding house"—there's a go!—recommended by a whole covey of parsons to their friends, as a house affording all the comforts of a private family—a pious landlord, no doubt, with good reasons for being so—"A respectable widow wants a pious, elderly woman, to lodge with her." There's a union! piety and respectability to lodge together. What an inducement for a pious lady who loves the praise of this world!—"Two thousand sermons for sale—being the manuscripts of an Independent minister—decidedly Evangelical—for all occasions—a real treasure to a young man entering the ministry." What a world of trouble it will save this young man! Sermons are not like clothes, the worse for wear. Old sermons are frequently better than new. A slop-shop for such cast-off apparel would be a glorious trade for a pious speculator in these days. Besides these, there are several pious and religious boarding-school advertizements, from which it is evident that Godliness (or religious principles) is a marketable commodity which people accumulate, advertize for, and puff off, as other speculators do with loans, mortgages, reversions, annuities, literary and philosophical acquirements. And yet Godliness is peculiarly sacred and undefiled by the vanities of the flesh!

The effect of these advertisements is evidently the encouragement of hypocrisy. Parents point them out to their children as inducements to piety. The gain or worldly principle is employed to create an unworldly principle, and in the same breath that a mother tells her daughter to love not the world nor the vanities of the world, she invites her to the cultivation of church-going, Bible-reading and praying habits, by the worldly benefits to be derived from their possession! "You see, my dear, that a preference is given to the Godly and the pious, when a situation is applied for. Go read a chapter, Polly, and an evening prayer. There's a dear!"

BISEXUAL PANTHEISM OF CHINA.

THE arithmetical diagrams of *Fo-hy*, as we find them in the *Yao-King* (one of the canonical books of the Chinese), bear some resemblance to the mystical numbers of the Greek philosopher, Pythagoras, who, although he enlarged the bounds of science, appears to have allowed his speculations to be perverted by dreams of mysterious virtue, in certain numbers and combinations. In the same way, the Chinese make use in divination, and various other branches of their mock philosophy, of the *Pakua*, or eight diagrams of *Fo-hy*, which, if they mean anything, may be supposed to represent a system of binary arithmetic. Chinese philosophers speak of the origin of all created things, or the *premier principe matériel* (as it has been called in French translations), under the name of *Tao-keih*. This is represented in their books by a circle with a curved line like an S drawn across it. On the semi-diameter of a given circle describe a semi-circle; and on the remaining semi-diameter, but on the other side, describe another semi-circle.

The whole figure represents the *Tao-keih*, and the two divided portions, formed by the curved line, typify what are called the *Yang* and *Yin*; in respect to which this Chinese mystery bears a singular parallel to that extraordinary fiction of Egyptian mythology—the supposed intervention of a masculine

feminine principle in the development of the mundane egg.* The *Tae-keih* is said to have produced the *Yang* and *Yin*—the active and passive, or male and female principle, and these last to have produced all things. The heaven they call *Yang*—the earth *Yin*—the sun is *Yang*—the moon *Yin*: and in the same manner the supposed analogy is carried throughout all nature. One might sometimes be led by their definitions of the *Tae-keih* to suppose it an intelligent being; but the general drift of the system is plainly material, as it does not discriminate between the creature and the Creator. This dogma of materialism, however ancient it may be in its first origin, became especially cultivated, or, according to some, *originated* in China during the Soong dynasty, which preceded the Mongol Tartar conquest. The learning and science of the Chinese, such as it was, being then much in vogue, some celebrated commentators on the ancient books appeared about that time, the most famous of which was the *Chootsze*, before named. At length, under *Young-lo*, of the Ming dynasty (about the 14th century), a joint work was composed, by name *Sing-ly-tâ-tseun*, or a complete exposition of Nature, in which the mystery of the *Tae-keih* was fully treated of. *Chootsze* thus expressed himself:—"The celestial principle was male, the terrestrial, female. All animate and inanimate Nature may be distinguished into masculine and feminine: even vegetable productions are male and female, as, for instance, there is female *kemp*, and male and female *bamboo*—nothing exists independent of the *Ying* and *Yang*." Although the Chinese do not characterize the sexes of plants, and arrange them systematically, as we do, after Linneus, they use the above phraseology in regard to them. Thus, heaven, the sun, day, &c., are considered of the male gender; earth, the moon, night, &c., of the female. This notion pervades every department of knowledge in China. It exists in their theories of anatomy and medicine, and is constantly referred to on every subject. The chief divinities worshipped by the Emperor, as high priest of the state religion, are Heaven and Earth, which, in this sense, appear to answer in some degree to URANOS and GHEE, in the cosmogony of the Greeks.—*The Chinese*, &c. By J. T. Davies, F.R.S. London, 1836. 2 vols. 8vo. vol. ii. pp. 66-67.

* "This idea seems to have been very general," "In a mysterious passage of the *yajur-veda*, Brahma is spoken of, after his emanation from the golden egg, as experiencing fear at being alone in the Universe: he therefore willed the existence of another, and instantly he became masculine feminine. The two sexes thus existing in one God were immediately, by another act of volition, divided in twain, and became man and wife. This tradition seems to have found its way into Greece; for the Androgyne of Plato is but another version of this oriental mythos."—*The Hindoos*, Vol. I. p. 166.

THE HOLY ALLIANCE.

THE monarchical and democratic principles are not less necessary for the government of society than the laws of attraction and repulsion for the revolutions of the planets. For this reason we cannot enter into the feelings of those visionaries in politics, who rail, and fume, and smoke, and belch out their venom and hate, against even the fiercest and sternest despotism of the age. Despotism is a pair of reins for popular progression. It will exist only until there is tact and discretion and unanimity sufficient, in the public mind, to establish a universal monarchy. Despotism is essentially necessary as long as the people are fools; and are not the majority of the people fools? are not their teachers fools? their reformers fools? their patriots fools? their agitators fools? If not, why are they at variance?

There are two extremes of national government, viz., despotism, or the action of one upon all, and populism, or the action of all upon one; the former must use magisterial power, the latter must use moral and intellectual unanimity. Now, it is more easy to get the former power than the latter. Hence despotism is natural and suitable to an ignorant people. But as people only become wise by degrees, so the reins of despotism can only be slackened by degrees. The people never

can discreetly use the magisterial power, yet it is necessary for government. Despotism is the magisterial power in excess, with too little popular control—Democracy is popular legislation with too little magisterial power. The latter is one of the greatest defects of the American Republicanism. The half-and-half system of monarchy and popular control combined is the most harmonious in its action, if fairly established. These three systems are all at present starting from one point of time to make an experiment in legislation, for the benefit of posterity—Russia, Prussia, and Austria, upon the magisterial system—America upon the popular system, and England upon the mixed system.

They will each make useful discoveries peculiar to the three different modes of action, for which reason we should be sorry to see either of the three experiments prevented by revolution. But we are morally certain that Providence will give mankind all the advantage of this necessary experience, by preserving the three distinct species of government in powerful action, till one perfect compound is ultimately produced and established as a final and eternal system of political government, combining the power of monarchy, the wisdom of oligarchy and the goodness of democracy. These are the characteristics of the three species of government, according to Blackstone himself, and we think his delineation of each is beautifully correct.

"Three young ladies whose parents lived in the country had been placed in a principal boarding school of Warsaw. In a leisure hour, when walking in the garden, they had sung some patriotic stanzas of a well known Polish air. A spy, who chanced to pass by, overheard the song, and made a report of the occurrence to the police. Immediately *gens-d-armes* were sent with an order to bring the unfortunate girls to the hotel of the Municipality, where, *after flogging*, they were surrendered to the brutality of the *gens-d-armes*. The director who gave that order was Storozenko, a Russian general, who has lately received an estate from the Emperor Nicholas, as a reward of his services, among which, this probably was one. Contrast this with the popular system of America, where the power of the people is so great that the police is almost useless on all occasions of public excitement, where justice is executed by the mob without even the form of a trial, and even the contents of the mail bags ransacked and sacrilegiously torn open and destroyed, to prevent the spreading of an unpopular enthusiasm in favour of negro emancipation. In England, on the contrary, the principal or characteristic crimes are aristocratical. Both king and people are subject to the great landowners, who commit their depredations in the style peculiar to aristocracy, by consultation and legislation. The forms of law being more strictly attended to, there is, however, more liberty of opinion in England than in any other country. Law is the husband of Liberty. Liberty is only Mrs. Law.

A QUERY FOR THE WISE.

SOUND is generally supposed to be conveyed by the undulations of the air, and one argument in favour of this idea is that in a vacuum sound is not produced. But if it be conveyed by the undulations of air, how does it happen that it penetrates glass, which air cannot penetrate. The undulation of sound is as weak and mysterious an attempt to explain its phenomena as to the undulation of light. In fact, no material solution, no theory of matter in motion can ever explain the phenomena of sensation. Science is a weak and stupid thing when it goes beyond the mere vulgarisms of arithmetic, experiment, and observation.

ERRATA.

TO CORRESPONDENTS.

The Gallery of Pantheism is again unavoidably deferred.

THE SHEPHERD.

EDITED BY J. E. SMITH, A.M.

No. 7.]

MARCH 15, 1837.

[Price 2d.

THE PRINCIPLES OF THE SHEPHERD,

MAY be called Pantheism, Universalism, or Catholicism, or by any other word which expresses Universality.

Pantheism implies that every thing, great or small, good or evil, wise or foolish, is the result of the active and conscious operation of the Universal Male (Spirit) in co-operation with the Universal Female (Matter). Consequently, all doctrines, systems, customs, and morals *positively* originate in God and Nature (jointly), and form component parts of a system of progressive training for mankind.

But the only true religion is the acknowledgment of this fact, and the retirement of faith and worship within the true sanctuary of the heart and mind.

BUCKLAND'S BRIDGEWATER TREATISE ON GEOLOGY AND MINERALOGY.

GEOLOGY is now one of the most interesting of all the sciences. It derives this interest principally from its intimate relationship with Natural Theology. All science towers up to God, the primitive source of all the laws of Nature, but Geology embraces the very history of vegetable and animal organization, from their first appearance on earth, to the present point of time, and therefore comprehends a more extensive field of inquiry than even Astronomy itself. It is a sort of universal science, a bible, a revelation in which God makes known the secrets of the past by means of sensible signs, in a language peculiar to himself, but intelligible to man by means of a little patient investigation, without which it is ordained that no positive knowledge can ever be procured.

This work is very beautifully got up, with numerous plates of organic fossils; and a short and concise account of the present state of fossil science is presented to the reader in a theological garb, for the purpose of showing a continued succession of creative acts of omnipotence, with manifold proofs of wisdom and design, not only in the creation of individual species, but in the general adaptation of each species, to the peculiar and successive changes which the surface of the earth has undergone during intervening periods of time. The thing to be proved is a truth, which almost every contemplative mind will take for granted, but there cannot be too many facts adduced to illustrate a subject so pregnant with interest. It is not enough that a mere outline of truth be present in the mind. The outline should be filled up with the richest colouring, and the most judicious mixture of light and shade that we can discover. Truth is susceptible of an infinity of polish. The naked savage has the naked truth of many departments of knowledge in his mind, but it is as rude and uncultivated as the savage himself. Scientific knowledge alone can dress and refine it. Science is the wardrobe of truth. From this boudoir she comes forth arrayed in robes of majestic elegance, and with a demeanour of majestic power. Science is a crown, a sceptre, which confers upon truth the power, and consequently the right to reign, and the greater the number of facts and illustrations that she can command, the richer and the more resistless she becomes.

This treatise of Dr. Buckland is interesting on account of another clerical concession in favour of our interpretation of the Bible. We remember that when we attended theological lectures at College, the professor exerted all his eloquence to prove the *literal* historical truth of the first chapter of Genesis. We thought he

was right; we took the orthodox side of the question. Geology had scarcely then substantiated her claims to credibility, and there was a sad reluctance in the conservative spirit of the church to abandon even the most absurd and ridiculous article of ancestral faith. But since that time, most fearful havoc has been made of the letter of the word. None but the old, the feeble, the ultra pious, the nervous and the ignorant, or the obstinate, have the courage to abide by the old rotten timbers of the faith of their forefathers. Science has convinced the intelligent, and many there be in the church who deserve this epithet, that whatever may be the moral contained in the Mosaic account of the creation, the literal or historical meaning is inaccurate.

The shuffling manner in which the Dr. treats this part of the subject is most unsatisfactory, and, in our opinion, silly. Some of the reviewers have called it ingenious. We see no ingenuity in it, and if it were ingenious, the merit is not due to Dr. Buckland, inasmuch as he has merely employed the hackneyed arguments yearly propounded from every chair of Divinity throughout the country, and that too before the name of Buckland was ever associated with the triumphs of science. The apology for the inaccuracy of Moses is lame and infidel to excess, viz., that God's disclosures of himself are *not intended to convey intellectual, but moral knowledge!* Therefore we are not to be surprised, if God teaches scientific falsehoods, or historical falsehoods, provided he teaches *moral truths*. Was there ever such iniquitous heterodoxy and absurdity uttered? To what does this confession lead, but to a total invalidation of the infallibility of the obvious meaning of the Bible! From a Clergyman too! Dr. Buckland has now fairly committed himself and all the clergy who subscribe to this new article of faith. How will he now prove the truth of the story of the fall of man? of the flood? of the call of Abraham and the deliverance of Israel by Moses? God does not mean to convey intellectual but moral truths by revelation, and an intellectual falsehood may be employed to convey a moral truth, just as Jesus Christ told parables to convey simple elementary instruction to his disciples! We don't say "*nay*" to this, remember.

"The object of the Mosaic account of the creation is not to state in what manner, but by whom the world was created!" So says the doctor, and makes this an excuse for Moses actually stating, and stating erroneously, the manner in which it was created. We say not only that this is a mere assertion on the part of the Doctor, but an assertion that flies so boldly in the face of truth, that any stripling of a school boy must stare at the witness of such a manoeuvre of sophistry. The object of the Mo-

saic account is most decidedly to state the manner, and the order of creation, so far as it was known, or made known to the writer.

But the secret of the whole matter may be that the story is merely a tradition.

This is one way of explaining it to which we have no objection. But allowing it to be revelation, to which we have as little objection (as we have not the slightest doubt of the reality of revelation in all ages), then we say it is decidedly not historical but allegorical and prophetic, and in this latter sense it is susceptible of a very beautiful illustration. Moses does not say how he got his information, and we have no instance on record of a literal historical revelation; that of the Koran is surcharged with hyperbole, and every known specimen of revelation is a masquerade. We have no right to believe the historical truth of a revelation, God himself has cautioned us against it, by declaring it to be a mystery, i. e. a deception until the consummation. "I have multiplied visions, and used similitudes by the ministry of the prophets," he says, but he never says I have recorded historical facts.* It is not the purpose of revelation to record literal facts of any sort. These are left to the ordinary talents of men.

Well! the clergy having abandoned the intellectual truth of the Bible, how do they prove the moral truth of it? We really should like to know how Dr. Buckland has been able to procure this divorce of intellect and morals. From what court did the dispensation come? from Rome or from Oxford? What a melancholy plight this is for Christianity, to be sure! to be separated from the intellect, and sublimated into an ethereal moral spirit, which has no need of science and no connexion with it! We pity the Doctor's ignorance, because we know well that this confession is merely a shift to which he has been reduced to get over a geological stumbling-block, and that he is just as ready as ever to defend the literal meaning of the Apostle Paul's or Peter's words, as if the confession had never escaped his pen.

If the intellectual or literal meaning of the Bible be thus abandoned, and the moral meaning asserted, then we may now inquire what is the moral meaning of hell fire? The literal meaning may be false. We may also inquire what is the moral meaning of a Devil, the literal meaning may be false, and the devil may be a personification of a Divine attribute, as we maintain it to be. What is the moral meaning of the *Son of God*? It may mean mankind personified by an individual, for a temporary theological controversy. What is the moral meaning of his dying for sin? It may mean that sin is only to be got rid of by death, and that God in man (or the *God-man*) is the only author of sin. What is the moral meaning of election? It may mean that in nature there is a necessity for an election or aristocracy to subordinate society. What is the moral meaning of eternal punishments? They may mean that to all eternity man must be influenced in his conduct by the fear of pain as well as by the love of pleasure. The grand hyperbole of hell fire may be merely an intellectual fable, disguising a simple moral truth.

All this we believe. But does the Doctor believe it? No! Even while the walls of ancient Catholicism and Protestantism are crumbling around him—even whilst he himself is committing to paper that it is "*moral, not intellectual truths*," which are conveyed by Revelation, he belies his own principle by upholding the barbarous theology of an unscientific and illiterate age of the world's minority!

Does not all this shuffling of Dr. Buckland demonstrate the truth of the fundamental principle of the theology of the *Shepherd*, that God speaks truth and falsehood in one breath, and makes it the task of man to sift the compound? This we regard as the royal prerogative of Deity. It is an act of wisdom and of goodness on His part to us. The search of truth is *our trade*, as rational beings. We have no right to expect it unveiled by Revelation, and so far from having it disclosed by such superhuman communications, we have always received an additional volume of smoke, and a torrent of mud, whenever we have ap-

plied to Revelation directly for illumination. Hence all those who follow Revelation exclusively, are even more ignorant than those who have rejected its evidence, for naked science will teach a sufficiency of worldly wisdom, to supply the wants of all the ordinary vocations of industry; but Revelation alone has a tendency to beget a contempt for every species of knowledge, except that which was never intended for knowledge, but merely for materials, from which knowledge should hereafter be extracted by human elaboration.

We conclude, therefore, that Revelation (as at present understood) must be reformed. A great revolution must take place. The moral must be extracted by the aid of analogy; and when the butterfly has once come forth, the chrysalis of Catholic and Protestant creeds may then, even without impiety, be trodden under foot.

We solemnly and sincerely repel every charge of infidelity or disrespect towards the Bible and its contents. We believe there is not a Christian in England that has more firm, sober, and well grounded faith in its testimony, than we have. Whatever others may have suspected or affirmed respecting us to the contrary is most unequivocally false. Our faith is no doubt of a peculiar character; but it is a faith which relies with firm assurance upon Biblical testimony, by dissecting that testimony according to the spirit of the rule suggested by Buckland himself, which we would thus express:—"Revelation is a peculiar word of God, purposely disguised in mystery, which creates a vulgar misconception of its meaning, that continues to agitate the mind until truth be elicited by ages of laborious investigation and theological controversy. The principal truth it contains is moral and religious truth. That truth, when elicited, and reconciled to universal science, is a standard truth, to which as much certainty may be attached as to any scientific demonstration; and, moreover, it is a truth which never could have been discovered without Revelation, and the controversies of Theology."

These are our sentiments upon the subject of Biblical science; and the great truths we have extracted from it are:—*The reality of Revelations and Miracles—the immortality of the soul—the two-fold and eternal progression of individual existence—Universal Redemption.*

These are the great truths of natural and revealed religion, in harmony with all the analogies of Geology, which is a type in the material and lower world of what is going on on a more exalted scale in the moral and intellectual world.

The love of God grows up upon a basis of apparent cruelty and oppression, according to the order observed in geological formations, where the lowest, the most fierce, irrational, and cruel of beings take the precedence of those of a more tractable nature, and where the evidence of the most fearful convulsions of Nature is most observable in the primitive ages of the world.

Hell is the foundation of the grand pyramid of being; and, strange to tell, Dr. Buckland, and the most enlightened geologists, seem to be thoroughly convinced of the fact, that the surface of the earth reposes on molten lakes of subterranean fire. So far, therefore, the Hell of Scripture is literal; but this literal Hell is but an analogical figure of the beginning of the providence of God, which commences in the heat or fire of a smart discipline, and gradually refrigerates into a state of mildness and repose.

Nay, all the elements of Nature seem to be playing the same grand concert of universal music. The climate of ancient times was evidently more subject to extremes of heat and cold—storms were more violent—inundations and deluges more frequent—volcanos more dreadful—winds more boisterous—plagues more terrific—all in consonance with the moral and intellectual condition of the earth's inhabitants.

Nature is actually changing, although unchangeable. Her principles are the same; but as her manifestations are different in the different stages of human life, so in the grand career of universal being, whether it be in the creation of animals or in the progressive training of intelligent beings, the same uniform system of progression from worse to better is evident. It is necessary to have an enlightened view of this subject of successive amelioration before we can authoritatively decide upon the truth

* "The Lord hath sworn by his holiness *he will not lie unto David.*" But what of that, if he lies to other men?

or falsehood of certain grand historical records, which now divide the world into conflicting sects. Geology demonstrates to us with unequivocal evidence, that new creations have taken place at repeated intervals—that the “*vis genitiva*,” or generative power of God, has *abruptly* brought into life numerous species of animals which previously had no analogous being—that these new creations were not transmutations of a more ancient species into a modern species, but original productions, of which not even a type or resemblance had before existed. Upon this fact we may easily build the hypothesis of similar acts of creative energy in the intellectual providence of human society. Even did history not disclose to us, with superabundant evidence, the particulars of Divine interference of a marvellous character, in certain stages of the progress of society, we have a right from geological analogy to look for and believe their occurrence; but when the testimony of history is appended to that of science itself, and we are told that, at specified intervals of time, the spiritual agency of God has burst forth in an unusually powerful and overwhelming manner, for the purpose of establishing new faiths, or important spiritual or moral revolutions, we see nothing in this report at all discordant with the revelations of science, but, on the contrary, the resemblance is so manifest that conviction must come home to every reasonable mind, that History has not belied the movements of Providence. What is Judaism but a new geological formation and creation? What is Christianity but another? What is Mahometism but a third? What is the Protestant Reformation but a fourth? and if they are all different in character, it is only so much the more in harmony with the revelations of geological science, which present a distinctive difference, upon a uniform plan of manifold proceeding.

How, now, can Science dispute the whole history of Moses and Christ? We shall quote from the Doctor's volume next Number.

We conclude with the following motto, which we consider so precious that we hope it may be engraved on our tomb stone, as peculiarly expressive of the religion of the *Shepherd*, of Christianity, and the Universe:—

“TO SPEAK TRUTH AND FALSEHOOD TOGETHER, AND MAKE IT THE TASK OF MAN TO SIFT THE COMPOUND, IS THE ROYAL PREROGATIVE OF GOD.”

ON SYNTHESIS.

I ADVISE my readers, before they look at this paper, to make themselves thoroughly masters of my last two articles—(*On the Understanding*, and *On Propositions*)—as, without they perfectly comprehend them, this will be unintelligible.

I request them to call to mind that there were three mental acts requisite before we can form a general conception, viz.—Comparison, Reflection, Abstraction; and that the first of these acts was comparison, on which depended the other two. Thus, in comparing a few individual fruits, though one was greener, another redder than the other, it was observed that there were strong points of resemblance, and hence the whole number were brought under one class, which was called “Apple.” Thus we see one thing was necessary, even before we could compare the individual apples—it was necessary to *have* those individual apples *before us*.

I hope this will be admitted as an axiom, that before a general term, such as “apple,” is known, an individual apple must be known. How would a man first gain acquaintance with a single apple?

“Why, he'll see it to be sure!” cries somebody. Very good; but is his sight enough? “Of course it is.” Stop, stop, friend, it is not enough; you are labouring under a gross delusion. Tell a first-rate artist to paint the exact representation of an apple on a board, and desire your little boy to take it, and eat it. He will dart towards it with joy, but when he has felt the board, he will be disappointed, and tell you it is not a real apple, though it seemed like one.

And what does the little fellow mean? Why he means that though the phenomenon offered to his sight (visual form and colour) was satisfactory, that offered to his touch was different

to what he had experienced in other apples. In other words, he means that unless certain phenomena are offered both to his eye and his touch, he will not acknowledge the presence of an apple.

Well, now, bring a waxen apple, painted in natural colours, and made of the right weight, and offer it to the boy. He sees it, it looks very well, he feels it all right! Is he satisfied now? Stay! What the deuce is he doing? Why he is putting it to his little snub nose, shaking his head, and coolly telling you that it is not a real apple, because it smells like a wax-candle. In other words, it is not enough that certain phenomena be offered to his sight and touch; a certain sensation must be perceived by his nose before he will call what you give him a real apple.

Lastly, shut the waxen model among a box full of apples till it has imbibed the scent. Will the boy now be satisfied? No! directly he has bit it, he will spit it about the floor, and swear you have taken him in. Why, the avaricious little monkey is not pleased until his taste is gratified, besides his eye, touch, and smell. And when all these are gratified, then, and not till then, will he acknowledge that the apple is a real one.

“By George, then, it is no such easy matter to know an apple! We must see it, smell it, touch it, taste it—perform four several acts!” We must, indeed, my dear Sir, though habit and experience enable us to go through these operations in an imperceptible time.

Well, then, an apple is a combination of a certain colour,* form, smell, taste, smoothness, and it is not till we have perceived this combination, that we have perceived an apple.

But we do not perceive all these at once; while the apple is in our mouths we do not see it—that is, the sight is followed by the taste, and yet we have got to perceive that they are combined. Now if, while we were tasting the apple, we clean forgot its form and colour, of course there would be to us no combination. Hence, before we can perceive an apple, we must have the power of bringing to one view the several sensations that compose it.

[Note.—This will seem to some very like the act called “Comparison,” as defined at p. 40. However, I must request my readers not to confuse them. Comparison is the act by which we bring several objects to one view, in order to find out the resemblance between them. By the act mentioned in the last paragraph, the bringing together of smell, taste, &c., we do not try to discover resemblances; no man ever put an apple in his mouth to find if it tasted green. We are not comparing objects, but bringing together several sensations merely to form one object, i. e. the apple.]

This act of bringing together, or putting together, might have the name given it of a “Clap-together,” which is about as pretty a word as “All-Godam.” But, in the same manner as this latter word is Grecized into Pantheism, so do we convert our Clap-together into Synthesis, which is the Greek for a putting together.

Hence a Synthesis of colour, form, &c., is necessary to form the object “apple.”

We will begin with the form, that is what strikes us at first—the first phenomenon exhibited by an apple is a round green or red thing, by a Synthesis the other qualities are added to this.

But here we find we have not been half particular enough; not only is an act of Synthesis requisite to add the smell, taste, &c., to the round thing, but an act of Synthesis is required, to be aware of the presence even of this round thing irrespective of any of the additional qualities.

Attend, good readers, attend with all your might, these matters are no trifles, that are to be understood without attention. And I can assure you, that if they are easy for you to read, they are plaguily difficult for me to write. My attempt to write these things is, I assure you, no small labour, especially, as I go on wholly without precedent.

We will regard now the apple merely as an object of sight, that is known to so small an extent, that the little boy alluded to, could not distinguish the picture, the wax image, and the

* This expression is not incorrect, for though an apple may be red, green, or brown, it is still limited to certain colours, and many would be staggered at the sight of a blue apple.—T.

real apple from each other. I say that even to regard this visual phenomenon as an object, even for this very superficial knowledge, an act of Synthesis is required.

Now suppose a green apple hung up against a white wall, and imagine the following catechism: Look my friend, and tell me what you see. "An apple to be sure." Mind, hands off, you must not touch it, you cannot tell whether it is a real, or an artificial apple. "True, but when I say apple, I now mean either real or artificial, no matter which, I am sure there is something like an apple, and for brevity's sake, I'll call it one." "Very good, as long as we understand one another. By apple, you mean that small, green, round thing?" "I do!" And do you see nothing else? "Yes, I see the white wall." And suppose the apple was on the table, would you see the apple alone, or something else? "I should see the table to be sure." Do you see the apple first, and the wall afterwards, or both together? "Both together." Did you ever see an apple quite alone, or always something together with it? "Always something with it, the plate, or the table or whatever it stands on." Did you ever see the form of anything, itself being alone? "I think I have." Stay, what constitutes form, what makes one form different from another. Wherein does a square differ from a triangle? "One is bounded by four lines, the other by three." Good, and if you could not see the boundary lines, could you tell the shape of the figure? "No." And if the boundary lines were precisely the same colour, as the space bounded, could you see them? "No." Therefore to perceive form, it is necessary not only to see the space bounded, but also its boundaries. "True." Hence then it is impossible to see any form by itself alone? "I perceive such is the case."

I have pursued this catechetical form in order to put the conclusion in a stronger light. Indeed I have often thought of writing in the dialogue form, instead of any other. One is able to propose objections to one's self, and to answer them in the most striking manner. Plato always, Berkeley generally, wrote in dialogues.

This, however, is the conclusion that our sight does not exhibit to us any thing alone. Our mere eyes would never inform us of one apple, nor one anything else. There lie apple and wall as it were, in a sheet before us, there must be some act on our part before we consider the apple alone.

Look at a connoisseur standing before a portrait. It has perhaps many defects, and the face alone is beautiful, sufficiently so to make him forget the accompanying faults. He does not see them. What do we mean by this? If the picture be a small one, he can surely take it in all at once, and his eyes are wide open. What do we mean when we say "he does not see the defects?" We do not literally mean "see," but we mean, that although the whole picture is before him, he THINKS of the beauties alone. Thus, though a whole is offered to him by thought, he is enabled to shut out all that he does not want to consider.

And it is this act of thought which is required to constitute a *one*. A vast plane is set before our eyes, depicted in various colours, it is by thought alone that we select this or that space of color, or of different colors, and regard them as *one* object.

My own unity lies at the basis of this. I am one person which means no more than that representations which are brought to my mind together are combined; otherwise I should be many persons instead of one. This is a truism, but must yet be brought forward as an elucidation of the foregoing. To say that things become objects, means that the "I think" accompanies them, and this implies that they are, as it were, bound into one. How Synthesis is required for a mere visual phenomenon will be explained in my next paper.

I think the above quite enough to digest for a fortnight.

N.B.—Though I talk about Synthesis, I am not Tom Wirmann, nor do I read his tri-colored books.

THE TRANSCENDENTALIST.

MORALITY NOT DEPENDENT ON RELIGION.

SOME persons confound morality with religion, and suppose that to be identical; but this is a great error. We know that what is called religion often exists in opposition to morality—to

what conduces to the happiness of our species. The *Thugs* of India strangle their fellow-creatures from a pious and devotional motive, in obedience to the rules prescribed by their god-dess. On the other hand, pure morality is often found among men who follow no form of religion. We think, therefore, the term religion should be understood to express man's ideas of his relation or his duties to his divinity; and the term morality should be confined to express what he conceives to be his relation and duties to his fellow-men.

The standard of morality, like that of religion, is different in every country, and ever varying in the same country. Nevertheless, the practical rule of morals, "*Do unto others as ye would be done by,*" seems to have been acknowledged intuitively by all men from the earliest times. Before Christ came the commandment, "Love thy neighbour as thyself," was a social proverb.

Among the heathen the sentiment is universal. In the ethics of one of the most ancient nations of the world (the Chinese), we find this precept—"To act towards other creatures as to one's self, is benevolence; to judge of others by one's self, will induce a mild judgment"; also, "Excuse others as you would yourself; reprove yourself as you would reprove others." Again, "The cause of thousands and myriads of moral ills to man is simply *selfishness*; hence hundreds of disputes. Each desires only that he himself may be rich; desires only that he himself may enjoy repose; desires only that he himself may be long-lived." "If a man can take a human body, and place it, under universal circumstances, in the midst of heaven, earth, and all creatures, and view it as he does all the rest; then there will be no impediment to whatever he may do. But the moral prince alone understands this—the petty man does not. The petty man is accustomed to love his own convenience and advantage, regardless of the inconvenience or injury that others may suffer. He invades the things of others to make them his own; by fraud he obtains men's property to make it his own. Now, that which one dislikes done to one's self—not to do it to others—this is the work of fidelity and forbearance: this is the rule for him who desires to be virtuous."

No one can deny the goodness of the moral doctrines inculcated in these sentences; nor can any one doubt that the practice of them will be pleasing to a just God. "But this is not religion," says the Christian priest. "Morality is not the Gospel. Something more is required of man to make him acceptable with God—something more than the duties of social life—more even than repentance and reformation. Man can only be saved through the blood of Christ." So, unless the poor heathen can be brought to prostrate himself before the Moloch these bigots have set up—unless he can bring himself to the conviction that God had no other way of saving man from everlasting torments but by gibbetting his only son on the Cross, he must be damned!

Yet, all the while, the Scriptures, which these Christian bigots profess to expound, say: "Glory, honour, and peace to every man that worketh good—to the Jew first, and also to the Gentile." "So, after all, men who do not acknowledge Christianity, may be saved."

We were led into the above remarks on reading, in the *Evangelical Magazine* of this month, a rabid missionary address to the Americans, in behalf of the spiritual wants of the Chinese. "There never was a time like the present," says the address, "when such intense interest was felt in the *eternal welfare* of China and the adjacent countries." "These kingdoms seem to have been peculiarly fortified against the entrance of the Gospel by the *Prince of Darkness*!" "It will be necessary that a considerable number of pious and talented students be educated purposely for the Chinese missions, either in a separate, or one of the best American colleges. For these countries we need the spirit of martyrs in the labourers. They must work and suffer, and thus overcome Satan! No success on a large scale can be expected, unless the missionaries be animated by this spirit." "We therefore expect them here, full of zeal and Christian courage. We wish to see them soon; and never desire to look upon the day when any of them wishes to retreat."

"We must conquer or die!" "We trust that both Bible and Tract Societies will support the cause largely. There are in our parish about four hundred millions of immortal beings, to supply whom *enormous funds will be needed!* We are persuaded that whenever we shall seriously go to work, *Satan will make a dreadful stir!* Some will be thrown into prisons, and beheaded, as in times of yore. But, then, the Saviour *has overcome* the arch-fiend, and whatever we suffer for his name will redound to his glory, and the *propagation of the Gospel.*"

What nonsense is this! The Chinese are no more likely to turn Christians than we are to turn Buddhists; besides, what would Christianity do for them? Many writers, who have had an opportunity of judging of the characters of the Chinese, say, they are the most moral and orderly people, perhaps, on the face of the earth. But God, for wise ends, no doubt, has sent these missionaries "a strong delusion," and their itinerancy will, in the end, prove a benefit to society, if it be only in the way of languages and geography, the knowledge of both of which has already been greatly extended by their efforts.

But greater good than even this will accrue by the social interchange of sentiments between two great and original races of men—the Stationary and the Progressive, the Conservative and the Revolutionary. The Pantheism of the East will impregnate the bigotry of the West, and the science and revelation of the West will correct and illuminate the imperfectly developed Universalism of the East.

GALLERY OF PANTHEISM.

BENEDICT SPINOZA.

No. I.

[The importance of the subject has determined the writer to divide his essay into three parts. In the first he gives a brief sketch of Spinoza's biography; in the second an outline of his doctrine; in the third he will endeavour to give his own opinion upon the merits and defects of the philosophical, religious and moral tenets of the acute and bold metaphysician.]

SPINOZA, one of the greatest among the philosophers, of all ages and countries, was born at Amsterdam, 1632. His parents were Portuguese merchants, of Jewish persuasion, and gave him the name of Baruch. He received a good education, and from his childhood, distinguished himself for his ardent love of knowledge.

His fondness for study was at first a cause of disappointment for his parents, who wished him to be trained for the acquisition of wealth. But the talents of young Baruch soon threw overboard the stamp which his tutors wished to impose upon the development of his natural faculties. His parents seeing that wealth was not the object of his desires, thought to turn at least his love of science to some lucrative purpose. They fancied to make of him a servant to the altar, in order that he might live from or by the altar.

But in this instance, also, were the efforts of his parents defeated. Baruch's organs of causality, ideality, comparison, &c., were larger than those of acquisitiveness. In reading the Bible in the original language, he found several points, which did not stand the touch-stone of his reasoning powers. The Talmud and the Rabbinical philosophers did not afford to his mind a greater satisfaction. Though very cautious and modest, some of his youthful companions had elicited from his lips the secret thoughts of his mind, and betrayed him to the superstitious zeal of priestcraft. He was challenged to appear before the Synagogue, where he was accused of professing ideas contrary to those taught by his teachers—ideas contrary to all religion. Spinoza, instead of degrading himself by a contradiction of his opinions, publicly acknowledged them, and challenged his accusers to prove him in error.

The assembly broke up in uproar, and Spinoza left the Synagogue, and from that moment he dropped the name of Baruch and assumed that of Benedict. From this time he dropped also the Bible and the Talmud, and devoted himself to the study of natural philosophy and metaphysics. In order to be able to

read the philosophical works in the original, he studied the Latin tongue under Dr. Van der Ende, an able physician, and classical scholar.

Van der Ende had received him as an inmate into his house, and here Benedict learned, together with the Latin tongue, the first chapters of the Art of Love. The Doctor had a very accomplished daughter—a sort of a blue stocking, versed in the Latin literature, music, &c., and though not very handsome, she possessed fascinating charms. When the father was obliged to go abroad to see his patients, the young lady was in the habit of taking her father's pupils under her tuition.

She must have performed her parts admirably, for two of them fell desperately in love with her. The one was our Spinoza, the other a Mr. Kerkering, the son of a Lutheran gentleman of Hamburg. The fair scholar balanced between the respective merits of the two lovers, but at length the gift of a rich pearl necklace caused her to give the preference to the German suitor, who afterwards abjured the Lutheran faith, returned to the bosom of the Catholic church, and became her lawful husband.

Poor Benedict was so chagrined at thus being defeated by his rival, that, though he bore his destiny with philosophical calmness, yet he forswore for ever to marry.

Scarcely had he recovered from the grief he had experienced, on account of disappointed love, when he was assailed in the street by some bigoted friend, armed with a stiletto, from whom he received a cut in the face. Shortly after he was formally excommunicated by the Jews. Some of the biographers have preserved this remarkable act of human folly and intolerance.

Since the laws of excommunication among the Jews take away from the condemned all claims upon his family, Benedict was obliged to learn a mechanical art, by the exercise of which he might be enabled to support himself, and to indulge in his favourite studies. This view of wisdom he had learned among the Jews, who teach that he who does not teach his children some manual profession, opens to them the way to become thieves and highwaymen.

He applied himself to optical mechanics, and became therein so proficient, that he would have made his fortune by it, if gain had ever been the sole object of his labours; but he worked only for his mere subsistence, and devoted most of his time to meditation and study. In his habits he was moderate, both equally distant from cynicism and pedantry—his conversation was agreeable and instructive—his temper amiable and benevolent—his heart and purse open to all whom he knew in need.

Though excommunicated and persecuted by the Jews, he never revenged himself against them; nor did he, in order to vex them, join any Christian sect. However, he was of too noble a mind to refuse to acknowledge that Christ was the pattern of the development of the Divine principle in man—the symbol of the perfectibility of the human species.

In order to avoid the petty quarrels with the modern pharisees, who accused him, before the Christian magistrates, of teaching doctrines contrary to all religions, he retired into the country, and went at length to establish himself *à la Haye*, where he remained all his life time.

In the beginning of his philosophical career he was a disciple of Descartes, the tenets of whom he explained in two Latin works, *Principia Philosophica*, and *Cogitata Metaphysica*, both of which contain the germs of his own system. Yet these works did not call upon him the attention of the public. The work which drew upon him the anathemas of the Sectarians of all creeds, and revealed his original genius, was the *Tractatus Theologico Politicus*—the boldest attack upon positive religion that ever issued from the pen of man, and which has furnished materials to all modern philosophers, who have come forth to attack the vulgar conception of immediate revelation.

We shall give extracts of his works in our next Number.

Many were the writers who arose against the philosopher, whose name was pronounced with horror and malediction; but that did not prevent him from pursuing fearlessly his researches after truth.

In spite of the terrible anathemas pronounced against him by Jews, Gentiles, and Christians, several of the most eminent men of England, Holland, Germany, and France, courted his

acquaintance, and became his disciples. Indeed his reputation grew to such a degree of eminence, that he received the offer of a professorship of philosophy at the University of Heidelberg, *cum ampla libertate Philosophandi*, with the most ample freedom of seeking after truth. This offer he rejected, he knew that he who becomes indebted for his living to the liberality of princes, soon loses the energy which is necessary to a true philosopher. He accepted, however, the half of an annuity, which was left him by a friend, renouncing the other half to the legitimate heirs of the testator. The next work which he published was his *Ethics*, and it is particularly this work which shall form the subject of our inquiries. It is here that Spinoza has laid down a system of Pantheism, which, in regard of logical correctness, perspicuity, and consistency, is regarded by all those who are able to judge on these matters the greatest masterpiece of human ingenuity. When it first appeared the philosophers were struck with amazement; several tried to confute him, but in vain; their blows touched mere shadows; the giant stood unvanquished. Not being able to cope with him, both divines and philosophers began to calumniate him, and such was the effect of the prejudices spread abroad by his incompetent, but numerous and powerful adversaries, that though his name figured conspicuously in the list which dolts and knaves drew of the pretended atheists of all ages, his works, and particularly his *Ethics*, fell into oblivion, and could scarcely be met with at any library in Europe. The few philosophers who got hold of it pillaged his ideas, and introduced them in their works as their own.

Even in regard to Spinoza, we owe to the Germans, that this great philosopher has been rescued from the stigma of stupid Atheism, and that his works have been rendered accessible to the public.

The most remarkable men who have contributed to this work of justice are, Lessing, Mendelssohn, Jacobi, Göethe, Ast, Hedereich, and Schelling.

A professor of Divinity of Heidelberg, Dr. Paulus, has collected all the writings of Spinoza, and published them in two volumes, some of which have been translated into the German. Those who do not understand metaphysics, think the speculations of the philosopher are of no use to public life. That is, however, the reverse. Philosophy and theology are of the greatest influence upon the actions of whole nations. Napoleon dreaded the influence of German Idealism as much as the swords of Blücher and Wellington, and the Holy Alliance has been so well convinced of this power, that they have destituted or persecuted all the professors or disciples of the Idealists.

The metaphysician, Spinoza, was also a political innovator, he showed the vices of the monarchical and aristocratical constitutions, and taught how to establish democracy upon solid principles in his *Tractatus Politicus*. Perhaps this is also a cause of the spleen of the numerous adversaries of Spinoza.

His letters, addressed to several learned men of his time, bear witness of the amiableness of his character, and of the stern love of truth that animated his endeavours.

He died at the Hague, in the year 1677, after a short illness, without fear of death, and in the hope of a future life.

HERMES.

PEGSWORTH, THE MURDERER.

PEGSWORTH died a penitent, and like the thief on the cross, he obtained his passport to heaven by the confession of the sinship and power of Christ. We give the ordinary who attended him ample credit for the zeal with which he strove to save the soul of the murderer from the justice of God. But the worthy parson takes no merit to himself; he only did his duty in fishing for souls, to people the heavenly mansions of Christ; and it is entirely to the grace of God, communicated to the culprit's soul, that the benign work of conversion is to be attributed. Happy Pegsworth! what a sudden change it must have been to thee to step from the scaffold of ignominy, from the very cursed death of the cross, to the threshold of Paradise!

But why should the parson attempt to save Pegsworth, or any other murderer, more than any ordinary money-raker of the city at his final exit? Was Pegsworth in reality more obnoxious to Divine wrath than an English Bishop, who caricatures the

meekness and mortification of his master, by an affected show of humility, amid the pomp and luxuries of a palace? Murder is merely condemned as a crime against society, in the Bible, but the love of the world and its vanities is condemned and railed at in long detail with a rich variety of strong and impressive illustration. We are all in a state of condemnation by nature; from our mother's womb we are cursed by the God of this world, who has begotten us in the shades of eternal evil, and leads us through the labyrinths of wickedness by an infinite variety of illusive snares and powerful deceptions, by which he convinces us that evil is good and good is evil. But no man has any right, from Scripture or reason, to declare that a murderer under sentence of death is more in danger of hell fire than a stock-broker on Exchange, or a rector in his pulpit. True, the Bible says that there are no murderers in heaven, nor adulterers, nor liars, nor covetous men. But this has nothing to do with the subject. Pegsworth is not a murderer now. The murderer is gone to his eternal doom. The spirit that escapes is not a murderer, and any stain of wickedness which defiled it in the body is washed in the blood of the first life. Every spirit is sinless. The law is given for this life, and it hath dominion over a man as long as this life continueth, but no longer—(Romans vii. 1.) There is no condemnation to the spirit, but merely to the flesh. It is the flesh and blood which is excluded from the kingdom of heaven. The appetites and passions connected with them have also the curse of exclusion upon them, but that the spirit of any man is personally excluded, we challenge any divine in Christendom to demonstrate from the Bible.

We do not write these words in condemnation of the ordinary's zeal in working up the latent feelings of religious hope in the murderer's soul; far from it; it was a blessing to poor Pegsworth to be thus mentally excited by the allurements of pious emotions. Our purpose is to point out the absurdity and even the Christian heresy of supposing that, by this means, a soul is saved from the jaws of hell, or, in other words, of Divine vengeance. "All go into one place, to the place from whence the rivers come, thither they return again," said the King of Israel. This is the doctrine of common sense and of natural religion, and is the concealed doctrine of Christianity. Still there may, and no doubt must be, gradations of rank and being in the world to come, as well as in that which now is, and these gradations may be more or less connected with the state of the soul at the period of dissolution. Thus far we will go, with any divine, but no farther; and if it be urged against us that this is a dangerous doctrine to teach, we reply, it is less dangerous than the doctrine of the church, which sends a murderer white-washed to heaven, for making a few wry faces and pious lamentations before he mounts the scaffold. It is less immoral than the doctrine of the church, which actually removes the horror and deformity of crime by the appearance of partiality in the judge; for what can be more conducive to an immoral life than for a judge to say, "You are a grand scoundrel, Sir, but because you have acknowledged the legitimacy and heirship of my dear son, I will forgive all your sins: without this acknowledgment your fate would have been a fearful one." But the Scriptures say, "the Lord has made all things for himself, yea, even the wicked in the day of evil."—(Prov. xvi. 4.)—So say we.

The common chant of piety, which is taught and sung by the church and its disciples, has no more connexion with genuine piety than the song of "Jim Crow," or the death song of an Indian, has with a taste for music. It is a sort of infection which changes with the spirit and character of the age, and depends for its development upon the prevailing creed or chant of the country. A Catholic holds up a crucifix in his last moments—a Protestant dispenses with this crucifix, and imagines Christ in his mind. Christ, however, is only an image of God after all—(2. Cor. iv. 4) Both are idolaters, whose performances vary with the times and countries of the respective performers; but the love and mercy of God are universal ideas which never change. To these true piety ascends directly, and reposes in tranquillity upon them. Surely it is high time now that these crucifixes were removed, and the real substance substituted in the room of the types and shadows—that the true Christ were enthroned in the mind and the false Christ banished from

the deluded imagination; for it is really necessary, as Jesus told his disciples that Christ the man should *go away*—that Christ, the spirit and comforter, should reign in his stead. What has the cross and the man effected any more than the Catholic crucifix?

CURIOUS SPECIMEN OF THE WISDOM OF OUR ANCESTORS.

The following extracts are taken from a work, called the *World's Doom*, by Stephen Batman, professor of divinity, and dedicated to the Lord Chancellor of England, Sir Thomas Bromeley, in the reign of Queen Elizabeth.—Printed 1581, curious and rare:—

"In certain places of Arabia are these monsters. They have three eyes, a nose, and a great mouth, two very large and round ears, every arm hath two hands; the males also have two such great breasts that they cannot well cover them, they wear beasts' skins, they go without any hose and shoes, neither have they any toes on their feet. They are called Sterlocks." * * *

"In the parts of Ethiopia there are men well proportioned, saying that they have but one leg with a very great foot, with the shadow whereof, when the sun cometh to the south, they lying upon the ground save themselves from the heat; when they should walk they leap, neither can they do otherwise, they speak as we do in their tongue, they are very good jewellers, and sell their jewels to the merchants of Arabia, receiving of them corn to live by. They are men of great strength, and live two hundred years. Their women are very fair, and common to every one."

"In the parts of Ethiopia towards the south, such are found which have a goodly body of a man, two arms, two thighs, and men's feet, but on their shoulders they have a dog's head standing out, they lend a man's life, and work cunningly divers things with threads of silk and gold, which they send to the great Cane. They laugh not nor weep; they exercise great merchandize of margarites or pearls of carbuncles and other goodly stones. Their King is tributary to the great Cane, and the tribute is paid with things of silk and gold."

"In the East Ocean such gross women be found. They are long necked, and against nature, they have their arms joined to their thighs, they have also legs, but feet of another form, they are higher before than behind, and have the tail of an ass. They go out once with four children, two of which they kill, the others they bring up. They have great store of milk, whereof they make cheese to live by. The males be like the females, but be less in their belly and breasts."

"In the isle of Taprobance such human creatures are found misshapen. They have short thighs, high shoulders, a slender neck, a very great head, with one eye alone in the forehead. They seek for pearl, and the like goodly things; they are cruel and savage people, neither can a man know the female from the male but when they are great with child. They go naked, and live by wild fruits, dew is their drink, they want ears, yet is their hearing sharp, a kind of hornet do much trouble them, for which they hide themselves into the sand until the hornets fly by them to other islands."

"In the deserts of Lybia there are found women which have breasts hanging down to their knees, they lack the use of speaking, but yet they cry or shriek vehemently; they live at home with men, they run swiftly, so that they can take wild beasts in running, which they eat. They are between white and black, to wit, of a russet colour. They want hairs, saying that, from their knees down, they are like Satyrs, cloven footed as a cow or bull. They are strong and quickly, hold fast that they take, their head is thick of hair. They are misshapen in body and face. They laugh willingly, especially in the presence of men."

"In the Alps of Africk are found these monstrous creatures. They are altogether of a brown yellow colour, having a man's face in their breasts, thighs like an ox, feet like a man, tail like a fox, udders like a goat, a back like a camel, a long neck, and on the top thereof a round bunch, with two pigs ears, they have a beard like a goat, they live by herbs and roots, and are very wild. While they are little, men use to eat them, which the

great men in authority do use, but when they are old they are hard of digestion. They are better than goats with us."

Batman was one of the pious founders of the English Protestant Church, an ordained clergyman, and a trainer of youth for the work of the ministry. Some may smile at his simplicity and ignorance, but much greater is the ignorance of those who are most disposed to ridicule and revile such a man, inasmuch as they cannot give a *reason* for asserting that his testimony is false. What necessity is there in Nature for making animals in their present shape and character? Why might not chemical action produce three eyes as well as two, feet without as well as with toes, or dogs heads on men's shoulders as well as upon dogs shoulders? The reason why God would not, is a MORAL REASON, but there is no moral reason in chemical action, and we challenge any man to give a *scientific* reason for the non existence of such animals. The *moral fitness* of things does not, properly speaking, belong to science, but to natural theology, which is the master of science, and the universal school of truth.

MISSIONARY PREACHING.

It is rare that we meet with a good specimen of Missionary preaching, but we believe our readers will agree with us that the following is not to be despised. It is taken from the New York *Observer* of the 21st of January, in a speech of the Rev. H. Wilson, Missionary.

"I went, in company with three or four brethren, to preach at the town of the Osages. At the first village we approached, we met a large company returning from a victorious expedition against the Pawnees; they were intoxicated with success; they had destroyed a town, and brought off six hundred scalps, together with a bag full of scalps of white men, (supposed to belong to a party of Indian trappers who were missing,) of which they had plundered the Pawnees. As the Indians have the impression that the missionaries have some authority, as if they were agents of the U. S. Government, they will listen to us when we preach, with apparent respect. Several addresses were made to them; and as may be supposed, against war. This I soon found was unpalatable doctrine. Their ears were closed and their heads turned away impatiently. No effect seemed to be produced, and the assembly was dismissed. The Indians then prepared to hold a grand scalp dance; this is a religious ceremony, in honour of the God of war. The scalps were hung aloft on a pole, and a large fire being kindled, they danced around it, to the sound of rough music, till midnight. The missionaries went to the lodge prepared for them to sleep; but I could not rest. Finding an interpreter, I returned to the revel, and taking advantage of a pause in their dancing, I lifted up my voice, so as to be heard by them all, and exclaimed, 'I am for war! I want to make a war party.' (Here was a great shout.) 'I am going to make a war talk.' (Again they shouted, when alluding to their customs.) I proceeded: 'My text, or starting point, I will take from the good book.' Here again they shouted, as if rejoicing that a missionary and the good book were in favour of war; and they then pressed close around me, listening with breathless attention. I proceeded, and announced my text, 'Fight the good fight of faith.' After which I gave them a discourse, of which the following is an outline:—I. 'Who is the leader in this war? Not *Mad Buffalo*, nor other chiefs whom I named; but the Lord Jesus Christ.' 'And who was he?' burst from a thousand lips. Here I described the character and work of the Lord Jesus. II. 'Who are the enemies? Not the Pawnees; not the Camanches, &c. But their sins; Satan; their wicked hearts.' Here I embraced the opportunity to describe their spiritual enemies. III. 'What are the weapons of this warfare? Not the tomahawk; not the scalping knife; nor the bow and arrow. But the Bible, prayer, &c.' Here I described the weapons of spiritual warfare. IV. 'What is the victory for which we fight? Not to enjoy the scalp dance, &c. but eternal life.' And here I spoke of the nature of heaven, as a holy and spiritual place. I sought, in this manner, to preach the gospel to their conceptions; and for four hours, during which this scene continued, they forgot their amusement, and manifested not the least sign of impatience."

During this 'talk,' some of the shrewdest questions were put to me, denoting that I had to deal with quick and penetrating minds. While describing this crucifixion, I was interrupted by a chief with the question, 'Who killed this good Saviour? Was it the Osages?' 'No.' 'The Pawnees?' 'No'—&c. 'Then it was done by white men! Ah! brother, see; white men are worse than Indians. Indians kill their enemies when they come to burn and destroy their wives and children, but not their friends. But the white men killed their great friend. No Indian would kill such a good and kind being as you say Christ was.'"

The effects described by this missionary produced upon the different Indians by the preaching of the Gospel, even allowing for a little amplification, are very gratifying to the philanthropic mind. The principal effect is that of the entire cessation of war, and all its barbarous accompaniments, amongst those who have embraced the new faith, which, with all its imperfections in the civilized world, is evidently a wide step of advancement beyond the savage state. The Christian zeal, however, of American savages may well put to blush the lukewarmness, the frost, and the knavery of the *white man's* Christianity.

"I attended the anniversary of the Cherokee Bible Society, which was held at the close of a protracted meeting. The president, a grey-headed Indian, first led in prayer; then directed the minutes to be read, and called on several persons for addresses, after which subscribers were requested to pay their contributions. I was deliberating whether to give fifty cents or a dollar, which I supposed was about enough for a poor missionary. I was near the standard of many benevolent societies among white people; but I was ashamed, when I saw these poor people come forward and contribute some two, some three, four, five, or six dollars. Among them was a poor woman, aged eighty years, who had subscribed two dollars some months before, when she had not a cent in hand. In order to procure money, she cultivated a little spot with her own hands, and raised a small crop of corn, and reserved as much as she would sell to pay her subscription. A drover coming along, she sold him the corn for two silver dollars. *He was a white man, and a Christian*, she supposed; but when she came forward to lay down the money, lo! it was discovered that the coin was counterfeit."

These new savage converts are tremendous pray-ers. From the Octogenarian to the boy of fifteen, they are all capable of taking the lead at a prayer meeting. Ought not this to make the white man's cheeks turn copper-coloured with pure shame? We hope that these missionary reports may prove literally true, but we cannot help observing that the quickest method of ameliorating the condition of the Indians would be to teach them agriculture and the mechanical arts, as the basis of civilization. To the neglect of this we attribute the general failure of Protestant missions. We believe, with Dr. Wiseman, that the "Holy Mother Church" is the most accomplished adept in missionary tactics.

MORE SPECIMENS OF THE "TRADE."

In our last publication we brought forward a few advertisements from the *Evangelical Magazine* for February, in order to show that godliness was really a marketable article among the pious Evangelists. Some of these were rich specimens; but in the present month's Magazine we have even richer. For instance: "Wanted, by a respectable widow, a situation to attend an invalid lady or gentleman, or as housekeeper, &c.—*The advertiser is one who lives in the fear of the Lord!*" There's a recommendation for you! And what a contrast is this advertisement to one which we saw in the *Morning Chronicle*, a few weeks ago, which announced that "A lady, whose husband is gone to sea, feels herself dull, and wishes for a gentleman to lodge with her. Apply, &c." Yet, probably, there might not be so much real difference in the views and characters of the two parties as appears on the faces of their respective appeals to the public. Godliness and virtue are as often apart as conjoined.

The next we have marked is that of a stationer, who wants

a decidedly pious young man as an assistant—a "Conservative Dissenter." What's a Conservative Dissenter?

A coach-maker wants an apprentice. His family is one of *decided piety*, and, he says, the greatest attention will be paid to the youth's moral as well as commercial interests.—That is quite right.

A clothier wants a sharp, active youth, whose morals will be carefully attended to; and he will have the privilege of hearing the Gospel every Lord's day.—A sort of privilege which many young men think very highly of.

A draper wants a pious young man of good address.—Aye, piety alone will not do for a man-milliner.

A wine and spirit merchant wants a pious young man as clerk, and a serious man as a cellarman—one who has a thorough knowledge of his business: and that is, we guess, one who knows how to water the rum, and then go up stairs to prayers!

TO CORRESPONDENTS AND READERS.

We have received Mr. M.'s letter and lecture on the materiality of the Deity. We have not the slightest objection to the doctrine of God's materiality. In fact, there is nothing material but God, who is the very basis or substratum of matter. But we are equally in love with the spirituality of God, because we know it to be impossible to distinguish between the two modes of being. Spirit and matter are one, but double only in respect to modality or manner of existence. We differ decidedly, however, from Mr. Meikle, in his giving the preference to the word matter, as the primary mode of existence. The primary is the most ethereal, mental, mobile, and active mode of existence, which most assuredly is spirit. Electricity we call spirit; light, heat, galvanism, attraction, repulsion, are all spiritual agencies, and if they act only through and by certain modes of material existence, this only proves the relationship which subsists between spiritual action and material combinations. The atmosphere is more powerful than the water, and the water than the solid earth. Light and heat and electricity are more powerful than air—the farther you remove from solidity, the greater is the power which you perceive. Analogy, therefore, teaches us to give power to the spiritual in preference to the material aspect of nature. But if it be replied "we cannot form an idea of spirit," we reply, "we cannot form an idea of matter." Let our correspondent read the first letter of the Transcendentalist (No 5 of the Shepherd), and he will see this distinctly proved. Our ideas of matter and spirit, therefore, being equally indefinite, we do not see what right any man has to substitute materiality for spirituality in the Deity. It is only another species of superstition. Our Correspondent also thinks that by means of this materiality he will get rid of mysteries, oracles, revelations, &c. How this will follow, we do not understand, unless he means to make his material God an unconscious power. If so, he is an Atheist of the most deadly sort, and there is no use in reasoning with him. Yet even an Atheist ought to acknowledge the possibility of oracles and revelations; for, if electricity or dead matter can make men, women, and children, and make them speak, think, and act, we think it is not incapable of making prophets and apostles, witches and wizards. Atheism will not destroy superstition; it will only make it more wild and ridiculous. We could invent a system of Atheistical superstition as full of charms and incantations as an egg is full of meat; indeed, Superstition is more allied to Atheism than to any species of religion, except Fetichism and the worship of Genii. Now the existence of Genii is not inconsistent with Atheism, and if you give us Genii to begin with, we shall travel at railway speed in our career of superstitious faith. Our Correspondent, like all his class, seems to be ignorant of this singular fact, that superstitious people are seldom religious people: the most sublime specimens of superstition we have ever met with are among those who never enter a place of worship. Perhaps this is a new idea to our Correspondent—let him put it to the test. The alliance between Atheism and Superstition is closer than he is aware of. There is nothing so effectual for destroying superstition as a faith in one infinite, eternal, and all-comprehending Deity.

THE SHEPHERD.

EDITED BY J. E. SMITH, A.M.

No. 8.]

MARCH 31, 1837.

[Price 2d.]

THE PRINCIPLES OF THE SHEPHERD,

MAY be called Pantheism, Universalism, or Catholicism, or by any other word which expresses Universality.

Pantheism implies that every thing, great or small, good or evil, wise or foolish, is the result of the active and conscious operation of the Universal Male (Spirit) in co-operation with the Universal Female (Matter). Consequently, all doctrines, systems, customs, and morals *positively* originate in God and Nature (jointly), and form component parts of a system of progressive training for mankind.

But the only true religion is the acknowledgment of this fact, and the retirement of faith and worship within the true sanctuary of the heart and mind.

POLITICS.

This is an age of political fanaticism, and it will end in political delusion. Symptoms of a downfall are already numerous. There must be a retreat to first principles, which are not yet settled. The people are wasting their strength upon various questions of local and partial interest which, when solved and answered according to their hearts content, will only be pulling them out of one horse-pond, to duck them in another.

Justice! the people want justice! what sort of justice do they want? Natural or unnatural? If they want natural justice, there is nothing more natural than that which they have got, which is the effect of their own moral and intellectual condition. If they want unnatural, where can they procure it?

On the 31st of March, ult., we were passing the Bolt in Tun, in Fleet-street, and sniffed up a strong scent of spirits, which impregnated the atmosphere; we observed a crowd of men and women immediately before the coach office. We suspected the cause, and boring our way into the *social* party we discovered a working man in decent attire, on his knees, sucking up with a straw from the gutter, the spirits which had been spilt by the bursting of a cask! A patriot no doubt! an enemy of corruption doubtless! A liberal without doubt! Others were standing around waiting their turn, and quarrelling for the precedence! all citizens of course, claiming the rights of legislative representation!

And yet we are advocates for universal suffrage. But we should go the right way to work, by preparing the people for that privilege. We should put the horse before the cart, not the cart before the horse.

True politics are as simple as true religion. But false politics are a mystery, which the devil only can comprehend. Agitation may be a very useful thing, but it is merely the howling of wolves after all. The American Republicans are crying for cheap bread, and exclaiming against their tyrants, whilst our Radicals are longing to be as happy as their transatlantic brethren. Is America, nearer the beau ideal of a good government than Britain? not a whit; the road to America is not the road to happiness.

Where then is the road to happiness? Knowledge? No! Knowledge is of little use, if by knowledge, you mean that sort of blarney called phrenology, chemistry, hydrostatics, &c. The first principles of Religion and morals, are all that it behoves the people to know. As long as these are unfixed there is nothing but desolation in reserve for human society.

These first principles ought to be subjects of intense inquiry, in order that we may be able to express ourselves so as to be understood. People talk of justice and equality; what do they mean? Is there such a thing in nature, as either, in their sense of the terms? Do they exist in the mineral, the vegetable, or animal kingdoms, or in the solar system? Are all the planets equally large, or equally brilliant? Are all climates equally salubrious, all soils equally fruitful; all women equally fair, and all men equally powerful?

There is a want of sound philosophy at the bottom of all the gibberish of politics, which must compel the public mind very soon to fall back upon the metaphysical department of thought, in order to enable it to proceed with effect. The language is so stupidly indefinite, that it is the easiest thing in the world, to overturn almost any doctrine, merely by a sophism. Metaphysics are to all practical philosophy and political economy what the earth is to the foundation stone, the true foundation. *Facts*, only become a good foundation, when they have a good foundation to rest upon. If you lay your facts in the sand they will soon be washed away. There are two foundations both for houses, and for philosophies; they are useless alone. The ancients used the metaphysics without the facts, and the moderns, the facts without the metaphysics. Fools must be taught by experience.

Our own beau ideal of government, is uncommonly simple, it is merely as follows: Monarchy, aristocracy, and democracy combined, the two former being raised by merit to their respective stations, the land all belonging to the nation, moveable property only (including houses) being private property, the revenue raised by rent of land alone. No taxes. A catholic church organized upon the model of the state; a splendid ceremonial, ever varying, and teaching by emblems and symbolical representations, the great moral and intellectual truths of Nature. Education and the learning of a trade or profession enforced upon all. Public examinations, and competitions in all trades and professions. Marriage strongly recommended and almost enforced; moderation in the matter of reproduction taught as a branch of morality, encouragement being given to the publication of individual experience upon the subject. The subject of reproduction studied also as a branch of science, upon principles analogous to those by which we improve the breed of inferior animals. Few laws, and these very short—discretion in judge and jury, being preferred to statutes—the living law to the dead letter.

The LETTER has always been a curse to society, both in law and gospel. It is eighteen hundred years since a great Doctrinarian declared that the *letter* killeth, but the spirit giveth life, and yet we are still groaning under the strokes of the destroyer. Why? because the *living* law has not yet been established in the public mind.

It is only in a moral capacity that the people can govern. *Morality* is a simple natural feeling, which belongs to youth as much as to age, and to ignorance as much as to knowledge. It is a kindly social generous feeling, of which the poor show as much as the rich; and therefore, as moral governors, the people, as far as their intentions are concerned, are just as well qualified as the aristocracy. But they are not qualified for intricate legislation. Legislation requires knowledge; knowledge is a rarity, and without knowledge, good intentions are most frequently inefficient, capricious, and destructive.

The more letter there is in the law, the more knowledge and trickery are necessary to superintend it. The less letter there is in the law, the more moral feeling and conscience are necessary to its administration. This latter is the great object which we ought to aim at, the *moral government of society*, for it is thus only that the people can be sovereign. This is the true millennium, the reign of God, through the voice of a moral, a religious, an industrious, and therefore an enlightened people.

The reign of legislation, that is, of *human wisdom*, would then cease, and the reign of *divine wisdom*, that is CONSCIENCE, would then be firmly and for ever established.

THE CALCULATING BOY.

ZERAH COLBURN was certainly prodigy. We can conceive the possibility of many species of miracles, in spite of Mr. Hume's dogmatism about their impossibility; but we cannot conceive the practicability of such calculations as those of the calculating boy. But we must believe their truth. He was only six years of age, and could multiply, divide, and extract the square and cube root of the most formidable sums so rapidly that it was more like a work of inspiration than a process of reasoning. Being asked the square root of the number 106,929, he answered 327, before the figures could be written down; being requested to name the cube root of 268,336,125, he answered, with equal facility, 645! Being asked the factors which produced the number 247,483, he mentioned 941 and 263, which are the only two factors that will produce it. A person asked him the factors of 171,395, and he named the following as the only ones: $5 \times 34,279$, $7 \times 24,485$, $59 \times 2,905$, $83 \times 2,065$, $35 \times 4,897$, 295×581 , 413×415 . Being asked to give the factors of 36,083, he immediately replied, it had none, which is a fact, it being a prime number.

These are but specimens of the miracles performed by this child, whose extraordinary capacity was occasioned by a *nervous disease*; and both the disease and the intellectual talent vanished together. Disease is certainly a very wonderful thing—there is a sort of Divinity in it. This child, however, is a proof that it is possible, by a special organization of mind, to obtain intuitive perceptions of truths, which cost immense labour to the present mental constitution of man.

GEOLOGICAL ASPECT OF BRITAIN.

The Western Coast of Britain is a specimen of the primitive geological formations. The midland counties afford specimens of the carboniferous or coal formations which have been deposited above the former, and the Eastern Coast contains the chalk and alluvial deposits, which compose the best layer for agricultural purposes. Great Britain is therefore a little epitome of the world. But how does it happen that these deposits are arranged in this horizontal manner when they were originally laid one above another, the granite lying many miles below the surface, and the coal almost as far from the reach of human industry? The earth must have undergone some sad convulsions in

order to break up these beds of minerals and cause them to send up their edges to the surface. If these convulsions had not happened, we should never have seen nor heard of coal, tin, copper, and many other of the richest materials of arts and science. Is there no wisdom to be observed in this? The arrangement, or derangement, if you will, of the strata of the crust of the Earth, is as marvellous an instance of divine wisdom as the structure of an animal or vegetable. And it is the more particularly interesting to us intelligent beings, inasmuch as for man only, must this great revolution in the mineral world have been effected. The alluvial soil would have sufficed for the maintenance of all the other animal creation. Man only is a miner, a manufacturer, a chemist. He alone can convert these mineral remnants of a former world into valuable property, and subdue the poison of inorganic matter into the elements of intellectual gratification and moral improvement.

OPINION OF THE HINDUS ON A CHRISTIAN CHURCH ESTABLISHMENT IN INDIA.

THE Following address by certain Hindus, to Lord William Bentinck, while he was Governor General of India, is extracted from the *Calcutta Reformer*, of the 18th of August, 1833. We hardly know whether this appeal was penned in a spirit of jest or earnest. Probably it partakes of both characters. However that may be, the address affords matter of very interesting reflection; and so does the publication in which it appears, as our readers will readily acknowledge when we tell them that the *Calcutta Reformer* is a weekly newspaper, of sixteen folio columns, written, edited, printed, and published in that city, by native Hindu gentlemen, in the *English language*! It was commenced in 1831; and still exists. We think the publication one of the greatest curiosities of literature we ever met with; and not more curious than valuable, inasmuch as it gives us a correct insight into the actual state of the mental, moral, and religious culture of the Hindus; and, particularly, as regards their opinions on religion. The *Reformer*, though modelled after the plan of the ordinary English papers, is chiefly devoted to controversies with the Christians on religious and moral doctrines; and the liberality which they evince towards their opponents, proves them to be much further advanced in Universalism than most other nations.

The address in question (we have copied it literally, because, the orthographical and other critical mistakes in the original shew it to be the unassisted work of natives) begins thus:—

“To the Right Honourable Lord William Cavendish Bentinck, Governor general of India.

“We, the undersigned the members of a religious club, denominated the Grum Shuba, most humbly beg to bring to your Lordship's notice an injustice under which we are labouring, since the settlement of British power in this country.

“Your Lordship's well known disposition to do good to your subjects, which has been particularly displayed in one of your Lordship's late acts. We mean the 5th regulation of 1831, encourages us with a hope, that our grievances would be taken into your Lordship's consideration, and we doubt not, but that they would be redressed, if upon examination they are found to be really such; we would think it to be a breach of our duties, which we owe to ourselves and to our country to neglect this favourable opportunity to make our case known to your Lordship; whose name should ever be remembered by the sons of India as a political saviour in the regions of the East; for the many benefits which have been already conferred upon us, and which we still expect from his reign.

“Your Lordship is no doubt aware that there are eighty or a hundred millions of souls under your sway, who with us, believe that their religion (Hindooism) is a divine revelation, and that it is the only creed upon the face of Hindoostan, which can secure their temporal and spiritual welfare. Impressed with this belief we regret to state that of late there has been a lamentable decay of the religion, and consequently of the morality of our brethren the Hindoos. In proof of this assertion we need only direct your Lordship's attention to the conduct of many of the young, headstrong chaps, who regale themselves,

like the sons of Briton on Bergandy, beef steaks, and other forbidden fares. Had this corruption however, been confined to the young alone, we would have contended ourselves with the hope that time, and experience would bring them to their senses, and teach them the propriety of following the dictates of Shasters, and consequently of reason; but to our regret, astonishment and sorrow, we learn that this infection has reached both men and women, of advanced age; who though undergo, the outward ceremonies, and Poojahs enjoined by the laws of Munoo; yet do not scruple to eat and drink with the above mentioned youths who have forfeited both their caste and creed.

"In this alarming state of society we have no other means to prevent the growing evil, but to apply to your Lordship to appropriate a part of the immense sum of revenue, which is literally extorted from the poor Hindoos. The object of this taxation upon their pockets, is certainly to place the government on a proper footing, and thereby secure the lives and properties of the people from being injured by the wickedness or folly of men, who may be influenced by the Satan. But we are thoroughly convinced that this object can be accomplished by diffusing Hindooism, the only true religion on this side of the globe; and the crime would be lessened in proportion this creed, i. e. morality would be diffused.

"A notion has gone abroad that government has nothing to do with the religion of the people. Nothing can be more absurd than this opinion. For can it be believed for a moment that a ruler who is placed to protect the lives and properties of thousands should not promote and improve their religion? But experience, however, has proved it to the satisfaction of every man, capable of the least reflexion, that it is incumbent on government, which has the good of the people for its object, to promote religion among every class of its subjects. We rejoice to state that British government in India, be it spoken to its honour, has not neglected this most essential and important part of its duties. The encouragement it has afforded to Christianity, by supporting episcopacy from the revenue of the estate, is one of the numerous instances of English liberality. Bishop's Palace at Chouringhy, stands a memorable instance of the generosity of our rulers. The annual allowance of about 6000 rupees to his Lordship, and of a lakh more to the other clergymen, viz., archdeacons, deacons, reverends, &c. &c., (all goes from the pockets of the poor Hindoos) cries loudly that there is a government which does not withhold its fostering hands to the support of religion, nay of Christian religion! 'This is indeed,' says our report of the 5th Shrabun, 'one of those characteristic properties of our rulers, for which they have been so universally and so justly admired. For what can be more laudable than to take money from the poor and no less unchristian rascals, to whom nothing is left but a bare subsistence, to feed those who are inimicable to Brahma.'

"If this had been considered by your Lordship to be founded upon justice, what an injustice would it not be to us, the Hindoos, to deny the same support and encouragement to Hindooism, which we believe to be no less true than the boasted Christianity of Europe; which is professed by eighty millions of people and which is the only way to ascend to heaven. Will your Lordship then knowing the importance of religion, leave so many souls to be overwhelmed with vice and infidelity? Will your Lordship be so unlike a Hindoo governor, as to neglect both the temporal and spiritual happiness of your Lordship's numerous subjects; for the paltry consideration, of pound shilling and pence, or of colour and caste? We beg and intreat your Lordship to consider who you are, whence you are, and for whom you are, and for whom you have been raised to the dignity of a governor. We conjure your Lordship to enquire how few Christians are benefitted by the annual expenditure of two lakhs out of the revenue. We call upon your Lordship to try to know how many souls would be saved if a proportionate sum be allotted for Hindoo episcopacy? But if we would take the liberty of giving our opinion, we will not hesitate to request your Lordship to allot two crores of Rs. (as a fair proportionate annuity) for encouraging the religion of Brahma.

"Beware however, that in case of a refusal we shall probably remain silent at present without making any complaint whatever, but the time is fast approaching, when we shall demand what we now only request to have. It is not very safe to trifle with the religion of millions of people while to encourage an irreligion (as we consider Christianity to be) from their own pockets.

"Beware ye, Governor General of India. In conclusion we most earnestly pray to our gods and goddesses for a speedy recovery of your Lordships' health, that your Lordship would be soon able to pay attention to our grievances.

"We are your Lordships most faithful and Loyal subjects,
GAUDHA CANTH, the Chairman.

BHOTOOMGHUN DOSS }
BONDERPROSAND SEN. } Members of the Grum Shuba.
&c., &c., &c.

OLOOKCHUNDER SHURMO,
The Secretary."

[After reading the above, who will deny that the Hindus possess capabilities of a very high order? English supremacy, we opine, has more to fear from the natives themselves, than from the ambitious views of Russia, or any other government, whatever diplomatists may say. It is worthy of remark, too, that whatever may be the character of the British Government in India, the existence of the *Calcutta Reformer* is a convincing proof that it has put no undue shackles on the public press.]

GALLERY OF PANTHEISM.

SPINOZA'S DOCTRINE.

No. 2.

A theologico-political tract, containing some essays, in which is shown that liberty of thinking is not only inoffensive to religion and government, but also, that it cannot be taken from man without injuring both State and Church.

It is divided into twenty chapters—printed 1670, in Latin, from which the following is a faithful abstract:—

PROPHET or revelation is the true knowledge of any thing revealed to men by God; and he is a prophet who expounds and declares those things which God has revealed to persons, who cannot have any certain knowledge of their own, but must only, by mere faith, receive and embrace them. A prophet was called by the Jews "Nabi," i. e. an orator or interpreter.—Exodus vii. 1.

It follows from this definition that natural knowledge may be called prophecy, for those things which we know by the light of nature depend only upon the knowledge of God, and His eternal decrees; but because this knowledge is natural to mankind, being founded on principles common to all, it is of no value to the vulgar.

It is to be observed that the Jews never used to make mention of mediate and particular causes, nor even regarded them; but for the promoting of religion they had always recourse to God; for if they got money by the trade they said God gave it them, and if they earnestly desired any thing, they said God disposed their hearts to it, &c., so that the mode of speaking among the Jews being considered, all that any one of the seers says that God had declared to him must not be taken as supernatural knowledge.

All those things which have been revealed to the prophets, were revealed to them either by words or by figures and signs, which were either real and true, without the imagination of hearing and seeing prophet, or but imaginary, that is, the fancy and imagination of the prophet were so disposed, that he verily thought he heard words, or saw and beheld some signs.

The voice by which God called Samuel was not real; the voice which Abimelech heard was also imaginary. It is the opinion of some Jews that the words of the dialogue were not vocally pronounced by God.

Besides visions and signs, there is no other mode of revela-

tion founded upon Scripture, though there is no doubt that God may reveal Himself, in a direct manner, to man, without any corporeal means, merely through the medium of the mind. It is true that a mind fit to receive such a revelation must, of necessity, be of a more noble kind, and verily I think that no one was ever possessed of a nobler mind than Christ, who has learned the laws of God, not from signs and figures, but from God himself, so that God has revealed himself to the apostles, through the mind of Christ in a similar way, as he had revealed himself formerly to Moses, through an aërial voice.

It is my opinion that except Christ no man ever received revelation from God, but by the help of imagination, that is, words, signs, and visions—for which kind of prophecy there is not so much need of a perfect understanding as of a strong imagination.

However, that we may not be in error with regard to what we read in the Scriptures, that the spirit of God was infused into the prophets, it is necessary to know what the word spirit means in the original tongue. The word "ruah" signifies the wind, the breath, the soul, mind, will, and all the passions of man. Hence the expressions that the prophets were filled with the spirit of God, have no other meaning than that they were good men filled with the power of explaining supernatural things.

Revelation being an outbirth of signs and visions, the prophecy must necessarily be parabolical and enigmatical, and express all spiritual truth under a corporeal form. Thus Michael saw God sitting, Daniel as an old man, in a white dress, and Ezekiel as a fire.

And because imagination was wandering and inconstant, prophecy did not long continue with the prophets, nor was it frequent, but very rare, and in the same very seldom. But as such is the case, we must enquire how the prophets themselves came to a certainty of those things, which they knew merely by the means of their imagination.

That the prophets were men remarkable rather by their vivid imagination than by their understanding, is clear from Scripture. Solomon exceeded all men in wisdom, but not in prophecy. Heman, Darda, and Kalcoll, were men of great wisdom, but not prophets.

Wherefore those are widely mistaken to find, out of the books of the Prophets, the true knowledge of natural and spiritual things; and though this is clear, from the very nature of prophecy, yet I shall show that there was a difference between the prophets, not only in respect to their imagination, but also in respect to their opinions. In regard to the certainty of the prophecy, some other thing must accompany imagination to make it sure of the truth of its offspring. Therefore the prophets were not certain of what God revealed by the vision itself, but by a sign.—Gideon Judg. vi. 17,

Therefore Moses, Deuteronomy, xviii., 22, bids the people to ask a sign of any that pretended to prophecy, which sign was to be the foretelling of some future event. Yet in all cases the certainty of this prophecy was merely moral, not mathematical. Indeed Moses warns the people against prophets, who should teach to worship another God, though they confirmed their doctrines by miracles, seeing that the certainty of prophecy was not mathematical, but only moral; and that signs were given to convince the Prophet himself; it likewise follows that signs were given according to the opinion and capacity of the prophet; so that the sign which made one person certain, could not assure another; as the signs were different and various, so did also revelation vary in every prophet, according to the disposition of his imagination, the temper of his constitution, or the opinion of which he was possessed. The style also of the prophecy differs according to the cultivation of every prophet. So that this being considered, it is very evident that God has no peculiar style of speaking, but is according to this capacity of the prophet, eloquent, concise, sharp, rude, or obscure. God himself makes signs and miracles to tempt the people.—5 Matthew, xxiv. 24.—Ezekiel, xiv. 8.

Many have persuaded themselves that the Prophets knew all things within the compass of human understanding, and though several passages in scripture are against them, yet they are rather willing to say they do not understand them than to confess

Prophets were ignorant. For example, nothing is more plain than that Joshua believed that the sun moved about the earth, that the earth had no motion, and that the sun stood for some time still. Thus the drowning of mankind was revealed to Moses according to his capacity; for he thought no part of the world was inhabited but Palestina.

Adam knew no other attribute of God, than that He was the maker of all things.

To Laban, God revealed himself as the God of Abraham, because Laban believed every nation had a particular God. Abraham was ignorant of God's ubiquity and prescience. Moses did not know that God was omniscient, and that human actions were governed by his decrees.

From what has been said, we may easily see that the Prophets were ignorant of things merely speculative; that they were also of different opinions, and consequently erred in the knowledge of spiritual and natural things. We have not to rest our faith upon them, but believe as our reason or conscience dictates.

The gift of prophecy was not an exclusive privilege of the Jews, but other nations had also their prophets, and we find even in the Old Testament that Gentiles, and other uncircumcised, as Noah, Enoch, Abimelech, and Balaam, did prophecy. But having said enough on this head, I purpose now to treat of ceremony.

I think it is manifest that since the divine law which makes man happy, and teaches the right way of living, is universal to mankind, the ceremonies peculiar to the Jews are of no longer use. The prophet Isaiah plainly declares that by this divine law, is meant that universal law, which consists in living uprightly, not in ceremonies. As for Christian ceremonies, Baptism, and the Lord's Supper, were appointed as marks of the universal church, but not as things that contain any sanctity.

In regard to miracles, which are to the generality of mankind a clearer proof of the providence and power of God, than the works of Nature, I shall prove, first, that nothing can happen contrary to nature, whose order and course is eternal, constant and immutable; second, that miracles prove neither the power, providence, nor wisdom of God, which appear more manifest in the unchangeable order of Nature; third, that Scripture, by the decrees of God, means nothing but Nature; lastly, what we have to observe in regard to miracles.

The first particular is proved thus: that, whatsoever God wills, implies eternal verity and necessity, for the knowledge of God is not distinguished from his will, and we say the same thing when we say God wills and knows anything, because by the same necessity derived from the nature and perfection of God, whereby he knows anything to be what it is, by the same necessity, must God will that thing to be what it is: Should any one conclude that God does anything against the laws of Nature, he likewise must grant that God acts contrary to his own nature, which is the greatest of absurdities. If then nothing happens in nature which does not follow from its laws; if its laws are extended to all things which are within the compass of divine knowledge, it is manifest that whatever man calls a miracle, is only so in respect of his opinions, and signifies nothing, but some work or thing, of which we cannot discover the natural cause, or which has never been observed before by those who relate or see it.

In regard to the second point, I say that by a miracle, or a thing or event that cannot be explained by natural causes, we cannot conceive God's essence and existence, nor can we understand anything of God's nature; because if the existence of God be not of itself known to us, it must be concluded from notions, whose truth is so firm and unshaken that there cannot be a power by which these notions may be changed. Such notions are the immutability and congruity of the laws of Nature; or if we imagine that there is a power that can disturb this immutability and congruity, we must either deny the existence of the primitive intelligence, and all divine things. But on the contrary, when we know all things to be ordained and established by God, and that the operations of nature flow by necessity from the essence of God, it must be necessarily concluded that we know so much better God and his will, the better we understand and know natural things. So that by what has been said we may conclude that a miracle, whether contrary to

Nature or above it, is a mere absurdity, and that by a miracle nothing *must* be understood in scripture, but a work of Nature, which is indeed above human understanding or at least believed to be so.

We shall now show that the commands and decrees of God, and consequently his providence, are nothing else but the regular course of Nature, that is, when the scripture says anything was done by God, or the will of God, nothing more is to be understood but that it was done according to the rules of Nature, and not as the vulgar imagine, that Nature was idle and ceased from action, or that the order of Nature was for some time interrupted. To prove by consequence, what we intend, we will quote some scripture histories.

In the first book of Samuel, ix. 15, 16, it is said that God told Samuel in his ear that he would send Saul to him, and yet God did not send him as men use to send messages to another, but this mission of God was nothing but the order and course of Nature, for Saul sought his father's lost asses, and by advice of his servant he went to inquire after them at the Prophet Samuel.

Psaln cxv, 24, it is said that God turned the heart of the Egyptians to hate the Israelites, but the good and natural reason for it is given in the first book of Exodus. In the 9th book of Genesis, v. 13, God says to Noah, that he would set his bow in the clouds, which action of God is nothing but the optical delusion produced by the refraction of the sun beams in the falling rain. Psalm, cxlvii. 18, the natural operation and warmth of the wind, by which frost and snow are melted, is called the word of God, and Psalm civ. the wind is called the commandment of God. The locusts, also, by God's natural command, by an east-wind blowing a whole day and night, covered the land of Egypt, and left it again with a strong west-wind.—Exodus, x. 13, 19.

So that we may absolutely conclude, that all things which the scripture relate to have happened, did happen, as all things do agreeably to the laws of Nature; and if anything is related therein repugnant to the laws of Nature, it was invented by sacrilegious men; for whatever is against Nature is against reason, and whatsoever is against reason, must be rejected as absurd. Finally it must be observed, that many things are related in scripture to be real, which are of necessity merely imaginary, or bold allegories, for in that God descended from heaven in a fiery chariot.

These quotations will, we hope, be sufficient to impart a clear idea of Spinoza's theological views. In our next the metaphysical tenets of our author, such as are contained in his Ethics, will be laid before the public with the same simplicity. It is our intention to imitate the natural philosopher who first presents the specimen of a plant or mineral to his pupils, and afterwards tells them his own opinion about its nature and qualities.

HERMES.

ON REAL AND IMAGINARY THINGS.*

A DIALOGUE IN EXPLANATION OF THE ARTICLE "ON IDEALISM," IN NO. 3.

SCENE.—*The Transcendentalist discovered seated at a table, on which lie Kant's Critique; Hegel's History of Philosophy; Göchel on Hegel and his Times; Berkeley's works, and Trendelenburg's Aristotle's Logic. He is writing.*

T.—Let me see, let me see, another article on "Synthesis" must be written. (*a violent knocking heard*) Come in.

Enter Materialist.

M.—Ah, here you are at home, with all your mysterious rubbish about you. Thank God, I have not to read them. But I say, my dear fellow, keep these things to yourself, and do not attempt to overthrow the common sense of his majesty's subjects.

* I am sorry to interrupt the regular course of my articles by this dialogue, but I have heard that some object to my paper in No. 3, and even resolve to answer it. As I am convinced that their objections are founded on a misunderstanding of my meaning rather than any real difference of opinion, I have hoped to remove them by this dialogue.

T.—I! (*Opens his eyes very wide*) What have I been doing?

M.—Why you have been writing a parcel of articles to a most confounded book called the *Shepherd*, in which you plainly say that chairs and tables, instead of being real things, only depend on the imagination.

T.—The deuce I have, I don't remember anything of the kind.

M.—Egad, I'll soon refresh your memory. Here's No. 3 of the *Shepherd*, article "on Idealism," which you know you wrote.

T.—I know I did.

M.—And in which you distinctly call a brick wall imaginary.

T.—That I utterly deny.

M.—Upon my word that is cool! Allow me to read an extract: "I see a great brick colored surface before me. By an act of my will I send out my fist towards it, and catch a rap on the knuckles; in other words, I experience a sensation. All the things that I call solid are merely such that if I approach them, I find a resistance—a sensation. I cannot experience this without a movement on my part; had I not moved, I should never have experienced the solidity of the wall; in other words, the wall is only solid to those who have approached it, and, perchance, what we call its solidity it may not possess till the very moment of our approach." There now, Mr. T., that is saying that brick walls depend on our own imagination.

T.—My dear Sir, I am very sorry you have so thoroughly misunderstood me, and very sorry I did not write in a style sufficiently perspicuous to prevent such misunderstandings. The sentence just read was never intended to prove that a wall was imaginary, nor did such a thought ever cross my mind. However, I am glad you have called, as it may give us an opportunity of understanding one another. Sit down, and we will talk the matter over. (*M. sits down.*) You complain that I call real things imaginary. I think we should first understand the meaning of the words "real" and "imaginary." Look at this table at which we sit, strike it; do you call this a real table, or an imaginary table?

M.—A real table of course.

T.—Good! So do I. As yet there is nothing for us to quarrel about. Now close your eyes, take your hand off the table, and conjure up to your mind's eye the image of a table.

M.—(*With his eyes shut.*) I can fancy I see the image of a table at present.

T.—Well! The table you perceive with your mind's eye, while your bodily eye is closed, do you call it real or imaginary?

M.—That is, of course, the imaginary table.

T.—Good again! Nothing to dispute about yet! I wonder when we shall come to a point wherein we differ. The real table is the one which you perceive with your bodily eye, and feel with your bodily hand; the imaginary table is that which you can picture to yourself, when this real table is not present to your outward senses, just as you can fancy a friend to be present who may actually be at Calcutta.

M.—That is precisely what I mean.

T.—And what I agree to! Then to discover the difference between the "real" and the "imaginary," it will be no bad method to observe these two phenomena, and consider their distinguishing points.

M.—The best method in the world. Why, bless my soul, you don't talk half so wildly as I expected.

T.—I'll trouble you to shut your eyes again. Once more conjure up the image of the table. Are you bound to keep that image of the table before you, or can you at pleasure substitute anything for it. Can you turn it into a ship or a house?

M.—To be sure I can. Now my eyes are shut; I can bring before me what image I please. Now I fancy I see a cat—now a dog—now a soldier. I can make one come and the other go, just as I will.

T.—So I expected. Now look at this table, with your eyes open. Can you change that at pleasure into a cat or a dog?

M.—Certainly not: I am not a magician.

T.—Then one difference between the real and the imaginary table is, that one is wholly subservient to your will, and the other is not. Will this definition suffice then? A real thing

is that whose existence is not wholly subservient to our will—an imaginary one is that which is wholly subservient.

M.—Stop; I do not think I agree to that definition, though it holds good, as distinguishing the table here, and the one I perceive with my eyes shut; but the figures we see in dreams are imaginary, and yet they are not subservient to our will; on the contrary, I often have very disagreeable dreams, which I should like to get rid of, but cannot.

T.—Very good; then we must find the distinguishing points between dreams and realities.

M.—We must; and I think the visions of a lunatic may be considered as a kind of dreams, as those are not subservient to his will.

T.—Now, let me see; to make the case as strong as possible, I will suppose you dream every night of your life. Let us examine the meaning of this expression. It is, I think, that after going through a series of events, all of which are connected with each other, the chain is suddenly snapped, and you find yourself concerned in a new series of events, which have no connection with the preceding ones, and often no connection with each other. Once more the chain is snapped, and you find a third series of events, which are connected with the first series, and not with the second. Your situations, with respect to these several series, are called, “being awake—dreaming—waking from the dream.”

M.—Yes; I have no objection to your description of dreams. The events we see while awake form one connected series; the events we see in a dream do not—and even when these do, there is no connection between different dreams. Thus, what I see, while awake on Tuesday, is a continuation of that which I saw while awake on Monday, while Tuesday's dream is wholly unconnected with Monday's dream.

T.—Very good, indeed. The want of connection is really what constitutes the distinguishing point of a dream. However, I think we may say that a dream is more like a reality than a mere picture we can conjure up to our imagination while awake; the existence of the latter being subservient to our will, while that of the former is not.

M.—Certainly. A dream is so like reality, that at the time we fancy that it is real; and, indeed, the difference between real events and those of a dream seems to be that the former go on in a regular chain of cause and effect, which the latter do not.

T.—Very well. Then a real thing exists, according to the laws of cause and effect, while an imaginary thing does not. If this is subservient to our will, we call it an imaginary image—if, for the time of its appearance, we think it real, and it is not subservient to the will, we call it a dream. The waking dreams of madmen and hypochondriacs may be called delusions.

M.—Let me see. We distinguish a real thing from an imaginary one thus—first, by its not being subservient to our will, we distinguish it from an image created at pleasure; and, secondly, by its appearing, according to the laws of cause and effect, we distinguish it from a dream. Well, I agree to this.

T.—And my brick wall in the passage you read, was supposed to agree to these conditions. It was not supposed to have been created at will, like an imaginary image, nor to have started from the sea, like a figure in a dream, but to have been regularly caused by bricklayers and hods of mortar. I merely said there could not be resistance without there was something to be resisted, and that solidity, as manifested to the touch, is nothing more than resistance. That there was really a cause of this resistance, wholly independent of my imagination, and absolutely binding on my will, I never denied.

M.—You surprise me indeed! But methinks you denied substance.

T.—Not a bit of it. I am as staunch a supporter of substance as yourself, only I predicate life of substance, and a common materialist predicates nothing at all. What some call matter, I call God, in a particular manifestation.

M.—Then it appears to me you are very like a materialist after all.

T.—I am a decided materialist. That is, I agree with the philosophical materialists, though not with common ones. Priestley, the most ultra-materialist, says, take away attraction

and repulsion, and matter is gone, so say I. Priestley cannot conceive of a soul without corporeal sensations, neither can I. Priestley denies that matter in itself is like the phenomena offered to our senses. So do I. I dare say, on investigation, scarcely any difference would be found in our opinions.

M.—Well, I must wish you good morning. One thing I cannot help remarking as odd. I came here expecting a disputation; and yet we have been questioning and answering one another, without a point of difference having arisen between us.

T.—True. And this is not the first time that people have fancied they were opposed to each other's opinions, while really they only misunderstood each other's words.

N. B. The article “On Synthesis” to be continued in the next.

THE TRANSCENDENTALIST.

P. S. I hope my more philosophical readers will not be angry with me for returning to such truisms, when my last article really went to some depth. I thought it best to bar once for all, the unphilosophical objections of the common sense school, persons who decide in five minutes on points, which Aristotle would have taken years to investigate.

EARLIEST ORGANIC REMAINS—ANIMAL AND VEGETABLE.

As soon as we enter on the examination of strata of the transition series, the history of organic life becomes associated with that of mineral phenomena.

The mineral character of the transition formations presents alternations of slate and shale, with slaty sand stone, limestone, and conglomerate rocks; the latter bearing evidence of the action of water in violent motion; the former showing, by their composition and structure, and by the organic remains which they frequently contain, that they were for the most part deposited in the form of mud and sand, at the bottom of the sea.

Here, therefore, we enter on a new and no less curious than important field of inquiry, and commence our examination of the relics of a former world, with a view to ascertain how far the fossil members of the animal and vegetable kingdoms may or may not be related to existing genera and species, as parts of one great system of creation, all bearing marks of derivation from a common author.

Beginning with the animal kingdom we find the four great existing divisions of *Vertebrata*, *Mollusca*, *Articulata*, and *Radiata* to have been *coeval* with the commencement of organic life, upon our globe.

No higher order of *vertebrata* has been yet discovered in the transition formation than that of fishes.

The *Mollusca* in the transition series afford examples of several families and many genera, which seems at that time to have been universally diffused over all parts of the world. Some of these (e. g., the *Orthoceras*, *Spirifer*, and *Producta*) became extinct at an early period in the history of stratification, whilst other genera (as the *Nautilus* and *Terebratula*) have continued through all formations unto the present hour.

The earliest examples of *Articulated* animals are those afforded by the extinct family of *Trilobites* to the history of which we shall devote peculiar consideration, under the head of organic remains. Although nearly fifty species of these *Trilobites* occur in the strata of the transition period, they appear to have become extinct before the commencement of the secondary series.

The *Radiated* animals are among the most frequent organic remains in the transition strata. They present numerous forms of great beauty, from which I shall select the family of *Crinoides*, or lily shaped animals allied to star fish, for peculiar consideration in a future chapter. Fossil *Corallines* also abound among the radiata of this period, and show that this family had entered thus early upon the important geological functions of adding their calcareous habitations to the solid materials of the strata of the globe.

In the inferior regions of this series, plants are few in number, and principally marine; but in its superior regions, the remains of land plants are accumulated in prodigious quantities, and preserved in a state which gives them a high and two-fold im-

portance; first, as illustrating the history of the earliest vegetation that appeared upon our planet, and the state of climate and geological changes which then prevailed; secondly, as affecting, in no small degree, the actual condition of the human race.

The strata in which these vegetable remains have been collected together in such vast abundance, have been justly designated by the name of the carboniferous order, or great coal formation. It is in this formation chiefly that the remains of plants of a former world have been preserved, and converted into beds of mineral coal, having been transported to the bottom of former seas, and, estuaries or lakes, and buried in beds of sand and mud, which have since been changed into sandstone and shale.

Besides this coal many strata of the carboniferous order contain subordinate beds of a rich argillaceous iron ore, which the near position of the coal renders easy of reduction to a metallic state; and this reduction is further facilitated by the proximity of limestone, which is requisite as a flux to separate the metal from the ore, and usually abounds in the lower regions of the carboniferous strata.

A formation that is at once the vehicle of two such valuable mineral productions as coal and iron, assumes a place of the first importance among the sources of benefit to mankind, and this benefit is the direct result of physical changes which affected the earth at those remote periods of time when the first forms of vegetable life appeared upon its surface.

The important uses of coal and iron in administering to the supply of our daily wants, give to every individual amongst us in almost every moment of our lives, a personal concern in the geological events of those very distant eras. We are all brought into immediate connection, with the vegetation that clothed the ancient earth before one half of its actual surface had yet been formed. The trees of the primeval forests have not, like modern trees, undergone decay, yielding back their elements to the soil and atmosphere by which they have been nourished, but, treasured up in subterranean store-houses, have been transformed into enduring beds of coal, which in these later ages have become to man the sources of heat, light, and wealth. My fire now burns with fuel, and my lamp is shining with the light of gas, derived from coal that has been buried for countless ages in the deep and dark recesses of the Earth. We prepare our food and maintain our forges and furnaces, and the power of our steam engines, with the remains of plants of ancient forms and extinct species, which were swept from the earth, ere the formation of the transition strata was completed. Our instruments of cutlery, the tools of our mechanics, and the countless machines, which we construct by the infinitely varied applications of iron, are derived from ore, for the most part coeval with, or more ancient than the fuel, by the aid of which we reduce it to the metallic state, and apply it to innumerable uses in the economy of human life. Thus from the wreck of forests that waved upon the surface of primeval lands, and from ferruginous mud that was lodged at the bottom of primeval waters, we derive our chief supplies of coal and iron, those two fundamental elements of art and industry, which contribute more than any other mineral production of the earth to increase the riches, multiply the comforts, and ameliorate the condition of mankind.—*Buckland's Geology and Mineralogy, considered in reference to Natural Theology.*

POPULAR ASTRONOMY IN INDIA.

THE Hindoos of India are divided into three grand classes on the subject of Astronomy: 1st, the Jains or Bauddhas, followers of the Bauddha Sutra; 2nd, the followers of the Brahmanical or Puranic system, and 3rd, the Jyotishis, or followers of the Siddhantas or Astronomical system.

The Jains maintain that the Earth is an immense plain—that it has ever been and still is falling downwards in space, that there are two suns and two moons, and two sets of corresponding planets and constellations, the one for the use of that part of the Earth lying to the north of the mountain Merú,

believed to be in the centre, the other for the southern half. The moon they believe to be above the sun. The opulent Marwari merchants and bankers whom we find established at the three presidencies, and in all the large cities of India, are chiefly of this persuasion.

The followers of the Purans believe in a system very little different. They also maintain that the Earth is a circular plane, having the mountain Merú in the centre, but deny that it is falling in space, as the Jains maintain. They say it is supported by the great serpent Shesa. So says the Bhagavata, the most popular of the Purans. They say also that there is only one sun and moon, that the moon is double the distance of the sun; and that it was churned out of the sea, (it certainly looks more like butter than cheese), and that eclipses are formed by the monsters Ráhu and Ketú. Jhankar Acharya, who flourished about 400 or 500 years ago, was an eminent supporter of this system, and a persecutor of the Jains. This party is the largest of the three.

The Jyotishis, or followers of the Siddhantas, believe in a system widely differing from both of these. Their system is, with the exception of a few inconsiderable differences, that of Ptolemy. They teach the true shape and size of the Earth and the true theory of eclipses. They place the Earth in the centre of the universe, around which, as taught by Ptolemy, revolve the planets. This sect has spared no pains to confute the monstrous absurdities of the Jains and the Purans. Bhaskar Acharya is the most recent and popular astronomer of this sect, and he flourished about 800 years ago! They have always professed the greatest veneration for the learned men of the West, the Ionians or "Yavanas," as they call them; whilst the Purans have denounced those who hold any communication with men of these nations, termed by them the lowest of the low.

The above account of the three sects is abridged from an article in the *Journal of the Asiatic Society of Bengal*, Oct., 1834. The writer observes, that such is the reverence felt by the Hindoos for their own ancient writers, that it is utterly hopeless to attempt to teach them anything, which goes directly contrary to their conservative faith. This led him to the idea of teaching Hindoo children, through the medium of the Siddhantas, the books of the latter sect, and he says "I beg leave to assure you that in this short time (five months) I have succeeded in communicating more real knowledge and information than I have done in the previous ten years of my Indian life."

This gentleman also says, that he has, in making government surveys, overcome the prejudices of the people, and the Rajahs, merely by quoting a verse of the Siddhantas.

The following are specimens from Bhaskar Acharya's Treatise on the Globes.

"This sphere of the Earth, formed of the five elementary principles, viz., earth, air, water, the ethereal atmosphere, and fire, is perfectly round, and compassed by the orbits of the moon, Mercury, Venus, Mars, Jupiter and Saturn, and lastly, by that of the constellations. It has no material supporter, but stands fixed in air by its own inherent force. On its surface all living and inanimate objects subsist throughout, as well titans as human beings, gods as well as daityas."

"As heat is the inherent property of the sun and fire; as cold of the moon, fluidity of water, and hardness of stones, as the air is volatile, and the earth is immovable, and as other wonderful (oh how wonderful!) properties belong to other things; in like manner the power of attraction is inherent in this globe of Earth. By this inherent power anything projected into the air is attracted down to it."

This was written 600 years before Newton's celebrated discovery of attraction.

"A man on whatever part of the globe he is placed, thinks the earth to be under his feet, and that he is standing upright upon it. Men placed at the distance of ninety degrees or one-fourth of the Earth's circumference from each other, fancy each other to be standing at right angles to each other.

"Those who are placed at the distance of half the Earth's circumference from each other, are antipodes to each other, and fancy each that the others have their heads turned into directions exactly opposite to them, in exactly the same way as

a man beholds his shadow on the banks of a river. But neither do those who are standing at right angles to each other, nor those with their heads turned in opposite directions, feel any difficulty in maintaining their several positions. They stand as perfectly at ease in their respective positions as we do here."

A VERY SIMPLE AND NATURAL METHOD OF STEALING.

A curious case lately came under my notice of the effect of saline moisture and copper united on writing ink. The Bengal Bank referred to my examination, three Bank notes sent in by a native who protested he knew not how the numbers and signatures had disappeared; that he had left them in a small copper box, on his departure into the country, having precisely noted the amounts and numbers, and that on his return they were thus altered. The secretary of the Bank disbelieved the marvellous statement, because the endorsements remained untouched.

I conceived it would be very easy at first sight to restore the writing by the usual method of slightly acidifying the paper, and, testing with prussiate of potash, which if the smallest traces of iron remained would develop the letters in blue. The only effect, however, of this re-agent, was to develop a copious red brown upon the entire surface of the paper proving how strongly it had been impregnated with a solution of copper. In one of the three papers there was a general faint blue where the signature might be expected, but not the faintest trace of a number or letter could be recovered. It immediately occurred to me that a solution of copper would in fact dissolve away the iron while it deposited the copper, and thus leave none of the former metal to be acted upon by the prussiate. To prove this beyond a doubt, I selected paper containing black writing that had stood for many years uninjured, and placing it between two clean copper plates, allowed a current of acidulated water to pass through. In a minute or two, the whole writing disappeared, and could not be restored by the prussiate. Although the colour of the ink was merely discharged by acid, the usual effect was manifest. The native (Indian) ink being carbonaceous, remained uninjured throughout, and where even a slight proportion of this ingredient was mixed with the English ink, the removal was so far prevented. This circumstance presents a ready mode of obviating such accident for the future, for the present, is not, it appears, the first occasion of the kind. A poor native pilgrim took some notes to Jagannath, in a small copper roll kept on his person for safety. After the customary period of bathing in the sea he returned and found his notes effaced, nor would the bank at that time make them good to the unfortunate holder.

The preventive alluded to is simply to mix Bengali or Indian ink, half and half with the English metallic ink. I have long been in the habit of doing so for the labels of mineral cabinets, where it is known that pyrites and other substances frequently obliterate the traces of common writing ink.—J. P., SECRETARY of the Bengal Asiatic Museum.

TO THE READERS.

I am sorry to say that I shall be obliged to discontinue the *Shepherd* for some time. There is a considerable loss weekly, in its publication, which at present I cannot afford; I mean however, to finish the volume as soon as I shall find it convenient to spend the necessary outlay. If I may judge from the sale of the first volume, the money would not be lost, but return with a profit. But in the mean while, my finances are in such a condition that I cannot afford to speculate upon futurity. Were a hundred of my friends to come forward and subscribe and advance payment for four bound copies each (or one sovereign), I could go on merrily; but hitherto, I have fought with the prejudices and errors of society, unaided and unshielded, by any of the children of mammon; and perhaps it is my destiny so to continue. If so, I shall never complain. Perhaps the world uses me quite as respectfully as I use it. I do not much admire it. There is something in every corner of it I respect, but something also in every corner which I despise. I admire the learning of the church, but I despise its metaphysical and moral philosophy or theology. I admire the good intentions of the people but I dislike their intolerance, their ignorance, and

their illiberality. I am partially connected with all parties, but fully sympathise with none. Under such circumstances, I even wonder at my own success.

But I shall succeed still better; that is, the fundamental principles of Universalism, (which I have very imperfectly laid down in the *Shepherd*,) will take root in the public mind. The people cannot escape the infection. They are permanent or everlasting principles which are always true, which may be taught long before they are appreciated, but can never be refuted or suppressed. Newton preached his system twenty years to no purpose. Mahomet preached ten years before he got a convert. Whether my views be scientific, or fanatical, I have therefore still a precedent for hope. But it is foolish, perhaps even immoral in me or any other person to appropriate principles. They are not mine. Truth belongs to no man, it is divine property. The error or imperfection with which it is mixed up, belongs to me, as the individual; the truth to God, as the universal. By passing through other minds it will be purified and refined, illustrated and confirmed. It will lose its Smithism; but the basis of the doctrine taught in the *Shepherd* must be everlasting as the Sun in the heavens. It is not founded on any one aspect of nature, but upon universal Nature, and universal Providence.

The continuance of such a work as the *Shepherd*, would have a happy effect in at least collecting together minds of a similar calibre, and laying the foundation of a society of men upon eternal metaphysical and moral principles. We have already obtained several first rate metaphysical minds. The article of *Hermes* in the present number, almost tempted me to forego my resolution, until he had finished the subject of Spinoza. But this would require a sacrifice of ten pounds at least, which must, for the sake of the old man of the flesh, be laid out for a less metaphysical purpose. I am also sorry to part with our clever friend the *Transcendentalist*, whose mode of reasoning on abstract subjects is exceedingly ingenious. I must also allude to another valuable contributor who has written several reviews and articles on oriental affairs, who is the youngest penman of all, but who promises to have very enlarged and comprehensive views of all theological subjects, for which he professes himself indebted to our little work. In fine this second volume of the *Shepherd*, has been more a field for others than myself; and the work was growing more and more universal in its character, the principle being a rallying point for Catholic philosophy.

I know that many will be sorry, and many more, glad, in reading this announcement, but there is no cause for either joy or grief, in the event. It is merely a *circumstance*, that's all. I hope I shall soon be able to revive the work. In the meanwhile I am amusing myself two or three hours a day, in collecting other materials, some of which I have already begun to publish in a little penny weekly production, called LEGENDS AND MIRACLES, in which a number of interesting questions in history are brought together in a manner not to be found, as far as I am informed, in any other work. I give them without comment and without passing any judgment upon the testimony, which I have taken care to record; but they are curious documents, which will at least, if properly used, teach us all to form our opinions with extreme caution, and suspend our judgments upon many opinions which pass current for what are called facts, in the cant phrase of the day. There is one important fact, of which man at present is little aware, viz., his own ignorance and want of logical simplicity. The best poet is the most simple, he is simple even to childishness. If we cannot find a simple, yea even a childishly simple philosophy and religion, we shall never see peace on earth and good will amongst men. The moral and intellectual world is in ruins, and we and our posterity will have little else to do, for many generations, but removing the rubbish, not by letting it alone, but by collecting it together, and making "compost" of it.

We shall be very glad to receive by letter the names of such as are willing to subscribe as above hinted, were it for nothing more than the gratification of obtaining a list of our friends. Should they luckily amount to the number specified, we should boldly proceed and then call upon them for the payment of their subscription. The poor of our readers will at least give us credit for not addressing ourselves to them in this last paragraph.—J. E. S.

Z A D I G ;

OR, THE

BOOK OF FATE.

ZADIG; OR, THE BOOK OF FATE.

EPISTLE DEDICATORY.

TO THE
SULTANA SHERAA.

THE EIGHTEENTH OF THE MONTH SCHEVAL, IN THE
YEAR OF THE HEGIRA 837.

DELIGHT of every eye, torment of every heart, divine light of the mind! I kiss not the dust from thy feet, because thou seldom art seen out of the seraglio, and when thou art, thou walkest only on the carpets of Iran, or on beds strewed with roses. I here present you with a translation of the performance of an ancient sage, who having, happily, an independent fortune, and his time at his own disposal, amused himself with writing the history of Zadig; a work containing more instruction than probably you may at first imagine. I entreat you to indulge me so far as to peruse it; and then pass your impartial judgment upon it; for although you are in the bloom of life; though every pleasure invites you; though you are Nature's darling, and your mental accomplishments are equal to the beauties of your person; tho' the world resounds your praises from morning till evening, and consequently gives you a just claim to a degree of understanding superior to the rest of your sex; yet your wit is not offensive; though sprightly, your taste is refined; your imagination is lively and fertile; and I have frequently had the honour to hear you converse more learnedly than the wisest dervise, with his venerable beard and pointed bonnet. Though discreet, you are not mistrustful; though gentle and mild, not weak; you exercise your beneficence with discernment; you manifest your love for your friends, but you create yourself no enemies. Your sprightly sallies of wit are not sullied by detraction; nor is a misbecoming word ever heard to escape your lips. You detest the exercise of ill-nature, though it is constantly in your power. In short, your person is unexceptionable, and your soul immaculate! and, as you possess a degree of philosophy, I flatter myself you will derive more pleasure from the perusal of this work than any other lady of your exalted rank.

It was originally composed in the Chaldean language, with which both you and I are unacquainted. The Sultan Oulong-beg caused it to be translated into Arabic, for his own amusemant. It was first published at the time the Arabian and Persian Tales of a Thousand and One Days, and a Thousand and one Nights, were so much admired. The sultan delighted in Zadig, but his ladies preferred the Thousand and One. "How can you," said the wise Oulong, "prefer those stories which have neither sense nor meaning?" "Oh!" replied the sultanas, "the less sense they possess the more they are in taste; and the less their merit, the greater their commendation."

I flatter myself, thou patroness of wisdom, that thou wilt not resemble those thoughtless sultanas, thy predecessors, but deign to adopt the sentiments, of Oulong. I even hope that when thou art wearied with the conversation of those who take delight in such frivolous romances

as the Thousand and One, I shall be permitted for a moment to entertain thee with a rational history. Hadst thou been Thalestris, in the time of Scandar, the son of Philip; hadst thou been the queen of Sheba, in the reign of Solomon! those monarchs would have been proud to have visited thee.

May the celestial powers grant that thy pleasures may meet no interruption; thy charms know no decay; and thy felicity be everlasting.

APPROBATION.

I who have subscribed my name hereto, ambitious of being thought a man of wit and learning, have perused the manuscript, which I find to my great mortification, amusing, moral, philosophical, and fit to be read even by those who have an utter aversion to romances; for which reason I have depreciated it, as it deserves, and have in direct terms told the CADI-LESQUIER that it is a most detestable performance. * * * * *

ZADIG; OR, THE BOOK OF FATE.

CHAP. I.

THE BLIND OF ONE EYE.

IN the reign of King Moabdar, there was a young man, a native of Babylon, named Zadig, who was not only endowed by nature with an extraordinary genius, but born of illustrious parents, who bestowed on him an education in every respect suitable to his birth.

Though rich and young, he knew how to moderate his passions; he was free from affectation; and as he did not always act up to the strictest rules of reason himself, he looked on the foibles of others with candour and indulgence.

Every one was surprised to find, that, notwithstanding he had such a fund of wit, he never insulted, nor exposed by his railery, any of his companions, for that noisy and confused discourse, for those rash reflections, those hasty conclusions, and those insipid jokes; and, in short, for that redundancy of unmeaning words, which was called polite conversation in Babylon.

He had learned, from the first book of Zoroaster, that self-love is like a bladder full blown, from which tempests of wind proceed whenever it is pierced. Zadig, in particular, never boasted of his contempt of the fair sex, or of his facility in making conquests among them. He was of so generous a spirit, that he was not afraid of conferring obligations even on the ungrateful; strictly adhering to that maxim of Zoroaster, "When you are cal-

ing, give the dogs that are under the table, lest they should be tempted to bite you."

He acquired much wisdom ; since he was fond of the company of those only who were distinguished for men of sense. As he was well grounded in all the sciences of the ancient Chaldeans, he was no stranger to those principles of natural philosophy which were then known ; and understood as much of metaphysics as any one in all ages after him ; that is to say, he knew little or nothing of the matter.

He was firmly convinced that the year consisted of three hundred and sixty-five days and six hours, though directly repugnant to the new philosophy of the age he lived in ; and that the sun was situated in the centre of the earth ; and when the chief magi told him, with an imperious air, that he maintained erroneous principles, and that it was an indignity offered to the government under which he lived, to imagine the sun should roll round its axis, and that the year consisted of twelve months, he was wise enough to avoid the appearance of resentment or contempt.

As Zadig was immensely rich, and had consequently friends without number ; as he was of a robust constitution, and remarkably handsome ; as he was endowed with ready wit, and inventive fancy ; in a word, as his heart was perfectly sincere and open, he imagined himself, in some measure, qualified to be perfectly happy. For this purpose he determined to marry a young lady, named Semira, whose beauty, birth, and fortune rendered her the most desirable person in all Babylon. He had for her a sincere affection founded on honour ; and Semira conceived as tender a passion for him.

A short time before their intended union in the bands of matrimony, as they were walking together towards one of the gates of Babylon, under the shade of a row of palm-trees, that grew on the banks of the river Euphrates, they were beset by a band of ruffians, armed with sabres, bows, and arrows. These proved to be the guards of young Orcan, (nephew to a minister of state,) whom the parasites, maintained by his uncle, had persuaded that he had permission to do, with impunity, whatever he thought proper.

This young rival, though he had none of the accomplishments to boast of that Zadig had, yet he imagined himself to be greatly his superior, and, for that reason, was perfectly outrageous to see the other preferred to him.

This jealousy, the result of mere vanity, induced him to think he was deeply in love with the fair Semira ; and, fired with that notion, he was determined to take her away from Zadig by dint of arms.

The ruffians rudely seized her, and, in the transport of their rage, drew the blood of a beauty, the sight of whose charms would have softened the very tigers of mount Imaus.

The injured lady rent the very heavens with her exclamations. "Where's my dear husband?" she cried. "They have torn me from the arms of the man I adore."

She never reflected on the danger to which she herself was exposed ; her sole concern was for her beloved Zadig.

At the same time he defended her with all the resolution which love and valour usually inspire. With the assistance only of two domestic servants, he put those sons of violence to flight, and conducted Semira, senseless and bloody as she was, to her own house.

The moment she recovered, she fixed her lovely eyes on her dear deliverer, and exclaimed, "O, Zadig, I love

thee as affectionately as if I were thy bride : I love thee as a man to whom I owe my life, and, what is dearer to me than life, the preservation of my honour."

Never was passion more ardent than Semira's ; never did the fairest creature express sentiments more kind and tender ; these were inspired by gratitude for the most important of all benefits, and the warmest transports of a virtuous affection.

Her wounds were but slight, and she soon recovered. Zadig received a wound that was much more dangerous ; an unluckily arrow had grazed one of his eyes, and the orifice was deep.

Semira was incessant in her prayers to the gods that they might restore her Zadig. Her eyes were night and day overwhelmed with tears. She waited with impatience for the happy moment, when those of Zadig might behold her with delight and rapture. But alas ! the wounded eye grew so inflamed and swelled, that she was terrified to the last degree. She sent as far as Memphis, for Hermes, the celebrated physician, who instantly attended his patient with a numerous retinue.

Upon his first visit, he peremptorily declared that Zadig would lose his eye ; and predicted not only the day, but the very hour when that fatal disaster would befall him.

"Had it been," said that great man, "his right eye, I could have administered an infallible specific ; but, as it is the left, it is beyond the art of man to cure." All Babylon, while they lamented the fate of Zadig, were astonished at the profound penetration of Hermes. Two days after the abscess broke, without any application, and Zadig in a short time perfectly recovered.

Hermes therefore wrote a very long and elaborate treatise, to prove that his wound ought not to have been healed. Zadig, however, never thought it worth his while to peruse his learned lucubrations ; but as soon as he could go abroad, determined to pay the lady a visit, who had testified such uncommon concern for his welfare, and for whose sake alone he wished for the restoration of sight.

Semira he found had been three days out of town ; and he was informed, at the same time, that his intended spouse, having declared an insuperable aversion to a one-eyed man, was that very night to be married to Orcan.

At this unexpected ill news, poor Zadig was greatly afflicted, and laid his disappointment so much to heart, that in a short time, through grief of heart, he became a mere skeleton. At last, however, by force of reflection, he got the better of his distemper ; and the reflection of her inconstancy, in some measure, contributed towards his consolation.

"Since I have met with such an unexpected repulse," said he, "from a capricious court lady, I am determined to marry the daughter of some substantial citizen."

He accordingly made choice of Azora, a young woman extremely well bred, an excellent economist, and descended from respectable and opulent parents.

Their nuptials accordingly were soon after solemnized, and for a whole month successively, they enjoyed all the delights of the most affectionate attachment. In process of time, however, he perceived she possessed some degree of levity, and was much inclined to think that the handsomest young men were always the most virtuous and witty.

CHAPTER II.

THE NOSE.

One day Azora, when she returned home from taking a country walk, threw herself into a violent passion, and uttered the bitterest invective. "What my dear," said Zadig, "has thus ruffled your temper? What can be the meaning of all these frantic exclamations?"

"Alas," said she, "you would have been disgusted as much as I am, had you been an eye witness of that scene of female falsehood I observed yesterday."

"I went to visit the disconsolate widow Cosrou, who had been these two days erecting a monument to the memory of her young deceased husband, near the brook that runs on one side of her meadow. She made the most solemn vow, in the height of her affliction, never to stir from his tomb, as long as that rivulet took its usual course."

"Well! and wherein," said Zadig, "is the good woman so much to blame? Is it not an incontestible mark of her superior merit and conjugal affection?" "But, Zadig," said Azora, "were you to know how her thoughts were employed when I made my visit, you never would forgive her." "My dearest Azora, what was she then about?" "Why, the creature," said Azora, "was studying to find out ways and means to turn the current of the river."

Azora, harangued so long, and her expressions were so fraught with invectives against the young widow, that her affected, ostentatious show of virtue gave Zadig a secret disgust.

He had an intimate, named Cador, whose spouse was perfectly virtuous, and had in reality a greater regard for him than all mankind besides. This friend Zadig made his confidant, and secured his fidelity, by a promise of some valuable present.

Azora had been visiting a female companion for two days in the country, and on the third was returning home; no sooner, however, was she in sight of the house, than the servants ran to meet her, with tears in their eyes, and told her, that their master died suddenly the night before: that they were afraid to carry her the doleful tidings, but were going to bury Zadig in the sepulchre of his ancestors, at the bottom of the garden.

She burst into a flood of tears; tore her hair; and vowed to die by his side. As soon as it was dark, young Cador came, and begged the favour to be introduced to the widow, to condole with her upon the melancholy occasion. He was accordingly admitted, and they both joined in their lamentations. Next day their grief abated and they dined together. Cador informed her, that his friend had left him the greatest part of his effects, and gave her to understand that he should think himself the happiest of men, if she would condescend to be his partner in that demise.

The widow wept, sighed, and began to be reconciled. More time was spent at supper than at dinner. They discoursed together with more freedom. Azora was lavish of her encomiums on Zadig! but then it was true, she said, he had some secret infirmities, to which Cador was a stranger.

In the midst of their midnight entertainment, Cador suddenly complained that he was attacked with a most violent pain in his side.

The lady, alarmed at his indisposition, and eager to assuage his pain, flew to her closet of cordials, and brought down every thing she imagined could be of service: she was concerned that the famous Hermes had left Babylon, and condescended to lay her warm hand upon the

part affected. "Sir," said, she, in a soft languishing tone, "are you subject to this tormenting malady?" "Sometimes, Madam," said Cador, "so violently, that it brings me almost to the grave; and there is but one thing that can infallibly cure me; which is the application of a dead man's nose to the part affected." "Strange remedy truly," said Azora. "Not stranger, Madam," said he, "than the great Arnou's* infallible apoplectic necklace."

This assurance of success, together with Cador's personal merit, determined Azora in his favour.

"After all," said she "when my husband passes the bridge Tchimavar, from the world of yesterday, to the other of to-morrow, will the angel Afrail, think you, make any scruple about his passage should his nose prove something shorter in the next life than it was in this?" She was determined, however, to venture: and taking up a sharp razor, repaired to her husband's tomb; watered it first with her tears, and then proposed to perform the innocent operation, as he lay extended breathless in his coffin. Zadig arose in a moment, secured his nose with one hand, and the incision knife with the other. "Madam," said he, "never more exclaim against the widow Cosrou. The scheme for cutting off my nose is at least equal to her's of turning the river into a new channel."

CHAPTER III.

THE DOG AND THE HORSE.

ZADIG found by experience, that the first month of matrimony (as it written in the book of Zend) is the honey moon; but the second is that of wormwood. He was some time after obliged as Azora grew such a termagant and rendered his life so uncomfortable, to sue out a bill of divorce, and to seek happiness, in future, in the study of nature.

"Who is happier" said he "than the philosopher, who peruses with understanding that spacious book, which the supreme being has laid open to his intellectual faculties? The truths he discovers there are of infinite service to him. He thereby cultivates and improves his mind. He lives in peace and tranquillity all his days and fears nothing from men, and he has no tender indulgent wife to shorten his nose."

Absorbed in these contemplations, he retired to a little country house on the banks of the Euphrates: there he spent not his time in calculating how many inches of water ran through the arch of a bridge in a second of time, nor inquiring if a cube line of rain falls more in the mouse month than in that of the ram.

He formed no projects for making silk gloves and stockings out of spiders' webs, nor China-ware out of broken glass bottles; but he chiefly investigated the nature and properties of animals and plants, and soon, by his strict and repeated enquiries, was capable of discerning a thousand variations in visible objects, that others less curious, imagined all alike.

As he was one day taking a solitary walk by the side of a thicket, he saw one of the queen's eunuchs, with several of his attendants, coming towards him, running here and there, like persons distracted, and seeking with impatience, for something lost of the utmost importance. "Young man," said the queen's chief eunuch, "have you seen her majesty's dog?" Zadig very coolly replied, "You mean her bitch, I presume." "You answer right,

* There was at this time in Babylon a famous doctor named Arnou, who (in the gazettes) cured apoplectic fits, and prevented them from affecting his patients, by hanging a little bag about their necks.

Sir," said the eunuch; "it is indeed a spaniel bitch!" "And very small," said Zadig: "she has had puppies too, lately; she limps upon her fore foot, and has long ears." "By your exact description, Sir, you must doubtless have seen her," said the eunuch, almost out of breath. "I have not, Sir; neither did I know, but by you, that the queen had ever such a favourite bitch."

Just at this critical juncture, so various are the turns of fortune's wheel, the best palfry in all the king's stables had broke loose from the groom and got upon the plains of Babylon. The principal huntsman, with all his inferior officers, were in pursuit of him, with as much concern as the eunuch after the bitch.

The huntsman addressed himself to Zadig, and asked him whether he had not seen the king's palfry run by. "No horse," said Zadig, "ever galloped with more rapidity. He is about five feet high; his hoofs are very small; his tail is about three feet six inches long: the studs of his bit are of pure gold, about twenty-three carats; and his shoes are of silver, about eleven penny-weights a-piece." "What course did he take, where is he?" said the huntsman. "I never saw him," replied Zadig; "neither did I ever hear, before now, that his majesty had such a palfry."

The huntsman, as well as the first eunuch, upon his answering their interrogatories so very exact, not doubting in the least but Zadig had clandestinely conveyed both the bitch and the horse away, secured him, and carried him before the grand desterham, who condemned him to the knout, and to be confined for life in some remote and lonely part of Siberia. No sooner had the sentence been pronounced against Zadig, than the horse and bitch were both found. The judges were then under the disagreeable necessity of repealing their decision, as the innocence of the culprit was clearly proved.

However, they laid a fine upon him of four hundred ounces of gold, for his false declaration, in asserting that he had *not* seen, what doubtless he *had* seen; which was ordered to be deposited in court accordingly; but on payment he was permitted to bring his cause before the grand desterham. On the day appointed for that purpose he opened the cause himself in terms to this effect.

"Ye bright stars of justice, ye profound abyss of universal knowledge, ye mirrors of equity, who have in you the solidity of lead, the inflexibility of steel, the lustre of the diamond, and the resemblance of the purest gold! since ye have condescended so far as to admit of my address to this august assembly, I here, in the most solemn manner, swear to you by Oromasdes, that I never saw the queen's most illustrious bitch, nor the sacred palfry of the king of kings.

"I will however, be ingenuous, and declare the truth, and nothing but the truth. As I was walking by the thicket's side, where I met with her majesty's most venerable chief eunuch, and the king's illustrious principal huntsman, I perceived, upon the sand, the footsteps of an animal, and I easily inferred that they were those of a dog.

"The several small, though long ridges of sand between the footsteps of the creature, gave me just grounds to imagine that it was a bitch, whose teats hung down; and for that reason, I concluded she had but lately pupped.

"As I observed likewise other traces, in some degree different, which seemed to have grazed all the way upon the surface of the sand, on the sides of the fore-feet, I knew she must have had long ears. And, as I discerned, with some degree of curiosity, that the sand was every

where less hollowed by one foot in particular, than by the other three, I conceived that the bitch of our most august queen was a little lame, if I may presume so to say.

"As to the palfry of the king of kings, give me leave to inform you, that as I was walking down the lane by the thicket side, I took particular notice of the prints made upon the sand by a horse's shoes; and found that their distances were in exact proportion.

"From this observation I concluded the palfry galloped well. In the next place, the dust on the trees in a lane seven feet broad, was here and there swept off, both on the right and on the left, about three feet and six inches from the middle of the road. For which reason I pronounced the tail of the palfry, with which he had whisked off the dust on both sides, to be three feet and a half long.

"Again, I perceived under the trees, which formed a kind of bower of five feet high, some leaves that had lately fallen to the ground, and I was sensible the horse must have shook them off, from whence I conjectured he was five feet high.

"As to the bits of the bridle, I knew they must be of gold, and of the value of twenty-three carats, for he had rubbed the studs upon a certain stone, which I knew to be a touch-stone, by an experiment that I had made of it. To conclude by the prints which his shoes had left on some flint stones of another nature I judged his shoes were silver, and of the fineness I before mentioned."

The whole bench of judges stood astonished at the profundity of Zadig's discernment, and the news was soon carried to the king and queen.

Zadig was not only the whole subject of the court's conversation, but his name was mentioned with the utmost veneration in the king's chambers, and in his privy council.

And, notwithstanding several of the magi declared he ought to be burnt for a sorcerer, the king thought proper to order that the fine he had deposited in the court should be peremptorily restored.

The clerk of the court, the tipstiffs, and the other petty officers, waited on him in their proper habits, in order to refund the four hundred ounces of gold, pursuant to the king's express order; modestly reserving *only* three hundred and ninety ounces, part thereof, to defray the fees of the court.

The domestics also swarmed about him, in hopes of some *small consideration*.

Zadig saw how dangerous it was sometimes to appear too wise, and was determined, for the future, to be very circumspect both with respect to his words and behaviour.

An opportunity soon offered for the trial of his resolution.

A prisoner of state had just made his escape, and passed under the window of Zadig's house. Zadig was examined thereupon, but made no answer.

However, as it was plainly proved that he had looked out of the window at the time the prisoner passed, he was sentenced to pay five hundred ounces of gold for that misdemeanor; and moreover, was obliged to thank the court for their indulgence; a compliment which the magistrates of Babylon expect to be paid to them.

"Good God!" said Zadig, "how unfortunate it is to walk near a wood through which the queen's dog and the king's horse have passed! and how dangerous to look out of a window! In a word, how difficult for a man to be truly happy in this life!

CHAPTER IV.

THE ENVIOUS MAN.

ZADIG having met with such a series of misfortunes, resolved to ease the weight of them by the study of philosophy, and the agreeable company of a few select friends. He had a small house in the suburbs of Babylon, commodiously furnished; where every artist met with a favourable reception, and wherein he enjoyed all the rational pleasures that a virtuous man could desire. His library was every morning open to the learned, and at night the most cheerful companions surrounded his table; but he presently found how dangerous it was to associate with the sons of science. In the course of conversation, a warm dispute arose about a certain law of Zoroaster, in which griffins were prohibited to be eaten. "But wherefore that prohibition," said one of the company, "since there never was such an animal?" Others again insisted that such an animal must necessarily exist, otherwise Zoroaster would never have been so absurd as to give his disciples such a caution. To put an end to this affair, Zadig thus addressed them: "Friends, if there really are such creatures, let us never touch them; and if there are not, it is very certain we cannot touch them: therefore, however it be, we shall act agreeably to the law of Zoroaster."

A learned man, at the head of the table, who had written thirteen volumes displaying the properties of the griffin, took this affair in a very serious light, and threatened to accuse Zadig before one of the principal of the magi, named Yebor, who would have impaled Zadig, to do honour to the sun, and then would have recited the breviary with greater satisfaction.

His friend Cador (a friend of more value than a hundred magi) went to old Yebor, and said to him—"Long live the sun and the griffins! take care of punishing Zadig, for he is a saint; he has griffins in his inner court, and does not eat them; and his accuser is an heretic, who dares to maintain that rabbits have cloven feet, and are not unclean."—"Well," said Yebor, shaking his bald pate, "we must impale Zadig for having spoken disrespectfully of griffins, and the other for having spoken contemptuously of rabbits." Cador, however, put a stop to the affair, by means of a maid of honour, by whom he had a child, and who had great credit in the college of the magi; so that nobody was punished: whereupon many of the doctor's murmured, and presaged the ruin of Babylon. Zadig said to himself—"On what does happiness depend? I am persecuted by every thing in this world, even on account of beings that have no existence." He cursed the sons of learning, and, ever after this dispute, Zadig distinguished and preferred good before learned company, associating with the most conversable men, and the most accomplished ladies, in Babylon. He frequently made grand entertainments, which were generally preceded by a concert of music, and enlivened by the most agreeable conversation, in which, as he had experienced the disagreeable consequences of it, he laid aside all thoughts of appearing to be witty, which is not only the most certain proof that a man has no wit but the surest way to spoil all good company.

Neither the choice of his friends, nor that of his dishes, was the result of pride or ostentation. He took delight in appearing to be what he actually was, and not in seeming to be what he was not; and by that means obtained a greater character than he actually aimed at.

Opposite to his house lived Arimazes, a person elated with pride, who not meeting with success in the world,

sought his revenge in railing against all mankind. Rich as he was, he found it difficult to procure flatterers. Though the rattling of the chariots that stopped at Zadig's door was a perfect nuisance to him, yet the good character which every body gave him was a still higher provocation. He would sometimes intrude himself upon Zadig, and sit down at his table without any invitation: when there, he would most assuredly interrupt the mirth of the company, as harpies infect the very provisions they devour.

Arimazes invited a young lady to an entertainment; who instead of accepting his invitation, spent the evening at Zadig's. Another time, as Zadig and he were conversing together at court, a minister of state came up to them, and invited Zadig to supper, but took no notice of Arimazes. The most implacable aversions have seldom a more solid foundation. This person, who was called the *envious man*, resolved, if possible, to ruin Zadig, because he was generally distinguished by the title of the *happy man*.

"An opportunity of doing mischief," says Zoroaster, "offers itself a hundred times a day, but that of doing good but once a year."

Arimazes called one day on Zadig, when he was walking in his garden with two friends, and a young lady to whom he said many fine things, with no other design but the innocent pleasure of saying them. Their conversation turned upon a war that the king had happily put an end to, between him and his vassal, the prince of Hyrcania. Zadig having signalized himself in that short warfare, commended his majesty very highly, but was more lavish of his compliments on the lady. He took out his pocket-book, and wrote four extempore verses on that occasion, and gave them to the lady to read. The company then present begged to be obliged with a sight of them as well as the lady. But either through modesty, or rather a consciousness that he had not happily succeeded, he gave them a refusal. He was sensible, that extempore verses are seldom approved, but by those in whose honour they are written, and therefore, he snapt the tablet in two whereon the lines were written, and threw both pieces into a rose bush, where they were sought for in vain by his friends. A small rain falling shortly after, all the company returned to the house, except Arimazes, who, notwithstanding the shower, continued in the garden, till he had found one moiety of the tablet, which was unfortunately broken in such a manner, that even the half lines were good metre, though very short. But what was still more remarkably unfortunate, they appeared at a first view to be a severe satire upon the king; the words were these:—

To flagrant crimes
His crown he owes;
To peaceful times
The worst of foes.

This was the first moment that ever Arimazes was happy. He had it now in his power to ruin the most virtuous and innocent of men. Filled with his execrable joy, he hastened to his majesty with this virulent satire of Zadig's under his own hand.

Not only Zadig, but his two friends and the lady, were immediately close confined. His cause was soon over: for the judges turned a deaf ear to what he had to say. When sentence of condemnation was passed upon him, Arimazes, still revengeful, was heard to say, as he went out of court, with an air of contempt, that Zadig's lines were treason indeed, but nothing more.

Though Zadig did not value himself on account of

his genius for poetry, yet he was almost distracted to find himself condemned for the worst of traitors, and his two friends and the lady locked up in a dungeon, for a crime of which he was innocent. He was not permitted to speak one word for himself. His pocket-book was sufficient evidence against him.

So strict were the laws of Babylon! He was carried to the place of execution, through a crowd of spectators, who durst not condole with him, and who flocked about him, to observe whether his countenance changed, or whether he died with becoming fortitude. His relations were the only real mourners: for there was no estate in reversion for them; three parts of his effects were confiscated for the king's use, and the fourth was devoted, as a reward, to the use of Arimazes, the informer.

Just at the time he was preparing himself for death, the king's parrot flew from her balcony into Zadig's garden, and alighted on a rose-bush. A peach, that had been blown down, and driven by the wind from an adjacent tree, just under the bush, had fallen on a piece of the tablet to which it adhered. Away flew the parrot with her booty, and alighted on the king's hand. The monarch, being somewhat curious, read the words on the broken tablet, which had no meaning in them as he could perceive, but seemed to be the broken parts of a tetrastic. He was a great admirer of poetry; and the odd adventure of his parrot put him upon reflection.

The queen, who recollected full well the lines that were written on the fragment of Zadig's tablet, ordered that part of it to be produced: both the broken pieces being put together, they answered exactly the indentures; and then the verses which Zadig had written, in a flight of loyalty, ran thus:

Tyrants are prone to flagrant crimes;
To clemency his crown he owes,
To concord and to peaceful times;
Love only is the worst of foes.

Upon this the king ordered Zadig to be instantly brought before him; and his two friends and the lady to be immediately released from confinement. Zadig, as he stood before the king and queen, fixed his eyes upon the ground, and begged their majesties pardon for his little, worthless, poetical attempt. He spoke, however, with such a becoming grace, and with so much modesty and good sense, that the king and queen ordered him to be brought up again; when they gave him all the immense estate of Arimazes, who had so unjustly accused him; but Zadig generously returned the whole to the infamous informer. The envious man, however, felt no other sensation than the pleasure which arose from the restoration of his effects. Zadig every day grew more and more in favour at court. He was made a party at all the king's pleasures, and nothing was done in the privy council without him. The queen, from that very hour, shewed him so much respect, and spoke to him in such soft and endearing terms, that, in process of time, it proved of fatal consequence to herself, her royal consort, to Zadig, and the whole kingdom. Zadig now began to think that the attainment of happiness was not so difficult as he had formerly imagined.

CHAPTER V.

THE FORCE OF GENEROSITY.

A grand festival was held at Babylon at the end of every five years, and it was now near at hand. The design of it was, to distinguish that citizen from all the rest,

in the most solemn manner, who had performed the most generous action; and the grantees and magi always sat as judges. The first satrap, who had the care of the city, made known the most laudable actions that had passed in his district. All were put to the vote, and the king himself pronounced the definitive sentence. Persons of all ranks and degrees came to this solemnity, from the most remote parts of the kingdom. He who had the good fortune to be victor, received from his majesty's own hand a golden cup, ornamented with precious stones; and, upon the delivery, the king thus addressed him: "Accept of this as a reward for your generosity, and heaven grant that I may have thousands of such valuable subjects as you are!"

Upon this memorable day, the king appeared on his throne of state, dressed in all the pomp imaginable, and surrounded by his grantees, the magi, and the deputies from all the neighbouring nations, of every province that attended these public diversions, where honour was to be acquired, not by the swiftness of the best race horse, or by bodily strength, but by real merit. The chief satrap proclaimed, with a loud voice, such deeds as would entitle the victor to the glorious prize; but never took notice of Zadig's commendable action, in restoring to the envious man the possession of his fortune, notwithstanding he did all in his power to take away his life; that was but trifling, and not worth mentioning.

A judge was the first who was presented for the prize; he had been the occasion of a citizen's losing a very considerable cause, through some mistake, for which he was not responsible, and made him restitution out of his own private fortune.

The next candidate was a youth, who, notwithstanding he was greatly enamoured of a lady, and intended shortly to espouse her, yet resigned her to his friend, whose passion for her had almost brought him to his grave, and, at the same time, even bestowed on her a very considerable portion!

The next who stood forth was a soldier, who had executed a more praise-worthy action than that of the lover. In the Hyrcanian war, a party of the enemy having made his mistress prisoner, he attacked them with great bravery, and rescued her from their possession. A short time after, hearing that a band of the same party had carried off his mother to a place not far distant, he left his mistress, weeping bitterly, and flew to the succour of his mother. This skirmish being also ended, he came back to his mistress, and found her just at the point of death. Upon which he resolved to die with her, and was about to plunge a dagger in his breast; but his mother represented to him, that, should he die, she would have no support in her old age; and therefore, through affection for her, he had courage to live a little longer!

The judges were about to decide in favour of the soldier, but his majesty prevented them, by saying, that the soldier's action was unquestionably commendable, as were those of the rest, but none of them very remarkable. "I was infinitely surprised," said his majesty, "at what Zadig did yesterday: but I shall give you another instance. Not long since I banished my prime minister, Coreb, from the court, that he might feel my resentment. I complained greatly of his conduct, and every one of my sycophants told me that I behaved too mercifully to him, and loaded him with the keenest invectives. I desired Zadig's opinion of him, and he had the courage to give him an excellent character. I have undoubtedly read, in our public records, of instances where restitution has been often made for injuries done by mistake; where one has

resigned his mistress to another; and where a son has preferred his mother before his mistress; but I never found an instance of a courtier, who, like Zadig, had the courage to speak in behalf of a minister in disgrace, and with whom the king was displeased. Each candidate that has been proclaimed to-day shall receive twenty thousand pieces, but Zadig alone deserves the cup."

"Sire," replied Zadig, "it is yourself to whom the cup is due; you alone have done an action of unparalleled generosity: since you, who are the king of kings, was not offended with your slave when he contradicted you in the heat of passion." This discourse drew the eyes of all the multitude upon the king and Zadig. The judge, who had generously made restitution for his mistake; the lover, who had resigned his mistress to his friend; the soldier, who had preferred his mother's before his mistress's welfare; received the promised donation from the king, and saw their names entered in the book of fame: but the cup was given to Zadig. His majesty was universally beloved, but it was not of long duration. This glorious day was solemnized with festivals beyond the time by the law established. Tragedies were performed there that made the generality of spectators weep, and comedies that excited their laughter; entertainments of which the Babylonians were quite ignorant: the commemoration of it is still preserved in Asia.

"I have now," said Zadig, "arrived at perfect happiness," but he was most egregiously mistaken.

CHAPTER VI. THE JUST JUDGE.

Notwithstanding Zadig's youth, he was constituted chief judge of all the tribunals throughout the empire. He filled the place like one whom the gods had endowed with the strictest justice, and the most solid wisdom.

It was to him the surrounding nations were indebted for that generous maxim, "that 'tis much more prudent to acquit two persons, though actually guilty, than to pass sentence of condemnation on one that is virtuous and innocent."

It was his firm opinion, that the laws were intended to honour those who did well, as much as to be a terror to the vicious. It was his peculiar talent to render truth as obvious as possible; whereas most men study to render it intricate and obscure.

On the first day of his entrance into his high office he exerted this peculiar talent.

A rich merchant, and a native of Babylon, died in the Indies. He had made his will, and appointed his sons joint heirs of his estate, as soon as they had settled their sister, and married her with mutual approbation. Besides he left a legacy of 30,000 pieces of gold to that son who should, after his decease, be proved to love him best.

The eldest erected to his memory a very costly monument. The youngest appropriated a considerable part of his bequest to the augmentation of his sister's fortune: every one, without hesitation, gave the preference to the elder, allowing the younger to have the greatest affection for his sister. The legacy therefore was doubtless due to the elder.

Their cause came before Zadig, and he examined them apart.

To the elder, said Zadig, "Your father, Sir, is not dead, as is reported, but being happily recovered, he is on his return to Babylon."

"God be praised," said the young man. "But I hope the expence I have been at in raising this superb monument will be considered."

After this Zadig repeated the same story to the younger.

"God be praised," said he. "I will immediately restore all that he has left me; but I hope my father will not recal the little present I have made my sister."

"You have nothing to restore, Sir; you shall have the legacy of thirty thousand pieces; for it is you that have the greatest veneration for your deceased father."

A young lady, that was very rich, had entered into a marriage-contract with two magi; and having received instructions from both parties for some months, she proved with child. They were both ready and willing to marry her. "But," said she, "he shall be my husband, that has put me into a capacity of serving my country, by adding one to it."

"Tis I, Madam, that have answered that valuable end," said one; but the other insisted it was his operation.

"Well!" said she, "he that will give the child the most liberal education, I will acknowledge as its father."

In a short time after, the lady was delivered of a son. Each of them insisted on being tutor, and the cause was brought before Zadig. The two magi were ordered to appear in court.

"Sir," said Zadig to the first, "what method of instruction do you propose to pursue for the improvement of your young pupil?"

"He shall first be grounded," said this learned pedagogue, "in the eight parts of speech; then I will teach him logic, astrology, magic, the wide difference between the terms substance and accident, abstract and concrete, &c. &c."

"For my part, Sir, I shall take another method," said the second; "I will do my utmost to make him an honest man, and acceptable to his friends."

Upon this Zadig said, "You, Sir, shall marry the mother, let who will be the father."

Daily complaints came to court against the Itimadoullet of Media, whose name was Irax.

He was a person of quality, and possessed a very considerable estate, notwithstanding he had squandered away a great part of it, by indulging himself in all manner of expensive pleasures. It was seldom that he suffered an inferior to speak to him, and no person whatever dared to oppose his will.

No peacock was more gay; no turtle more amorous; no tortoise more indolent and inactive. He made false glory and false pleasures his sole pursuit.

Zadig, undertaking to cure him, sent him, as by express order from the king, a music master, with twelve vocal performers, and twenty-four violins, as his attendants; a house-steward, with six men cooks, and four chamberlains, who were never to be out of his sight. The king issued his writ for the punctual observance of his royal will; and thus the affair proceeded.

The first morning, as soon as the voluptuous Irax awoke, his music master, with the vocal and instrumental performers, entered his apartment. They performed a cantata, that lasted two hours and three minutes. Every three minutes the chorus or burthen of the song, was to this effect:

'Tisn't in words to speak your praise;
What mighty honours are your due;
To worth like yours we altars raise;
No monarch's happier, Sir, than you.

After the cantata was over, the chamberlain addressed him in a formal harangue for three quarters of an hour without ceasing; wherein he extolled every virtue to which he was a perfect stranger.

When the oration was over, he was conducted to dinner, where the musicians attended, and began to play as soon as he was seated at table.

Dinner lasted three hours before he condescended to speak a word. When he did speak, "You say right, Sir," said the chief chamberlain. Scarce had he uttered four words more, but "right, Sir," said the second. The other two chamberlains continually laughing with admiration at Irax's smart repartees, or at least at such as he ought to have made.

After the cloth was drawn, the adulating chorus was repeated.

The first day Irax was all in raptures; he imagined, that this honour done him by the king of kings, was the sole result of his exalted merit. The second was not altogether so agreeable. The third proved somewhat troublesome; the fourth insupportable; the fifth was tormenting; and, at last, he was perfectly outrageous at the continued peal in his ears of "no monarch's happier, Sir, than you."—"you say right," &c., and at being daily harangued at the same hour.

Whereupon he wrote to court, and begged of his majesty to recal his chamberlain, his music master, with all his retinue, his house steward, and his cooks; and promised, in the most submissive manner, to be less vain, and more industrious for the future.

Though he did not require so much adulation, nor such grand entertainments, he was much happier; for, as Sadler has it, "one continued scene of pleasure is no pleasure at all."

Zadig every day gave incontestible proofs of his amazing penetration, and the goodness of his heart; he was adored by the people, and beloved by the king. The little difficulties that he met with in his first stage of life, served only to augment his present felicity.

Every night, however, he had a dream, that gave him disturbance. One while he imagined himself extended on a bed of withered plants, amongst which there were some that were sharp pointed, and made him very restless and uneasy; another time, he fancied himself reposed on a bed of roses, out of which rushed a serpent that stung him to the heart with his envenomed tongue. "Alas!" said he, waking, "I was recently upon a bed of hard and nauseous plants, and this very moment I reposed on a bed of roses. But then the serpent!"

CHAPTER VII.

THE FORCE OF JEALOUSY.

The preferment of Zadig, or rather his intrinsic merit, was the principal cause of all his future misfortunes. He discoursed familiarly every day with his sovereign, and his beloved consort, Astarte; and the pleasure arising from thence was greatly enhanced by an intimate desire of pleasing, which is to the mind the same as dress is to beauty.

The youth and graceful deportment of Zadig had a much greater influence on the queen than she really perceived: and she cherished an affection which she was by no means conscious of. Astarte would say, without the least reserve or apprehension, that she was delighted with the company of one, who was not only greatly esteemed by her august consort, but was the favourite of the whole empire.

She daily praised him in her royal consort's presence; he was her favourite topic amongst the ladies of honour, whose eulogiums of him even exceeded her own. Such repeated encomiums, however innocent, made a deeper impression on her heart than she at that time apprehended.

She made presents to Zadig, in which there was more of gallantry than she imagined. She spoke no more in his praise, as she imagined, than a queen might innocently do, who had good assurance of his attachment to her husband; sometimes, indeed, she would speak with that tenderness and affection which resemble the expressions of a woman enamoured.

His royal mistress was more beautiful than either Semira, who had such an aversion to a husband with but one eye: or Azora, his late affectionate spouse, who would innocently have robbed him of his nose. The pleasing familiarity of Astarte, her tender expressions, which sometimes crimsoned her cheeks, the glances of her eyes, which she would turn away, if perceived, and which she fixed upon his, all conspired to kindle in Zadig's heart a fire, at the thought of which he trembled. He used his utmost efforts to extinguish it; he called up all the philosophy he was master of to his aid; but all to no purpose, for those reflections afforded no consolation.

Duty, gratitude, and an injured sovereign, appeared incessantly before him, as avenging deities; he struggled resolutely; he even triumphed; but this conquest over his passions, which he was obliged continually to check, cost him abundance of sighs and tears. He durst not again speak to the queen with that freedom which had hitherto proved but too agreeable to them both: his eyes were veiled with a mist; his conversation was forced, unconnected, and had the appearance of constraint; he kept his eyes off her as much as possible; and when they undesignedly met those of Astarte, he found, that though drowned in tears, they darted flames of fire; in silence they seemed to say, "We adore each other, and yet are afraid to love: we equally burn with a fire which we equally condemn."

Zadig retired from her presence, full of perplexity and despair; his heart was overcharged with a burthen too great for him to bear.

In the heat of his conflict, he disclosed the secrets of his heart to his faithful friend Cador, as one who, having long groaned under the weight of an inexpressible anguish of mind, at once makes known the occasion of his torments by the groans extorted from him, and by the drops of cold sweat which hang on his brow.

"I have long," said Cador to him, "observed that secret passion which you have fostered in your bosom, and yet endeavoured to conceal even from yourself. The passions are generally accompanied with such strong impressions that they cannot be concealed. Confess ingenuously, therefore, Zadig, since I have made this discovery, whether his majesty has not shewn some visible marks of his resentment. His only foible is that of being the most jealous of mankind. You are more careful of checking the violence of your passion than the queen herself is; because you are a philosopher; because you are Zadig. Astarte is no more than a weak woman; and though her eyes speak too visibly, and with too much imprudence, yet she does not imagine herself to blame. Convinced of her innocence, to her own misfortune, as well as yours, she keeps not a sufficient guard over herself. I tremble for her, because I am certain her conscience acquits her. If you were both agreed, you might conceal your regard for each other from the whole world. A rising passion, that is smothered, breaks out into a flame; when once love is gratified, it knows how to conceal it with art."

Zadig trembled at the thought of violating the bed of his royal benefactor; and never was there a more loyal

subject to a prince, though guilty of an involuntary crime. Her majesty, however, so often mentioned Zadig's name, and blushed so much whenever she uttered it; at one time she was so much delighted, and at another so much dejected, when he became the topic of conversation in the presence of the king; she was in such a reverie, so confused and absent, when he went out of their presence, that her behaviour made her royal spouse very uneasy. He was convinced of every thing he saw, and formed in his mind an idea of numberless things which he saw not. He took particular notice of Astarte's sandals, which were blue, Zadig's being of the same colour; he also observed, that as the queen wore yellow ribbands, Zadig's turban was of the same colour also. These were dreadful prognostics for the sovereign of his disposition to think on. In a mind so distempered as his, suspicions are converted into real facts.

All court slaves and sycophants are so many spies upon kings and queens: they presently discovered that Astarte was fond, and Moabdar jealous. Zadig's envious foe, Arimazes, had not corrected his malevolent disposition; for flints never soften, and venomous animals always preserve their poison. He wrote an anonymous letter to the king, the base recourse of sordid spirits, who are universally despised; but in this case a very important affair; because this letter agreed with the dreadful suggestions Moabdar had conceived.

All his thoughts were now bent upon seeing himself revenged; for which purpose he resolved to take off his wife by poison on a certain night, and to have Zadig strangled by day-break.

A merciless, inhuman eunuch, the ready executioner of the king's vengeance, received orders for that purpose. While his majesty was disclosing this horrid plot to the eunuch, there happened to be a dwarf, who was dumb, but not deaf, in the royal chamber. No one regarded him; he saw and heard every thing that passed, and yet was no more suspected than any irrational domestic animal.

This dwarf, who had a great regard for Astarte and Zadig, heard with equal horror and surprise the orders for their deaths, but how to prevent those orders from being put into execution was his principal concern, as the time was so short, and no opportunity was likely to offer for effecting that purpose. He could not write, but he had fortunately been taught to draw, and take a likeness.

He employed himself a good part of the night, in delineating with crayons, on a piece of paper, the great danger that thus attended her majesty. He displayed in one corner the king very much enraged, and commanding the barbarous eunuch to put his design in execution; in another a bowl and a cord upon a table; in the centre was the queen, expiring in the arms of her maids of honour, with Zadig strangled, and laid breathless before her. The rising sun was just making its appearance in the horizon, to denote that this dreadful scene was to be transacted at day-break. When his piece was finished, he ran with it to one of Astarte's female favourites then in waiting, awakened her, and gave her to understand, that she must immediately carry the draught to the queen.

Meanwhile, her majesty's attendants, though it was in the middle of the night, knocked at the door of Zadig's apartment, waked him, and gave him a letter from Astarte.

He at first was doubtful whether it was not a dream, but presently read the letter, with a trembling hand, and a heavy heart: it is impossible to express his astonish-

ment, and the agonies of despair he was in, upon reading the following words:

"Depart from Babylon, dear Zadig, immediately, for your life is in danger. I conjure you to depart, dear Zadig, in the name of that fatal passion with which I have long struggled, and which I now venture to disclose to you, as I shall in a little time make atonement for it with the loss of my life. Although I am not conscious of having committed any crime, I find I am to feel the weight of the king's resentment, and suffer the most cruel of deaths."

It was with the utmost difficulty that Zadig could speak. Having ordered his friend Cador to be called, as soon as he entered the room, he presented him the billet, without saying a word.

Cador urged him to pay all due attention to the contents, and to set out that moment for Memphis. "If you hope to have an interview with Astarte first, you inevitably hasten her execution; or if you wait upon his majesty, the fatal consequence will be the same. I shall use my utmost efforts to prevent her wretched fate; do you therefore follow your own. I shall report it in the city, that you are gone to the Indies; and when the pursuit of you shall be discontinued, I will come and inform you of every occurrence."

Thus saying, Cador immediately ordered two of the swiftest dromedaries to be ready at a private door belonging to the court; he helped Zadig to mount his beast though ready to faint. He had no more than one faithful servant to attend him; and Cador, very much grieved at this unfortunate affair, soon lost sight of his worthy friend.

In a little time our illustrious fugitive reached the top of a small hill, from whence he had an extensive view of all the city of Babylon; and looking towards her majesty's palace, he fainted away; but soon recovering his senses, his cheeks were bathed with tears, and he eagerly wished for death.

In short, after he had reflected, with horror, on the wretched fate of the most amiable of women, and the most worthy queen that ever reigned, he, sighing, thus exclaimed:

"What is this mortal life! What the better am I, O virtue, for following thy dictates! Two women, a mistress and a wife, have proved false to me; a third, innocent as the child unborn, and far more beautiful than either of them, has probably before this time suffered death on my account! All the acts of benevolence which I have shewn, have been the foundation of my sorrows; and I have been exalted to the height of grandeur for no other purpose than to be hurled down with the greater precipitation. Had I led a wicked life, like some other miscreants, I had now, like them, been happy."

Filled with these melancholy reflections, his eyes obscured with the veil of grief, the paleness of death on his countenance, and his soul swallowed up in the blackest despair, he continued his journey towards Egypt.

CHAPTER VIII.

THE WIFE BEATEN.

ZADIG directed his course by the stars. The constellation Orion, and the radiant dog-star, guided him towards the Pole of Cannopæa. He beheld with amazement those large globes of light, which appeared to the naked eye no more than small twinkling sparks, whereas the earthly globe he was then traversing, which, in reality, is no more than an imperceptible point in nature, seemed, according to the imperfect idea we generally

entertain of it, something very immense and extremely grand. He next turned his thoughts upon mankind, and regarded them, truly, as insects, devouring each other on a small atom of clay. He greatly alleviated his misfortunes, by reflecting in this manner, and recollecting the nothingness, if we may be allowed the expression, of his own being, and even of Babylon itself. His capacious soul now soared into infinity; and he contemplated, with the same freedom as if she was disencumbered from her earthly partner, on the unchangeable order of the universe. But presently resuming her native seat, he began to think that Astarte might probably have lost her life for his sake; upon which, his thoughts of the universe immediately vanished, and his whole attention was busied in imagining that he beheld the queen at the point of death, and himself overwhelmed with troubles.

Giving himself up to this flux and reflux of sublime philosophy and anxiety of mind, he insensibly found himself on the frontiers of Egypt; and his faithful servant had, unperceived by him, stepped into the first village, and sought a proper lodging. Meanwhile Zadig made the best of his way to the neighbouring gardens; where he beheld, at a small distance from the highway, a woman weeping bitterly, and begging the aid of heaven and earth in her distress, and a man in a violent passion, pursuing her. He now overtook her, and she, falling on her knees before him, implored his forgiveness: but she received only blows and reproaches.

The Egyptian's barbarous violence, and the woman's reiterated entreaties for pardon, made Zadig imagine that the man was a jealous husband, and that the fair one was an inconstant, and had defiled his bed: but when he reflected that she was extremely handsome, and, in his eyes, not unlike the wretched Astarte, he felt a compassion glowing within him towards the lady, and became enraged at her tyrant. "For heaven's sake, sir, assist me!" said she to Zadig, weeping bitterly. "Oh! deliver me from this hard-hearted man. Save, sir, O save my life."

Zadig hearing her lament so bitterly, interposed between the injured lady and her cruel tormentor, and thus expostulated with the Egyptian in his own language: "Dear sir, if you are possessed of the least degree of humanity, I beg you will have some compassion upon so charming a creature; pay some regard, I beseech you, to the weakness of her sex. How can you use so cruelly a woman, who lies weeping at your feet for forgiveness?"

"What!" exclaimed the jealous man, "are you too one of her gallants? I shall immediately revenge myself on you."

Thus saying, he left the lady, whom he had before held by the hair, furiously seized his lance, and endeavoured to bury it in the stranger's bosom. Zadig, however, being cool, easily warded the intended blow. He caught hold of his lance towards the point. One strove to recover it, and the other to make himself master of it by force. In the contest they broke it. Upon which the Egyptian drew his sabre. Zadig did the same; they fought: the former made a number of precipitate passes, which the latter dexterously parried. The lady seated herself upon a grass-plot, adjusting her head-dress, and looking on the combatants.

Zadig was not so strong as the Egyptian, but he was more alert. The former fought as a man whose arm was guided by judgment; the latter as a mad-man, who dealt about his blows at random. Zadig, took the advantage, and disarmed him; and perceiving the Egyptian

became more enraged than ever, and tried frequently to lay him on the ground by dint of strength, Zadig dexterously tripped up his heels; then holding the point of his sword to his breast, like a man of honour, gave him his life. The Egyptian, fired with rage, drew a dagger, and wounded his generous antagonist, at the very instant he granted him his pardon. Zadig was greatly incensed at this unexpected action, and immediately plunged his sabre into his heart. The Egyptian groaned in a dreadful manner, and expired upon the spot.

The victor then approached the lady, and told her, in the tenderest terms, that he was obliged to kill the man who had assaulted her, though much against his will. "I have avenged your cause," he said, "and freed you from the tyranny of the most brutish of men. Now, madam, inform me of your farther will and pleasure with me."

"You shall die, villian," said the lady; "you have slain my lover. Oh! I could tear you to pieces."

"Indeed, madam," said Zadig, "you had one of the most fiery lovers I ever beheld. He beat you most unmercifully, and would have killed me because I came to your aid."

"I wish he was alive to beat me again," said she, weeping; "he had just reason for so doing. His jealousy was but too well grounded. Would to God he had beat me, and you had perished in his place."

These words greatly surprised Zadig, who was much exasperated. "Really, madam," said he, "you assume such extravagant airs, that you tempt me, handsome as you are, to give you a severe chastisement in my turn, but I scorn to trouble myself any farther about you." Thus saying, he remounted his dromedary, and advanced towards the village; but before he had proceeded an hundred yards, he turned back upon an outcry that was made by four couriers from Babylon, who were riding full speed. As soon as one of them saw the young widow, he cried out, "There she is; that is she. She perfectly answers the description we had of her." They took not the least notice of her dead gallant, but immediately secured her. "Oh! Sir," cried she frequently to Zadig, dear Sir, most generous stranger, once more deliver me from these horrid ruffians. I humbly beg pardon for my ungenerous behaviour to you. Assist me at this critical moment, and I shall be your most obedient slave till death."

Zadig had no inclination to endanger his life for one who was so undeserving. "Find some other to be your dupe, now, Madam," replied he; "you shall not dupe me a second time; I am now better acquainted with your artifice." Besides the wound which he had received, so fast, that he stood in need of assistance himself; and probably the appearance of the Babylonian couriers, who were sent by king Moabdar, might greatly disturb him. He therefore hastened to the village, not being able to conceive what could be the meaning of the Babylonish officers securing the young widow: and still more at a loss to account for her ridiculous behaviour.

CHAPTER IX.

SLAVERY.

The moment Zadig entered the Egyptian village, he was surrounded by the people. The universal cry was, "See! see! there is the person who ran away with the beautiful Lady Missouf, and assassinated Cletosis."

"God forbid," said Zadig, "that I should ever entertain a thought of running away with the lady you speak of: she is too capricious; nor did I assassinate Cletosis, but killed him in self-defence. He endeavoured to take

away my life, because I entreated him to have compassion on the beautiful Missouf, whom he was beating without mercy. I am a stranger fled hither for shelter; and it is highly improbable that, upon my first entrance into a country where I came for safety and protection, I should be guilty of two such enormous crimes, as that of running away with the partner of another man, and clandestinely assassinating him on her account."

The Egyptians at that time were just and humane. The populace hurried Zadig to the town gaol; but they took care, in the first place, to stop the bleeding of his wounds; and afterwards examined the supposed delinquents apart, in order to discover, if possible, the real truth.

They acquitted Zadig of the charge of wilful and premeditated murder; but as he had taken a subject's life away, though in his own defence, he was sentenced to be a slave, as the law directed.

His two dromedaries were sold in open market, for the service of the hamlet; what money he had was distributed among the inhabitants; and he and his attendant were exposed in the market place to public sale.

An Arabian merchant, named Setoc, purchased them both, but as the valet, or attendant, was a robust man, and better qualified for hard labour than the master, he fetched the most money. There was no comparison to be made between them. Zadig therefore was a slave subordinate to his valet; they were linked together by a chain upon their legs; and in this condition accompanied their master home.

Zadig, as they were on the road, comforted his fellow slave, and exhorted him to bear his misfortunes with patience: but, according to custom, he made several reflections on the vicissitudes of human life.

"I am now sensible," said he, "that my unpropitious fortune has some malignant influence over thine; every occurrence of my life hitherto has proved strange and unaccountable. I have been condemned to pay a fine for having seen the traces left by the feet of a dog. I have suffered the fear of being impaled on account of a griffin. I was sentenced to die at Babylon, for writing a short panegyric on the king, my master. I narrowly escaped being strangled, for the queen his royal consort's speaking a little too much in my favour; and here I am a joint slave with thyself, because a turbulent gallant would beat his lady. However, comrade, let us march on boldly; let not our courage be cast down; all this may possibly have a happier issue than we expect. It is absolutely necessary that these Arabian merchants should have slaves, and why should not you and I, as we are but men, be slaves as thousands of others are? This master of ours may not prove inexorable. He must treat his slaves with some thought and consideration, if he expects them to do his work."

This was the substance of the discourse which Zadig made to his comrade; but his mind was more engaged on the misfortunes of the queen of Babylon.

Two days afterwards Setoc set out with his two slaves and his camels for Arabia Deserta. His tribe dwelt near the desert of Horeb. The way was long and tedious. Setoc, during the journey, paid a much greater regard to Zadig's valet than to himself, because the former was the most able to load the camels; and therefore what little distinctions were made, they were in his favour.

It so happened that one of the camels died upon the road; the load which the beast carried was immediately divided, and thrown upon the shoulders of the two slaves: Zadig had his share. Setoc smiled at seeing his two slaves crouching under their burthen. Zadig

took the liberty to explain the reason; and convinced him of the laws of the equilibrium. The merchant was astonished at his philosophical discourse, and looked upon him with a more favourable eye than at first.

Zadig, perceiving he had raised his curiosity, redoubled it, by instructing him in several material points, which were in some measure advantageous to him in his way of business: such as the specific gravity of metals, and other commodities of various kinds of an equal bulk; the properties of several useful animals, and the best means to make such as were wild, tame by degrees, and fit for service. Zadig indeed was looked upon by his master as a perfect oracle.

Setoc now thought the master much the better man of the two. He used him courteously, and had no cause to repent of his indulgence towards him.

Arriving at their journey's end, the first step that Setoc took, was to claim a debt of five hundred ounces of silver of a Jew, who had borrowed it in the presence of two witnesses; but both of them were dead; and as the Jew was conscious he could not be cast, for want of evidence, he appropriated the merchant's money to his own use, and rejoiced that it lay in his power for once to defraud an Arabian with impunity.

Setoc discovered to Zadig, who was now become his confident, the unhappy situation of his case.

"Where was it," said Zadig, "that you lent this large sum to that ungrateful infidel!"

"Upon a large stone," said the merchant, "at the foot of Mount Horeb!"

"What is the character of your debtor," said Zadig?

"That of a notorious villain," replied Setoc.

"That I suppose," said Zadig: "but is he a lively, active man; or is he dull, heavy, and plegmatic?"

"He is the worst pay master in the world," replied the merchant; "but the merriest, most sprightly fellow I ever met with."

"Very well!" said Zadig: "let me be one of your counsel when your cause comes to be heard!" Setoc consented, and summoned the Jew to attend the court; and Zadig thus opened the cause:

"Thou impartial judge of this court of equity, I come here in behalf of my master, to demand of the defendant five hundred ounces of silver, which he refuses to pay."

"Have you your witnesses to prove the loan?" said the judge.

"No, they are dead," answered Zadig; "but there is a large stone remaining, on which the money was deposited; and if your excellence will be pleased to order the stone to be brought into court, I doubt not but the evidence it will give, will be sufficient proof of the fact. I hope your excellence will order, that the Jew and myself should be obliged to attend the court till the stone comes, and I will dispatch a special messenger for it, at my master's expense."

"Your request is very reasonable," said the judge. "Do as you propose:" and so called another cause.

When the court was ready to break up, "Well!" said the judge to Zadig, "is your stone come?"

The Jew, with a sneer, replied, "your excellence may wait here till to-morrow, before the stone will appear in court: for it is above six miles off, and it will require fifteen men to remove it from its place."

"It is well!" replied Zadig. "I told your excellence that the stone would be a very material evidence. Since the defendant can point out the place where the stone lies, he tacitly confesses, that it was upon that stone the money was deposited."

The Jew, thus unexpectedly confuted, was obliged to acknowledge the debt. The judge ordered that the Jew should be tied fast to the stone, without meat or drink, till he should advance the five hundred ounces of silver, which were accordingly soon paid, and the Jew released. From that time the slave Zadig, and this remarkable stone witness, were in great repute throughout Arabia.

CHAPTER X.

THE FUNERAL PILE.

SETOC, transported with his success, made Zadig his favourite companion and confidant: he esteemed him as much, and found him as necessary in the conduct of his affairs, as the king of Babylon had in the administration of his government: and, fortunately for Zadig, Setoc had no wife.

He discovered that his master was benevolent, strictly honest, and a man of good understanding; but was concerned that a person whom he so highly esteemed should pay divine adoration to a host of created though celestial beings, according to the ancient custom of the Arabians, to the sun, moon, and stars.

He discoursed with his master, at first, with great precaution on so important a topic. But at last told him, in direct terms, that they were created bodies, and that there was no more adoration due to them than to a tree or a rock.

"But," said Setoc, "they are eternal beings, to whom we are indebted for all the blessings we enjoy; they animate nature; they regulate the seasons; and they are at such an infinite distance from us, that it would be impious not to adore them."

"You are more indebted," said Zadig, "to the waters of the Red Sea, which transport so many valuable commodities into the Indies. Why may they not be deemed as ancient as the stars? And if you are fond of paying your adoration on account of their vast distance, why do you not adore the land of the Gangarides which lies in the utmost extremities of the earth?"

"No," said Setoc; "there is something so surprisingly more brilliant in the stars than in what you speak of, that one is compelled to adore them."

At the close of the evening, Zadig fixed a long range of candles in the front of the tent, where Setoc and he were to sup. As soon as he perceived his patron at the door, he fell prostrate on his knees before the wax-lights. "O ye everlasting, ever-shining luminaries, be always propitious to your votary," said Zadig. Having repeated these words so loud as Setoc might hear him, he sat down to table, without taking the least notice of his patron.

"What!" said Setoc, astonished at his conduct; "Are thou at thy prayers before supper?"

"I act just as inconsistently, Sir, as you do," replied Zadig; "I worship these candles without reflecting on their makers, or yourself, who are my most beneficent patron."

Setoc comprehended the sense of this apology, and was conscious of the reproof that was concealed so delicately under a veil. The superior wisdom of his slave enlightened his mind; and from that hour he was less lavish than ever he had been of his incense to those created beings; and, for the future, paid his adoration to the eternal God, their Creator.

At that time there was a most horrid custom in high repute all over Arabia, which came originally from Scythia; but being established in the Indies by the sanction of the bigotted Brachmans, threatened to spread its infection all over the east.

On the death of a married man, if his dearly beloved widow ever expected to be deemed a saint, she was constrained to throw herself upon her husband's funeral pile. This was looked upon as a solemn festival, and was called the widow's sacrifice. That tribe which could boast of the greatest number of burnt widows, was looked upon as the most meritorious.

An Arabian, who was of the same tribe as Setoc, happened just at that juncture to die, and his widow, whose name was Almona, who was a rigid devotee, published the day, nay the hour, that she proposed to throw herself, according to custom, on her deceased husband's funeral pile, attended by a concert of drums and trumpets. Zadig remonstrated to Setoc, observing what a shocking custom this was, and how directly repugnant to human nature; by permitting young widows, almost every day, to become wilful self-murderers, when they might be of service to their country, either by the addition of new subjects, or by the education of such as demanded their maternal indulgence. And, by arguing seriously with Setoc, for some time, he forced from him, at last an ingenuous concession, that the barbarous custom then subsisting, ought, if possible, to be abolished.

"It is now," replied Setoc, "above a thousand years since the widows of Arabia have been indulged in this privilege of dying with their husbands; and how shall any one dare to abrogate a law thus consecrated by time? Is there any thing more inviolable than even an ancient error?"

"Reason," replied Zadig, "is of more ancient date than the custom you plead. Do you communicate these sentiments to the sovereigns of your tribes, and in the mean time, I will endeavour to discover the widow's inclinations."

He accordingly paid her a visit, and having insinuated himself into her favour, by compliments on her beauty; after urging what a pity it was that a young widow, mistress of so many charms, should destroy herself, for no other reason than that of mingling her ashes with a husband's that was dead, he notwithstanding, applauded her for her constancy and heroic fortitude. "I perceive, Madam," said he, "you were excessively fond of your deceased spouse."

"Not I, truly," replied the young Arabian devotee. "He was a tyrant, a wretch infected with a groundless and insupportable jealousy; but notwithstanding, I am determined to comply with our custom, and throw myself on his funeral pile."

"Surely then, Madam," said Zadig, "there is a sort of secret pleasure in being burnt alive."

"Alas!" cried Almona, with a sigh, "it is a shock to nature, but must be complied with. I am a professed devotee! and should I show the least reluctance, my reputation will be lost for ever: all the world would despise me."

Zadig having induced her ingenuously to confess that she parted with her life more out of regard to what the world would say of her, than out of pure love for the deceased, talked to her for some time so rationally, and used so many prevailing arguments to justify her due regard for the life which she was about to throw away, that she began to wave the thought, and entertain a secret affection for her friendly monitor.

"Tell me, Madam," said Zadig, "how would you dispose of yourself, upon the supposition that you should shake off this vain and barbarous notion?"

"Why," said the lady, with an amorous glance, "I verily think I should accept of thee for a second husband."

The Memory of Astarte had made too lively an impression on his mind to accept of this warm declaration. He took his leave, and immediately waited on the chiefs, to whom he communicated the substance of their private conversation, and prevailed with them to make it a law, for the future, that no widow should be allowed to fall a victim to a deceased husband, till she had admitted some young man to converse with her, in private, for an hour together. The law was passed accordingly; and not one widow in all Arabia, since that time, has observed the custom.

It was to Zadig alone that the Arabian dames were indebted for the abolition, in one hour, of a custom so very inhuman, and which had been practised a number of ages. Zadig, therefore, with the strictest justice, was looked upon by all the fair sex in Arabia, as their most bountiful benefactor.

CHAPTER XI.

THE SUPPER.

Setoo, who never went out without his bosom-friend, in whom alone, as he thought, all wisdom centered, resolved he should accompany him to Balzora fair, where the richest merchants, from all parts, used annually to resort.

Zadig was delighted to see such a concourse of substantial tradesmen, from all countries, assembled in one place. It appeared to him as if the whole universe was but one large family, and all happily assembled at Balzora.

On the second day of the fair, he sat down to table with an Egyptian, an Indian that lived on the banks of the river Ganges, an inhabitant of Cathay, a Celt, and several other foreigners, who, by their frequent voyages towards the Arabian Gulf, were so far conversant with the Arabic language, as to be able to discourse freely, and to be mutually understood.

"What an abominable place is this Balzora!" said the Egyptian, greatly exasperated, "where they refuse to lend me a thousand ounces of gold, upon the best security that can possibly be offered."

"What may the property be that you would deposit as a pledge for the sum you mentioned?" said Setoo.

"The corpse of my deceased aunt," said he, "who was one of the finest women in all Egypt. She was my constant companion in my journeys, but unhappily died upon the road. I have made her one of the choicest mummies we have amongst us, and was I in my own country, I could be furnished with whatsoever I pleased, were I disposed to mortgage it. It is a strange thing that no one here will advance so small a sum as a thousand ounces of gold upon so valuable a commodity."

Having thus expressed his resentment, he was proceeding to cut up a boiled fowl, when an Indian laid hold of his hand, and, with deep concern, cried out, "Consider what you are about!"

"About!" said the Egyptian; "I design to make a wing of this fowl one part of my supper."

"Good Sir, consider what you are doing," said the Indian. "It is very possible that the soul of the deceased lady may have taken its residence in that fowl; and you would not surely run the risk of devouring your aunt? To boil a fowl is, doubtless, a most shameful outrage done to Nature."

"What a noise you make about boiling a fowl, and flying in the face of Nature," replied the Egyptian, in anger. "Though we Egyptians pay divine adoration to the ox, yet we can make a hearty meal on a piece of roast beef."

"Is it possible, Sir, that your countrymen should act

so absurdly as to pay an ox the tribute of divine worship?" said the Indian.

"Absurd as you may think it, said the other, "the ox has been the principal object of adoration all over Egypt for a hundred and thirty-five thousand years, and the most abandoned Egyptian has never yet been so impious as to gain say it."

"Ay, Sir, an hundred and thirty-five thousand years, say you," replied the Indian. "Surely you must be out a little in your calculation. It is but about fourscore thousand years since India was first inhabited. I am certain we are a more ancient people than you, and our Brama prohibited the eating of beef long before your nation erected an altar in honour of the ox, or even put one upon a spit."

"What a disturbance you make about your Brama! Is he able to stand in competition with our Apis?" said the Egyptian. "Let us hear what mighty feats have been done by your boasted Brama?"

"He first taught his votaries to write and read," replied the Bramin: "and it is to him alone the world is indebted for the invention of the noble game of chess."

"You are quite mistaken, Sir, in your opinion," said the Chaldean, who sat near; "all these invaluable blessings were derived from the fish Oannes; and it is that alone to which the tribute of divine adoration is justly due. Every one knows that it was a divine being, whose tail was pure gold, whose head resembled that of a man; though indeed the features were much more beautiful; and that he condescended to visit the earth three hours every day, for the instruction of mankind. He had a numerous issue, as is well known, all of whom were powerful monarchs. I have a picture of it at home, to which, as in duty I ought, I say my prayers at night before I sleep, and in the morning when I rise.

"There is no harm, Sir, as I can conceive, in partaking of a piece of roast beef; but, doubtless, it is a horrid sin to touch a piece of fish. Besides, you cannot justly boast of so illustrious an origin, and you are both of you mere moderns, in comparison to the Chaldeans. The Egyptians claim no more than one hundred and thirty-five thousand years, and the Indians but eighty thousand, whereas we have almanacks that are dated four thousand centuries back. Rely upon it, I speak nothing but the truth! renounce your errors, and I will make each of you a present of a fine portrait of our Oannes."

The Chinese, or man of Cathay, entering into the debate, said, "I have a very great veneration not only for the Egyptians, Chaldeans, Greeks, and Celts, but for Brama, Apis, and the Oannes, but in my humble opinion the Li*, or, as it is by some called, the Tien,* is an object more deserving of divine adoration than the ox or the fish.

"I shall only remark, in regard to my native country, that it is of much greater extent than all Egypt, Chaldea, and the Indies put together. I shall lay no stress on the antiquity of my country, for I imagine it is of much greater importance to be the happiest people than the most ancient. However, since you were talking of the almanacks, I must take the liberty to inform you, that our's are esteemed the best all over Asia; and that we had several very correct ones before the science of arithmetic was ever heard of in Chaldea."

"You are all of you a set of illiterate, ignorant bigots," cried a Grecian: "it is plain you know nothing of the

* "Li" is a Chinese term, signifying natural light, or reason; and "Tien" the Heavens, or the Supreme Being.

Chaos, and that the world, as it is now stands, owing wholly to matter and form."

The Greek ran on for a considerable time, but was at last interrupted by a Celt, who, having drank deep during the whole time of this debate, thought himself much wiser than any of his antagonists, and, with a great oath, insisted that all their gods were nothing, if set in competition with the Teutath, or the misletoe on the oak. "As for my part, I carry some of it always in my pocket. My ancestors were Scythians, and the only men worth talking of in the world. It is true, indeed, they would now and then make a meal of their countrymen, but that ought not to be urged as any objection to the country; and if any one of you, or all of you, dare to speak disrespectfully of Teutath, I will defend its cause with my life."

The quarrel grew warmer and warmer, and Setoc expected that the table would be upset, or probably stained with blood.

Zadig, who had kept silence during the whole controversy, at last rose up, and addressed himself to the Celt, in the first place, as being the most noisy and outrageous.

"Sir," said he, "your notions in this affair are very just: oblige me with a piece of your misletoe." Then turning about, he expatiated on the eloquence of the Grecian, and softened in the most judicious manner all the contending parties. He said but little indeed to the Cathayan, because he was more cool and sedate than any of the others.

At length he addressed them in general terms, to this effect:

"My dear friends, you have been contesting all this while about an important topic, in which it is evident you are all unanimously agreed."

"Agreed!" cried they, in an angry tone. "How so?"

"Why," said he to the Celt, "is it not true that you do not in effect adore this misletoe, but that Being who created that misletoe, and the oak, to which it is so closely united?"

"Doubtless, Sir," replied the Celt.

"And you, Sir," said he to the Egyptian, "revere, through your venerable Apis, the great Author of every ox's being."

"We do so," said the Egyptian.

"The mighty Oannes, though the sovereign of the sea," continued he, "must give precedence to that Power who made both the sea and every fish that dwells therein."

"We allow it," said the Chaldean.

"The Indian and the Cathayan acknowledge one Supreme Being, or first cause, as well as you. What that profound, worthy old man, the Grecian, has advanced is, I must own, a little above my weak comprehension; but I am fully persuaded he will allow there is a Supreme Being, on whom his favourite matter and form are entirely dependent."

The Grecian, who was looked upon as a sage amongst them, said, with abundance of gravity, "that Zadig had put a just construction on his meaning."

"Now I appeal to you all," said Zadig, "whether you are not unanimous to a man, in the debate, and whether there are any just grounds for the least divisions or animosities amongst you?"

The whole company, cool at once, caressed him; and Setoc, after he had sold off all his goods and merchandize at a good price, took his friend Zadig home with him to the land of Horeb.

Zadig, upon his first arrival, was informed that a pro-

secution had been carried on against him during his absence, and the sentence pronounced against him was, that he should be burned alive before a slow fire.

CHAPTER XII.

THE RENDEZVOUS.

WHILE Zadig attended his friend Setoc to Balzora, the priests of the stars determined to punish him.

As all the costly jewels, and other valuable ornaments, in which the young widows, that sacrificed themselves on their husbands' funeral pile, were their customary fees, it is no great wonder they should be inclined to burn Zadig, for having so severely struck at the root of their interest. He was, therefore, accused of holding heretical and erroneous tenets, in regard to the Celestial Host. They deposed, that he had been heard to deny that the stars ever set in the sea.

This horrid blasphemy so astonished the judges, that they were ready to rend their mantles at the sound, and would have made Zadig, had he been a man of affluence, pay very severely for his heretical opinions. But, in the height of their compassion for even such an infidel, they would lay no fine upon him, but content themselves with roasting him alive before a slow fire.

Setoc, though without hopes of success, used all the interest he had to save his bosom friend from so shocking a death. They, however, turned a deaf ear to all his remonstrances, and obliged him to be silent.

The young widow Almona, who by this time was not only reconciled to live a little longer, but had some taste for the pleasures of life, and knew that she was entirely indebted to Zadig for it, resolved, if possible, to free her benefactor from the funeral pile, of the abuse of which he had fully convinced her.

She revolved her design in secret, without imparting it to any one. Zadig was to be executed the next day, and she had only the night in which she could save him. Her scheme for effecting this was as follows:—

To render her charms conspicuous and attractive, she decorated herself with great splendour, and made use of the choicest perfumes; and, thus attired, demanded an audience of the high priest of the stars. Upon her first admittance into his august and venerable presence, she addressed herself to him in the following terms:

"O thou first-born and well-beloved son of the great bear, brother of the bull, and first cousin to the dog, (these were the pontiff's high titles) I come to confess myself before you: my conscience is my accuser, and I am terribly afraid I have been guilty of a mortal sin, by declining the stated custom of burning myself on my husband's funeral pile? What could tempt me to a prolongation of my life, I cannot imagine? I, who am grown a perfect skeleton, all wrinkled, and deformed."

She paused, and pulling off, with a negligent but artful air, her long silk gloves, she displayed a soft, plump, naked arm, which for whiteness rivalled the snow.—"You see, Sir," said she, "that all my charms are decayed."

"Decayed, Madam!" said the lascivious pontiff; "no! your charms are still resistless." His eyes, and his mouth, with which he kissed her hand, confirmed their power. "Such an arm, by the great Orasmades, I never saw before!"

"Alas!" said the widow, with a modest blush, "My arm, Sir, perhaps, may have the advantage of any hidden part; but see, good father, what a neck is here; as yellow as saffron! An object not worth the least regard."

She then displayed the most snowy, panting bosom,

that Nature ever formed. A rose-bud on an ivory apple, if set in competition with her spotless whiteness, would have appeared like madder upon a shrub; and the whitest wool, just out of the laver, would seem but of a light brown hue.

Her neck, her large black sparkling eyes, that languishingly rolled with the lustre of a tender fire; her lovely cheeks, glowing with white and red; her nose, which resembled the tower of Mount Lebanon; her lips, which appeared like two borders of coral, inclosing two rows of the best pearls in the Arabian sea; such a combination, I say, of charms, made the old priest imagine he was scarce twenty years of age; and, in a kind of flutter, he began to make her a declaration of his tender regard. Almona, perceiving him enamoured, begged his interest in favour of Zadig.

"Alas! my dear charmer, my interest alone, when you request the favour, would be but a poor compliment; I will take care his acquittance shall be signed by three more of my brother priests."

"Do you sign first, however," said Almona.

"With all my soul," said the amorous priest, "provided—you will be kind, my dearest."

"You do me too much honour," said Almona: "but should you think proper to pay me a visit after sun-set, as soon as the bright star Sheat twinkles on the horizon, you shall find me, most venerable father, reposed upon a rose-coloured sofa, embroidered with silver, where you shall use your pleasure with your humble servant."

With that she made him a low curtesy; took up Zadig's general release, as soon as duly signed, and left the old dotard, full of love, though somewhat diffident of his own abilities.

He spent the remainder of the day in the bagnio; he drank large enlivening draughts of a water distilled from the cinnamon of Ceylon, and the costly spices of Tidor and Ternate, and waited with the utmost impatience for the rising of the brilliant Sheat.

In the mean time, Almona went to the second priest. He assured her that the sun, moon, and all the starry host of Heaven, were but languid fires to her bright eyes. He put the question to her, in short, at once, and agreed to sign upon her compliance.

She suffered herself to be over-persuaded, and made an assignation to meet him as soon as the star Angenib should make its appearance.

From him she repaired to the third and fourth pontiffs, taking care, wherever she went, to see Zadig's acquittance duly signed, and made fresh appointments at the rising of star after star.

When she had carried her point thus far, she sent a message to the judges of the court, who had condemned Zadig, requesting their attendance at her house, that she might advise with them upon an affair of the last importance. They waited on her accordingly, and she produced Zadig's discharge duly signed by four several hands, and told them the definitive treaty between all the contracting parties.

Each of the pontifical gallants observed their summons to a moment. Each was startled at the sight of his rival; but still more struck at seeing the judges before whom the widow had laid open her case. Zadig procured an absolute pardon; and Setoc was so charmed with the artful address of Almona, that he married her the next day.

Zadig went afterwards to throw himself at the feet of his benefactress. Setoc and he took their leave of each other with tears in their eyes, and vowed an eternal mutual friendship should be preserved between them; and

that should fortune at any time prove more propitious than could be expected to either party, the other should partake of an equal share of his success.

Zadig steered his course towards Syria; for ever pondering on the hard fate of the justly admired Astarte, and reflecting on his own stars, that so obstinately darted down their malignant rays, and continued daily to torment him.

"What," said he, "to pay four hundred ounces of gold for only seeing a dog pass by me; to be condemned to be beheaded for four trifling verses in praise of the king; to be strangled to death, because a queen was pleased to look upon me; to be made a prisoner, and sold as a slave, for saving a young woman from being grossly abused by a brute; and being upon the brink of being roasted alive, for no other offence than saving, for the future, all the widows in Arabia from becoming idle burnt offerings, and mingling their ashes with those of their deceased worthless husbands."

CHAPTER XIII.

THE ROBBER.

ZADIG, arriving at the frontiers which separate Arabia Petrea from Syria, and passing by a very strong castle, a party of armed Arabians rushed out upon him, and surrounding him, cried out: "Whatever you have belonging to you is our property, but your person is entirely at our sovereign's disposal."

Zadig, instead of replying, drew his sword: and his attendant being a man of courage, drew likewise. Those who first attacked them fell a sacrifice to their fury: their number redoubled; but Zadig and his servant were determined not to yield till death. When two men defend themselves against a whole gang, the contest doubtless cannot hold long.

The master of the castle, whose name was Arbogad, having beheld from his window, the intrepidity and surprising exploits of Zadig, greatly admired him. He descended therefore, in haste, and giving orders himself to his vassals to desist, delivered the two travellers out of their hands.

"Whatever passes over my territories," said he, and whatever I find that is valuable upon the premises of others, is my free booty; but, as you appear, Sir, to be a man of uncommon courage, you shall prove an exception to my general rule." He then invited Zadig into his magnificent mansion, and in the evening they supped together.

The lord of the mansion was one of those Arabians who are called free-booters; but a man who, amidst a number of bad actions, occasionally did a good one.

He plundered without mercy; but was liberal in his benefactions. In action he was intrepid; in traffic, easy; in his eating, a perfect epicure; and in his drinking an absolute debauchee; but in his disposition very frank and generous. Zadig pleased him extremely, so that his conversation prolonged the repast. At last, Arbogad said to him, "I would advise you to enlist yourself in my troop; you cannot do better. My profession is not a despicable one, and in time you may perhaps become as great a man as I am."

"May I presume," said Zadig, "to ask you one question—How long may you have followed this honourable profession?"

"From my youth," replied his host. "I was only a valet, at first, to an Arabian, who indeed treated me kindly; but servitude was a state of life to me insupportable. It exasperated me to see, in a wide world, which ought to be divided fairly between mankind, that fate

had reserved for me so scanty a portion. I communicated my grievances to an old sage Arabian.

"Son," said he, "do not despair: there was a grain of sand that lamented itself as a worthless atom of the deserts, but in process of time, it became a diamond, and is now the richest ornament of the Indian crown."

"The old man's discourse fired me with some ambition; I was conscious that I was at that time the atom he mentioned, and was determined if possible to become the diamond.

"At my first setting out I stole two horses; then I associated myself with a gang who stopped and robbed the small caravans; thus I gradually lessened the wide disproportion which there was at first between me and the rest of mankind. I enjoyed not only my share of the good things of this life, but was even recompensed with usury for my former sufferings. I was looked upon as a man of consequence, and I procured this castle by my military achievements. The satrap of Syria had intended to dispossess me; but I was then too rich to be afraid of him; I gave the satrap a sum of money, upon condition that I kept quiet possession of my castle. And at the same time, I aggrandized my domains; for he constituted me treasurer of the imposts that Arabia Petræa paid to the king of kings. I executed my trust in every respect as I ought, in the capacity of a collector; but I never did, nor ever intended, to balance my account.

"The grand desterham of Babylon sent hither, in the name of the king Moabdar, a petty satrap with a commission to strangle me. He and his attendants arrived here with his royal warrant; but I was apprised of the affair and accordingly ordered his whole retinue, consisting of four inferior officers, to be strangled before his face, after the manner of my intended execution.

"I then asked him what he thought the commission with which he was entrusted might reasonably be valued at; he answered, that he presumed his premium, had he succeeded, might have amounted to about three hundred pieces of gold. I made him sensible, that it would be for his interest to be a commissioned officer under me. I made him accordingly deputy free booter. He is at this day not only the best officer, but the richest I have in all my court. If my word may be credited, I will raise your fortune, as I have done his. There never was a better season for robbery than the present; for Moabdar is killed, and all Babylon is in the greatest confusion!"

"Moabdar killed, said you!" cried Zadig. "And what is become of his royal consort, Astarte?"

"I am ignorant of that," replied Arbogad. "All I know is, that Moabdar became a perfect madman, and was murdered! and that the people of Babylon are destroying one another, and that the whole empire is laid waste; and there is still an opportunity for making several bold strokes; and let me tell you, Sir, I have been pretty successful."

"But the queen, Sir," said Zadig: "pray favour me so far as to inform me if you know any thing of her majesty."

"I have heard something," said he, "of a certain prince of Hyrcania; it is very possible she may have listed herself among his concubines, if she had the good fortune to escape the resentment of those popular tumults; but my head is more devoted to plunder than to news; I have taken several ladies prisoners in the course of my excursions; but I seldom keep them; and such as are handsomer than ordinary, I make the best market I can of them, without enquiring who they are. Their quality or titles will fetch no price at all: a queen, if she is homely, is worth nothing. Perhaps I may have sold the queen, or she may be dead; but that it is of little

importance to me, and I suppose you have no more reason to trouble yourself about it than I have."

After this he drank so plentifully, that all his ideas were too much confused for Zadig to gain any farther information: he was struck dumb, confounded and remained motionless as a statue.

Arbogad continued drinking, told a number of merry stories, incessantly repeated that he was the happiest man alive, and invited Zadig to become as cheerful as himself. At length, being overcome by the fumes of his liquor, he sank into a profound sleep, while Zadig passed the night in the most violent agitations.

"What," said he, "the king then has lost his senses, he is slain! I cannot but lament his fate. The empire is torn to pieces, and yet this robber is happy! O Fortune! O Destiny! A man who lives by rapine is happy; and the most amiable creature that Nature ever framed has, perhaps, either suffered an ignominious death, or lives in a state worse than even death itself! O Astarte! O Astarte! what is become of thee?"

As soon as the day appeared, he went out, and enquired about Astarte of every one he saw. But the whole gang were too intent upon other matters to return him any answer. By virtue of their night's excursion, they had brought in some fresh booty and were busy in dividing the spoil.

All the favour he could procure, in their hurry and tumult, was a permission to depart without the least examination. He took the advantage of their remissness, and left the premises, but more overwhelmed with grief and deep reflection than ever.

Zadig, in his journey, was very restless and uneasy. His thoughts were for ever employed on the unfortunate Astarte; the king of Babylon; his bosom-friend, Cadore; the happy free-booter Arbogad; the fair coquette, that was taken prisoner on the confines of Egypt, by the Babylonian courtiers; in a word, on the various scenes of misfortunes and disappointments which he had successively experienced.

CHAPTER XIV.

THE FISHERMAN.

WHEN Zadig had travelled a few leagues from Arbogad's castle, he found himself on the banks of a little river, still continuing to deplore his unhappy fate, and looking upon himself as the most unfortunate man existing.

He perceived at a little distance a fisherman, reclined on a verdant bank, by the river side, trembling, scarce able to hold his net in his hand, which he seemed but little to regard, and with uplifted eyes imploring Heaven's assistance.

"I am certainly," said the fisherman, "the most unhappy wretch that ever lived! No merchant in all Babylon was ever so noted for selling cream cheeses, and yet I am ruined. No man ever had a more beautiful wife; but I have been treacherously deprived of her. I had still left a poor, pitiful cottage, but that I have seen plundered and destroyed, and am now immured in a cell: I have nothing to depend upon but my fishery, and not a single fish have I caught. Thou unfortunate net! I will never throw thee into the water more; sooner will I throw myself in."

The words were scarcely out of his mouth, but he started up, and ran to the river side, like one resolutely bent on finishing his wretched existence.

"Is it possible!" said Zadig. "Is there then a man in being more wretched than I?"

His resolution to save the poor man's life was as quick as his reflection. He ran to his assistance, and asked

him, with an air of pity and concern, the cause of his rash intention.

It is a trite remark, that a person is less happy when he has a companion in his misfortunes. But, if we may credit Zoroaster, this is not from a principle of malignity, but the effect of necessity; for we then find ourselves attached to an unfortunate person, as to our own likeness. The transport of a happy man would be a kind of insult; but two persons in distress are like two slender trees, which, by supporting each other, are fenced against the storm that blows around them.

"Why are you thus cast down?" said Zadig to the fisherman. "Never sink under the weight of your burthen."

"I cannot avoid it," said the fisherman. "I have not the least prospect of redress. I was once, Sir, the most considerable person in the whole village of Derlbach, near Babylon, where I lived, and, with the help of my wife, made the best cream cheeses in the Persian empire. Her majesty, the queen, Astarte, and the famous prime-minister, Zadig, were very fond of them. I served the court with about six hundred, and went the other day to receive my money; but, before I had got into the suburbs of Babylon, I was informed that not only the queen, but Zadig too, had privately left the court; whereupon I ran directly to Zadig's house, where I found the officers of the grand disterham plundering, by virtue of his majesty's mandate, all his effects, in the most loyal and orderly manner. From thence I made the best of my way to the queen's kitchen, where, applying myself to the steward of her household and his inferior officers, one of them told me she was dead; another, that she was confined in prison; a third, indeed, said she had made her escape by flight; all, however, assured me that my cheeses would never be paid for. From thence I went, with my wife, to Lord Orcan's, who was another of my court customers; of whom we begged for protection in our distress. The favour, I confess, was readily granted to my wife; but I was rejected. She was fairer, Sir, than the fairest cheese I ever sold; from whence I date all my misfortunes; and the bloom that adorned her blushing cheeks was ten times more lively than any Tyrian purple. For this reason Orcan detained her, and refused his protection to me. In the agonies of my despair, I wrote to my dear wife, who said to the bearer Oh! I have some little knowledge of this man: I have heard he makes excellent cream cheeses. Desire him to send some, and tell him I will take care he shall be paid."

"In my misfortunes, I determined to seek redress in a court of equity: I had but six ounces of gold left: two went for a fee to my counsellor; two to the solicitor who took my cause in hand; and the other two to the judge's clerk. Notwithstanding this, my cause was not yet begun; and I had already expended more money than all my cheeses and wife were worth. I returned therefore to my native habitation, with a full resolution to sell it for the ransom of my wife.

"My little cot, with the appurtenances, were worth about threescore ounces of gold; but as the purchasers found I was necessitous, the first whom I applied to offered me thirty ounces; the second twenty, and the third, but ten. Just as I came to terms of accommodation with one of them, the prince of Hyrcania came to Babylon, and laid all waste before him. My little cottage, with all its furniture, was first plundered of all that was valuable, and at last reduced to ashes.

"Having thus lost my money, my wife, and my house,

I withdrew to the desert. I have since endeavoured to procure a subsistence by fishing; but the fish, as well as all mankind, desert me. I scarcely catch one in a day; I am dying with hunger; and had it not been for your generous interposition, I had, ere this, perished in the river."

This long detail of particulars, was not delivered without several interruptions; "for," said Zadig, with great warmth and confusion, "have you ever heard what became of the queen Astarte?"

"No, Sir," said the disconsolate fisherman; but this I know, to my sorrow, that neither the queen, nor Zadig, ever paid me for my cream cheeses, that my dear wife is taken from me; and that I am driven to the very brink of despair."

"I am persuaded," said Zadig, "that you will not lose all your money. I have heard much of that same Zadig; he is reputed to be very honest; and if ever he returns to Babylon, he will discharge his debts with interest, like a man of honour. But, as for your wife, who appears to be not so very honest, I would advise you to take no farther trouble about her. Make the best of your way to Babylon. I shall be there before you. Make your applications to the illustrious Cador; tell him you met his friend upon the road; and stay there till I arrive. Observe my orders, and it is very probable it may turn out to your advantage.

"O puissant Orosmales," continued Zadig, "you have made me an instrument of comfort to this poor man; but what friend will you raise for me to alleviate my sorrows?" Having uttered this short expostulation, he gave the distressed fisherman a part of the money he had brought with him from Arabia.

The fisherman astonished and transported with joy at so unexpected a benefaction, kissed the feet of Cador's friend, and exclaimed, "Surely you are a messenger of heaven, sent down to save me."

In the mean time, Zadig frequently asked him questions, and wept as he asked them.

"What! Sir," said the fisherman, "can you, who are so bountiful a benefactor, be in distress yourself?"

"Alas!" said he, "friend, I am infinitely more unhappy than thou art."

"But pray, Sir," said the good man, "how can it possibly be, that he, who is so lavish of his favours, should be overwhelmed with greater misfortunes than the man he so generously relieves?"

"Your greatest uneasiness," replied Zadig, "arose from the narrowness of your circumstances; but mine proceeds from an internal and much deeper cause."

"Pray, Sir," said the fisherman, "has Orcan robbed you of your wife?"

This interrogatory put Zadig in a moment upon a retrospection of all his past adventures. He recollected the whole series of his misfortunes—commencing from that of the eunuch and the huntsman, to his arrival at the castle of Arbogad the free-booter.

"Alas!" said he to the fisherman, "Orcan, it is true, deserves severely to be punished; but, for the generality, we find such worthless barbarians are favourites of Fortune. Be that as it will, go as I bade you, to my friend Cador, and wait there till I come." They took their leave; the fisherman blessing his propitious stars; and Zadig cursing, every step he went, the hour he was born.

CHAPTER XV.

THE BASILISK.

As Zadig was traversing a verdant meadow, he perceived several young female Syrians, intent on searching for something that lay concealed, as they imagined, in the grass. He took the freedom to approach one of them, and asked her, in the most courteous manner, if he might have the honour to assist her in her researches.

"Take care," said she. "What we are hunting after, Sir, is an animal that will not suffer itself to be touched by a man."

"That is surprising," said Zadig. "May I be so bold as to ask what you are in search of, that shuns the touch of any thing but the hands of the fair sex?"

"It is, Sir," said she, "the basilisk."

"A basilisk, fair one!" said he. "And with what view are you searching after a creature so very difficult to be met with?"

"It is, Sir," said she, "for our lord and master Ogul, whose castle you see situated on the river side, at the bottom of the meadow. We are all his vassals. Ogul is in a very ill state of health, and his first physician has ordered him, as a specific, to eat a basilisk, boiled in rose-water: and as that animal is very hard to be caught, and will suffer nothing to approach it, but one of our sex, our sovereign Ogul has promised to honour her that shall be so happy as to catch it for him, so far as to make her his consort. This being the case, Sir, I hope you will not interrupt me any longer in the search, lest my rivals here in the field should happen to circumvent me."

Zadig withdrew, and left the Syrian ladies in quest of their imaginary booty, in order to pursue his intended journey. But as he came to the banks of a rivulet, at the remotest part of the meadow, he perceived another female, reclined on the grass, and entirely disengaged. Her stature seemed majestic, but her face was covered with a veil; and her eyes were fixed on the river, while the deepest sighs heaved from her bosom. In her hand she held a small wand, with which she was tracing out some characters on the dry sand, that lay between the flowery bank she sat on and the purling current.

Zadig's curiosity induced him, unperceived, to observe her operations at some distance. But approaching nearer, and perceiving very distinctly the first character to be the letter Z the next A and the third a D he started; but when he saw the additional capitals of I and G, his astonishment was too great for words to express. He stood for some time immovable; at last, in a soft faultering tone, he cried, "O generous lady, forgive a stranger, overwhelmed with sorrow, if he presumes to ask, by what amazing accident he finds the name of Zadig delineated by so lovely a hand."

At the sound of these words the fair one arose, and with a trembling hand lifting up her veil, and seeing Zadig, she uttered a cry of tenderness, surprise, and joy, till, sinking under the various emotions which at that instant agitated her soul, she fell senseless in his arms. It was Astarte herself; it was the queen of Babylon; it was the very goddess whom Zadig adored; whose hard fate he had so long deplored; and for whose sake he had felt so many agonizing pains.

For a few minutes Zadig stood senseless, and deprived of speech, his eyes fixed on Astarte, who, beginning to revive, cast a tender glance on him, attended with some confusion. "O ye immortal powers," cried he, "who preside over the destiny of frail mortals! have ye indeed restored me my Astarte! but alas! at what a conjuncture,

in what a place, and in what a state and condition do I view her!"

He threw himself prostrate on the ground, and kissed the dust of her feet. The queen of Babylon raised him up, and obliged him to sit by her on the flowery bank whereon she was reposed. Often did she endeavour to renew her discourse; but her tears and sighs as often interrupted her: she pressed him to relate the hardships he had undergone since their separation, and by what chance he traversed that solitary meadow; but, repeating question upon question, she prevented any answer.

At last, both of them having, in some measure, appeased the tumult of their souls, Zadig related in a few words the motives that brought him to that place."

"But tell me, O unfortunate, but ever-worthy queen," said he, "how it is I find you in this solitary place, dressed in this servile habit, accompanied by other female slaves, who are in quest of a basilisk, which, as I understand, is, by order of a celebrated physician, to be dissolved in rose-water, as a specific medicine for his dying patient?"

"While they are busy in their fruitless search," said the beautiful Astarte, "I will relate to you the sorrows I have undergone since last we parted; and since heaven has thus unexpectedly blessed me once more with the sight of my dear Zadig, I will no longer exclaim against my fate."

"You are not insensible, that the jealous king, my husband, was disgusted to find you the most amiable of all mankind, and that, for no other reason, he determined to strangle you and poison me. You know well too, that heaven inspired my little dwarf with artful means to give me timely notice of the rash resolutions of the king my husband."

"No sooner had the faithful Cadore obliged you to obey my orders, and to fly the court, but he ventured to enter my apartment in the dead of the night, through a private door. He snatched me up, and conveyed me directly into the temple of Orosmales, where the holy magus, who was his brother, locked me up in that august and awful statue that stands erect upon the pavement of the temple, and, Colossus like, touches the lofty ceiling with his head. There I lay concealed, or rather buried for some time; furnished with all the necessities of life by that venerable priest."

The king's apothecary at day-break entered my apartment, with a potion in his hand, composed of opium, black hellebore, aconite, and other ingredients still more baneful. Whilst this mercenary officer of the king's vengeance was thus employed, another, as inhuman as himself, went to your lodgings with the silken cord. Our flight, however, happily frustrated their design.

Cadore, the more artfully to deceive the king, accused us both as perfidious traitors, and informed him that you had taken your flight towards India; and that I was fled to Memphis. The guards were immediately ordered to pursue us both.

The couriers, who were sent after me, know nothing of my features, for, by the king's express orders, I had never exposed my face unveiled to any but yourself. Having no other marks to distinguish me but my stature, a young woman, just of my size, presented herself to their view on the frontiers of Egypt. She was found alone, and in a very disconsolate condition. They therefore entertained no doubt but this was the queen of Babylon; and therefore conveyed her instantly to my husband Moabdar. Their gross mistake at first incensed his majesty to the last degree: but, after having viewed her with an attentive eye, he found she was extremely beau-

tiful, and was reconciled. Her name was Missouf. I have been since informed, that her name, in the Egyptian language, signifies the *Fair Coquet*, a title to which she certainly had a just claim. She had, however, as much art as caprice; for she pleased the king of kings, and had such influence over him, that he made choice of her for his wife.

She now threw aside all disguise, and indulged in every caprice her vain imagination could suggest. She insisted that the chief of the magi, aged and diseased as he was, should dance before her; and on his refusal, she caused him to feel the effects of her resentment. She ordered his majesty's grand master of the horse to make her a pie of sweetmeats. He represented to her that he was no cook; a tart, however, he must make; and she discharged him for being so careless as to burn one corner of the crust. She gave his post to her favourite dwarf, and made her page the keeper of the great seal. Thus she reigned arbitrary; was the female tyrant of Babylon; and the people in general regretted my departure.

The king, who never acted the part of a tyrant till the moment he would have imprisoned me, and strangled you, seemed to have drowned all his good qualities in his dotage on this capricious woman. He came to the temple on the solemn festival of the sacred fire. I saw him prostrate on the pavement before the statue wherein I was enclosed, imploring the gods to shower down their choicest blessings on his beautiful Missouf.

"I, with an audible and distinct voice, addressed myself thus, like an oracle, to the king of kings." "The god disregards the prayers of a monarch, who is become a tyrant over his subjects; has sought the life of his innocent consort, and has suffered one to supply her place, who is distinguished only by her folly."

At these words the king trembled, and his brain became disordered. In a few days, through the conduct of Missouf, and the effect of the oracle, his reason entirely forsook him. This was the signal for revolt; the people arose, and ran to arms, and Babylon, that had so long indulged herself in indolence and ease, became the theatre of a sanguinary civil war.

I was now taken from my magnificent prison, in the hollow of the statue, and set at the head of a very powerful party. Your friend Cador hastened to Memphis, in hopes to find you there, and bring you back to Babylon.

The prince of Hyrcania, hearing of these intestine broils, came with a powerful army, in order to form a third party among the Babylonians. He attacked the king, who, with his fair, but fickle, Egyptian, fled before him. Moabdar, however, was so closely pursued, that he died of the wounds he received in his retreat; and Missouf became the fair victim of the conqueror.

As for my part, I had the misfortune to be overpowered likewise, and taken prisoner by an Hyrcanian party, who brought me into the presence of the young prince, at the moment Missouf stood before him. You will smile when I tell you the prince considered me as the most amiable captive of the two; but you will be distressed to hear, that my hard fate doomed me to be a vassal in his seraglio.

He then informed me, that as soon as he had concluded a military expedition, he would honour me with a visit. Judge the dreadful apprehensions I was under, upon his making such a declaration. My obligations to Moabdar were all cancelled, I had the opportunity of being the bride of Zadig and was fallen into the power of a barbarian.

I answered him with all the resentment becoming one

of my high character and exalted sentiments. I had always heard that heaven bestowed on persons of my rank such peculiar majesty and grandeur, that, with a bare word, or the glance of an angry eye, they could abash the pride of those rash beings who dared oppose their inclinations.

I spoke like a queen, but was treated like the most servile domestic. The haughty Hyrcanian, without ever condescending to address himself to me, turned to his black eunuch, and told him that I was very impertinent; but he thought me very handsome. He gave him therefore particular orders to take care of me, and put me under the same regimen as one of his favourites, in order that I might recover my colour, which was somewhat too languid, and that I might become worthy of his royal favours, and be qualified to receive him, when he should honour me so far as to fix the day. I told him, I would rather suffer death. He replied, with a sneer, that life was a blessing too valuable to be thrown away; that young women, like me, seldom killed themselves; and that they were made for enjoyment. He then left me with as much carelessness, as if he had shut up a parrot in her gilded cage. What a shocking state for the first queen of the universe! Nay, I will say more, for a heart that was wholly devoted to Zadig!

At these endearing words, Zadig prostrated himself at her feet, and bathed them with his tears. Astarte immediately raised him in the most courteous manner, and thus continued her narration.—"I too plainly perceived that I was subject to the tyranny of a barbarian, and the rival of a coquet, that was a slave like myself. She related to me all her past adventures in Egypt.

"From the description she gave of her gallant, the time and place, the dromedary on which he was mounted, and from every other minute circumstance, I imagined it was Zadig that fought for her." As I had no doubt but that you resided somewhere in Memphis, I determined to retire there. Beateuse Missouf, said I, "you are of a much sprightlier disposition than I; you will be able to amuse the gay young prince of Hyrcania much better than I shall. Find out some way therefore for my escape; you will then reign alone, and while you render me happy, you will be exempt from the fear of a rival." Missouf agreed to my measures; and I took my departure, with no other attendant than an old Egyptian slave.

"No sooner had I reached the borders of Arabia, than a notorious free-booter, named Arbogad, seized me, and sold me to some merchants, who conveyed me to this castle, the residence of the Emir Ogul, whence I was purchased without being known. He is a perfect debauchee; and imagines that the Almighty sent him into the world for no other purpose, than to gratify his sensual appetites. He is so excessively corpulent, that he is in continual danger of suffocation. His physician can persuade him to take any thing for his relief; though he laughs at him, and despises his advice when he is well. He has intimated to him, that at present his life is in danger, and nothing can save him but a basilisk boiled in rose-water. The grand Ogul has therefore promised his last favours to that slave who shall first procure him a basilisk. You see I leave others to struggle for the honour proposed; and I never had less inclination to find out the basilisk than at present, since I have once more met with my dearest Zadig."

After this declaration, Astarte and Zadig renewed with warmth the virtuous affection which they had long conceived for each other; and reciprocally uttered the tenderest expressions that love in distress could devise. And the genii, who preside over all the soft passions, wafted

their mutual vows of eternal constancy and truth to the sphere of Venus.

The train of slaves returned to Ogul, having searched in vain for the basilisk. Zadig was introduced to this illustrious prince, and addressed him to this effect.

"May immortal health descend from heaven to preserve a life so precious as yours. I am a physician; I hastened to your palace, on the first news of your dangerous situation, and have brought with me a basilisk distilled in rose water. As I can have no benefit from the high reward you have offered, in case I succeed in my application: all the favour I request, is the release of one of your Babylonish slaves, who has been in your highness's retinue for a short time. And I am willing to be your slave in her stead, if I fail of restoring the most illustrious and potent Ogul to his pristine state of health."

The proposal was accepted. Astarte was instantly discharged, and set out for Babylon, with a proper attendant according to Zadig's direction. Their parting was affectionate, tender and expressive of the strongest obligations to each other.

The moments of meeting, and those of parting, are according to the book of Zend, the two most remarkable epochs of a lover's life. Zadig's affection for the queen and the queen's love for Zadig, had made a deeper impression on her heart than she thought proper to discover.

In the mean time, Zadig again addressing himself to Ogul: "my basilisk, Sir, is not to be eaten; all its virtues must penetrate through your pores; I have inclosed it in a bladder, full-blown, and carefully covered with the softest leather. You must kick this bladder, Sir, once a day, about your hall for a whole hour together, with all possible vigour and activity. This exercise must be repeated every morning, and I will attend the operation: upon your due observance of the regimen I shall prescribe to you, I doubt not, but with the blessing of heaven, I shall give you ample demonstration of my skill in physic."

Ogul on the first experiment, was ready to expire with fatigue and loss of breath. The second day he was less fatigued, and slept better at night. In short, in about eight days, our doctor performed an absolute cure. His patient recovered all the strength and vigour, that he enjoyed in the bloom of youth.

"Now, Sir," said Zadig "I will be ingenuous with you, and disclose to you the important secret. You have played at foot-ball these eight days; and you have lived, during that time, within the bounds of sobriety and moderation. Know, Sir, that there is no such animal in nature as a basilisk; that health is to be secured by temperance and exercise; and that the art of making health consistent with luxury is impracticable, and, in all respects, as idle and chimerical, as those of the philosopher's stone, judicial astrology, or the theology of the magi."

Ogul's former physician, apprehensive that this unexpected cure, thus wrought by a stranger, through such an anti-medicinal preparation, might possibly not only render himself the object of contempt in the eye of his great master, but cast a stigma on his whole fraternity, convened a set of petty doctors and apothecaries, who were his vassals, and entirely devoted to his interest, to find out some means to cut off in private his dreadful rival; but while they were concerting their wicked plot, Zadig received a message by a courier from the queen Astarte.

CHAPTER XVI.

THE TOURNAMENTS.

THE queen was received at Babylon with all those transports of joy usually felt in favour of injured beauty and innocence. This city was now perfectly tranquil. The young prince of Hyrcania had been slain in battle; and the victorious Babylonians declared that Astarte should wed such person as they might chose to appoint their sovereign.

They were determined that the first office in the world that of Royal Consort to Astarte, and King of Babylon, should not be obtained by party faction, or court intrigue but should depend on superior value and distinguished wisdom.

A circus was marked out, a small distance from the city, and surrounded by a commodious amphitheatre. Thither the combatants were to repair completely armed. Each had a distinct apartment behind the amphitheatre, by which means his person could not be known. They were to enter the lists four times; and those who vanquished four knights, competitors, were afterwards to engage each other in single combat, in order that he who should remain master of the field should be proclaimed the conqueror.

Four days after they were to meet again, armed as before, and to explain such enigmas as the magi should think proper to propose; and if they could not explain them, they were again to enter the lists, till a person should be found who was triumphant in both these contests; for it was their determinate resolution, to have a king of the greatest valour, and the most consummate understanding.

The queen all this time was to be strictly guarded, and only permitted to be a distant spectator, covered with a veil; but was not to converse with the competitors, so that they might neither receive favour nor suffer injustice.

Astarte found means to acquaint her lover of all these preliminary articles, doubting not, on such an occasion, of the most gallant display of his superior courage and wisdom. Zadig accordingly set out for Babylon, imploring Venus not only to fortify his courage, but to enlighten his understanding.

On the eve of this great day Zadig arrived on the banks of the Euphrates. He inscribed his device among the list of combatants; concealing his person and name as the laws of the election required; and then withdrew to the apartment allotted him.

His friend Cador, who was just returned to Babylon, after a fruitless search for Zadig in Egypt, sent a complete suit of armour into his lodge, which was a present from the queen, and also one of the finest horses in Persia. Zadig was convinced these presents came from the queen, and was thereby animated with fresh vigour and more sanguine hopes.

The next day the queen being seated under a canopy of jewels, and the amphitheatre filled with all the people of rank in Babylon, the combatants appeared in the circus and each advancing towards the chief grand magi, deposited his device at his feet. They were drawn by lot, and Zadig's happened to be the last.

The first that advanced was a nobleman, of the name of Itobad, very rich and vain, but a stranger to real courage; very awkward, and a man void of mental accomplishments.

His attending sycophants flattered him, that so worthy a man as he could not fail of victory: and he himself imperiously said, "A man of so much merit as I am must be king:" upon which they armed him cap-a-pee. His

armour was made of pure gold, enamelled with green. He had a grand plume of feathers, and his lance was ornamented with green ribbands.

When the spectators saw the manner in which Itobad managed his horse, they were persuaded he was not destined to sway the sceptre of Babylon. He was thrown out of his saddle by his first combatant. The second threw him entirely over the horse's crupper, and laid him extended on the ground, with his legs shaking in the air.

Notwithstanding this ill success Itobad remounted, but in so awkward a manner, that the whole amphitheatre resounded with laughter. The third, disdaining to use his lance, made only a feint at him; then catching hold of his right leg, and whirling him round, threw him flat on the sand. His attendants flew to his assistance, and with a sneer, remounted him. The fourth combatant caught hold of his left leg, and unhorsed him again.

He was conveyed, with scornful shouts from the hissing multitude, to his lodge, where he was to pass the night, agreeable to the law in that case provided. In his way there, he said, "what an unfortunate adventure is this to one of my character and birth!"

The rest of the combatants acquitted themselves with more credit. Some conquered two antagonists, and others three. Prince Otamus, was the only one who vanquished four.

Zadig, at last, entered the lists, and alternately dismounted all his four opponents with the utmost ease, and in so graceful a manner, that he was universally admired.

The case standing thus, Zadig and Otamus were to end the day's entertainment in single combat. The latter's armour was of a blue colour, mixed with gold, with a plume of the same colour. Those of the former were white.

The spectators were divided in their wishes. Astarte who was in a dreadful uncertainty, put up her secret prayers to the Goddess Venus for her beloved Zadig.

These two heroes made their passes and vaults so dexterously, and remained so firm in their saddles, giving each other such repulses with their lances, that every one present, except the queen, wished for two kings of Babylon. Their horses being now tired and both their lances broken, Zadig made use of the following stratagem, of which prince Otamus was not apprized.

He passed artfully behind his antagonist, sprang nimbly upon his horse, seized the knight in his arms, threw him to the earth, then jumped into his seat, and wheeled round him, while he lay extended on the ground. On this the whole amphitheatre exclaimed, "Victory! Victory!" in favour of the champion in white.

Otamus, greatly enraged, arose, and drew his sword. Zadig sprang from his horse with his sabre in his hand. Now behold the two chieftains commencing a fresh trial of their skill, where each alternately had the advantage; for both were strong, and both were active.

The feathers of their helmets, the studs of their bracelets, their coats of mail, flew about in pieces, occasioned by the furious blows which they repeated a thousand times. Sometimes they struck at each other with the edge of their swords, at other times they thrust with their points. Now on the right, then on the left; now on the head, then at the breast: they retreated, they advanced; they kept at a distance, they closed again; they grasped each other; turning and twisting like two serpents; and engaged each other with the fierceness of two Lybian lions fighting for their prey; their swords striking fire at every blow.

At last, Zadig, to recover his breath, paused for a moment, and afterwards, making a pass at the prince, threw him on his back, and disarmed him. Zpon this Otamus cried out, "Thou alone, O knight of the white armour, are destined to be blest with the crown of Babylon."

Astarte was transported with joy. The two champions were re-conducted to their separate apartments, agreeable to the laws prescribed. Several mutes were ordered to attend the combatants, and furnish them with proper refreshment. It may be easily imagined that her majesty's dwarf was appointed to wait on Zadig.

Supper being ended, the mutes withdrew, and left the combatants to rest their wearied limbs till the next morning; when the victor was to produce his device, before the principal of the magi, in order to compare notes, and discover the victor.

Zadig being fatigued with his day's labour, slept very soundly, notwithstanding his affectionate regard for Astarte. Itobad, who lodged in the apartment next to his, could not compose himself to rest, so much was he mortified at his ill success. He arose therefore in the middle of the night, stole imperceptibly into Zadig's apartment, and carrying off his white armour and device, left his green one in its place.

At day break, he went boldly to the principal of the magi, to declare himself the potent hero, the thrice happy conqueror. Accordingly he gained his point, and was proclaimed victor before Zadig awoke. So unexpected a disappointment greatly dispirited the queen, and she returned to the Babylonian court filled with melancholy and despair.

The greatest part of the company had left the amphitheatre before Zadig arose from his bed. He searched every corner of the room for his arms; but could not find none but those in green, which he was obliged, though much against his inclination, to put on, having nothing else to appear in.

Confounded, and swelled with resentment, he drest himself, and in that despicable equipage made his appearance. The people who remained in the circus received him with hootings and hisses; they made a ring about him, and treated him with every mark of ignominy and contempt.

He could bear their insults no longer, and therefore cut his way through the mob with his rivals sabre; but he knew not what measures to pursue, or how to rectify so dreadful a mistake.

He could not procure a sight of Astarte, nor could he reclaim the white armour he received from her; that being the compromise, to which the combatants had all agreed. Thus he was on the one hand plunged in an abyss of sorrow, and on the other almost distracted with vexation and resentment.

In this solitary state, he withdrew to the banks of the Euphrates, fully persuaded that his unlucky star had shed its most baleful influence on him, and that his misfortunes were irretrievable, revolving in his mind all his disappointments, from his first adventure with Semira, who had such an aversion to every person that had but one eye, to the late loss of his white armour.

"How severely," said Zadig, "have I experienced the fatal consequences attendant upon a sluggard! If I had been more watchful, I had been Astarte's blessed consort, and been happy in her tender embraces. All the knowledge of books or mankind, all the personal bravery that I can boast of, has only proved an aggravation of my sorrows."

He at last carried his reflections so far as to repine at

the unequal dispensations of Divine Providence: and even began to imagine that all occurrences were governed by a malignant deity, which continually oppressed the virtuous, and crowned the actions of such miscreants as the knight in green with success.

In one of his frantic fits he dressed himself in this unhappy armour, which had gained him so many enemies; and a merchant accidentally passing that way, he sold it to him for a trifle, taking in exchange nothing more than a mantle and a cap.

In this dress he walked along the banks of the Euphrates filled with the deepest sorrow, and reflecting on Providence for involving him in so many afflictions.

CHAPTER XVII.

THE HERMIT.

As Zadig was ruminating and rambling along, he met with a hermit, whose white and venerable beard descended to his girdle, and whose attention seemed fixed on a book he held in his hand. Zadig approached with profound obeisance, and the hermit returned the compliment with such an air of majesty and benevolence, that Zadig's curiosity prompted him to converse with him.

Addressing the venerable stranger, "Sir," said he, what may be the contents of the treatise you are reading with such attention?"

"It is the Book of Fate," said the hermit: and asking him if he wished to peruse it?—he put the book into the hands of Zadig, who, though a perfect master of several languages, could not decipher a single character. This raised his curiosity still higher.

"You seem dejected," said the good father to him.

"Alas! I have sufficient cause," said Zadig.

"If you will permit me to accompany you," said the hermit, "perhaps I may be of service to you. I have sometimes administered consolation to the minds of the afflicted."

Zadig entertained a great regard for the air, the beard, and the book of this venerable old man. He found him the most learned person he had ever met. He discoursed on destiny, justice, morality, the sovereign good, the frailty of nature, on virtue and vice, with such persuasive eloquence, that Zadig was attached to him by an irresistible charm. He begged he would favour him with his company to Babylon.

"That favour I was going to ask myself," said the hermit.

"Swear, by Orosmales, that whatever I do you will not leave me, for some days at least."

Zadig took the oath, and they pursued their journey together.

The two travellers arrived that evening at a superb castle. The hermit entreated an hospitable reception for himself and his young comrade. The porter, who might have been mistaken for a lord, admitted them with a kind of disdainful air, and conducted them, however, to the head steward, who showed them his master's magnificent apartments.

At supper the two travellers were seated at the lower end of the table, where they were served with as much delicacy and profusion as any of the other guests, but received no marks of attention from the host. When they arose from table, they washed their hands in a golden bason, set with emeralds and rubies. At last, they were conducted into a bed-chamber richly furnished; and the next morning, two pieces of gold being presented to them, they were dismissed.

"The proprietor of this castle," said Zadig, as they

were upon the road, "appears to be a very hospitable man; though somewhat haughty, and too imperious."

No sooner had he uttered these words, than he perceived the pocket of his comrade's garment, though large, much swelled, and greatly distended; and upon viewing it more nearly, he discovered he had brought away the golden bason.

He feared to take notice of the fact, but the thought of it gave him much concern.

At noon, the hermit knocked with his staff at the door of a little cottage, the apparent residence of an old rich miser, and desired that he and his companion might refresh themselves there for a few hours. An old servant let them in, with apparent reluctance, and showed them into the stable, where all their fare was a few musty olives, and a draft of sour beer.

The hermit seemed as contented with his repast as he was the night before.

At last, rising from his seat, he paid his compliments to the old servant, (who narrowly watched them the whole time, and frequently pressed them to depart), and gave him the two pieces of gold he had received that morning, as a token of his gratitude for his hospitable entertainment. Adding, "I would willingly speak with your master before I go."

The servant complied with his request. "Most hospitable Sir," said the hermit, "I could not depart without returning you my grateful acknowledgement for the friendly reception we have met. Please to accept this golden bason, as a small token of my gratitude and esteem."

The miser started, and was ready to fall at the sight of so valuable a present; but the hermit leaving him to recover of his surprise, immediately departed with his young comrade.

"Father," said Zadig, "What have I seen? You seem to act in a manner different from the generality of mankind. You take from him who entertained you with profusion, and give to a covetous wretch, who treated you with indignity."

"Son," replied the old man, "this vain lord, who receives strangers with no other view than to gratify his pride, will henceforward learn to be wiser; and the miser, in future, will show the traveller more hospitality: be not surprised, but follow me."

Zadig was at a loss to determine whether his companion was a man of greater wisdom than ordinary, or a madman. But the hermit spoke with such an authoritative air, that he knew not how to leave him.

At night they came to a house very commodiously built, but neat and plain, without the appearance of either want or profusion. The master was a philosopher, that had retired from the busy world, to live in peace, and form his mind to wisdom and virtue.

He built this little house for the reception of strangers, in an hospitable manner, but without ostentation.

He went himself to introduce the two travellers, and conducted them to a commodious apartment, where he desired them to rest themselves.

In a short time he invited them to a frugal, yet elegant repast; during which he talked very intelligently about the late revolutions in Babylon. He seemed to be entirely in the queen's interest, and heartily wished that Zadig had entered the list for the regal prize; "But Babylon," said he, "does not deserve a king of so much merit."

A modest blush appeared in Zadig's face at this unexpected compliment, which served only to remind him of his misfortunes.

It was agreed, that the affairs of this world took sometimes a different turn to what the wisest men would wish them.

The hermit replied, "the ways of Providence are intricate and obscure, and mortals err in judging of the whole upon the bare imperfection of the minutest parts."

Their next topic was the passions. "Alas!" said Zadig, "how fatal in their consequences!"

"They are the winds that swell the sails of the vessel," replied the hermit. "Sometimes, it is true, they overset it; but there is no sailing without them. The bile makes us peevish and sick, but there is no living without it. Though every thing here below is dangerous, yet every thing is necessary."

Their discourse was turned on pleasures; and the hermit demonstrated that they were the gifts of heaven; arguing that man cannot bestow either sensations or ideas on himself; but must receive them all, as well as his being, from a superior cause.

Zadig was astonished that a man, who had committed such vile actions, could argue so well on morality.

At last, after a pleasing and instructive conversation, their host conducted them to their bed-chamber, thanking heaven for directing two strangers of so much wisdom and virtue to his house.

He offered them money to defray their expences on the road, but with such air of respect and benevolence, that it was impossible to give the least disgust.

The hermit, however, refused it, and took his leave, as he proposed to depart early in the morning for Babylon.

Their parting was very affectionate.

Zadig, in particular, expressed a more than common regard for a man of so amiable a disposition.

"When the hermit and he were alone, they passed much time in bestowing praises on the new host.

At break of day, the hermit, waking his comrade, said, "It is time to be gone; but as all in the house are fast asleep, I will leave a token behind me of my respect for the master of it."

No sooner had he uttered these words, than he set the building in a flame.

Zadig, in the utmost consternation, shrieked, and would have prevented him.

The hermit, however, dragged him away by a superior force, and the house was soon in a blaze.

When they had reached a convenient distance, the hermit, with an amazing serenity, turned back, and surveyed the destructive flames. "Behold," said he, "our fortunate friend! In the ruins he will find an immense treasure, that will enable him henceforth to exert his beneficence, and render his virtues more and more conspicuous."

Zadig was now tempted at one and the same instant, to ridicule, to reproach, to chastize, and leave the reverend Father, but, subdued by the authority he had assumed, he attended him to the next stage, which was the cottage of a virtuous widow, who had a nephew about fourteen years of age. This youth was the darling of her heart.

She entertained her two guests in the best manner her little house afforded.

In the morning she ordered her nephew to attend them to an adjacent bridge, which, having been lately broken, rendered the passage dangerous to strangers. The youth, being very attentive, went foremost.

As they were on the middle of the bridge, "Come hither, my little boy," said the hermit. "I must show my gratitude to your aunt for her last night's favours."

He then seized him by the hair, and, with great calmness, threw him into the river.

The youth sunk, arose again to the surface, but was soon lost in the stream.

"O monster! O villain!" cried Zadig.

"Did not you promise," said the hermit, "to view my conduct with patience? Know then that under the ruins of that house, which Providence has consumed by fire, the master has found immense treasure, which will enable him to exert his beneficence: Learn also, that this youth, whom Providence has taken away by an untimely death, had he lived, another year, would have been the murderer of his aunt."

"Who told you so, barbarian?" said Zadig: "and when did you read that inhuman event in your black Book of Fate? Who gave you permission to drown so innocent a youth, who never did you injury?"

While Zadig was thus exclaiming, he observed the old man's beard vanish, and that his face discovered the traces of blooming youth; the hermit's habit disappeared, and four angelic wings covered a majestic form resplendent with light.

"O thou messenger of heaven! O thou angelic form!" cried Zadig, and fell prostrate at his feet, "thou art descended from the Empyrean to instruct a poor frail mortal how to submit to the orders of the Eternal."

"Man," said the angel Jefrad, "judges of the whole, only viewing a part. Thou, of all the human race, most deserves to have thy mind enlightened."

Zadig begged leave to speak. "I am diffident of myself," said he; "but may I presume, Sir, to beg the solution of one scruple? Would it not have been better to chastise the youth, and by that means reform him, than to have cut him off thus unprepared?"

Jefrad replied, "Had he been virtuous, and had he lived, it was his fate not only to have murdered himself, but his wife, and the little infant that was to have been the pledge of their mutual affection."

"Is it necessary then, venerable guide," said Zadig, "that there should be wickedness and misfortunes in the world, and that those misfortunes should fall with weight on the heads of the righteous?"

"The wicked," replied Jefrad, "are always unhappy. Misfortunes are intended only as a touchstone, to try a small number of the just, thinly scattered about the earth, nor is there any evil from which some good does not proceed."

"But," said Zadig, "suppose there was only good, and no evil?"

"Then," said Jefrad, "this world would be another world; the chain of events would be another arrangement conducted by wisdom; and that other order, which would be perfect, must of necessity be the everlasting residence of the Supreme Being, whom no evil can approach. He has created an infinite number of worlds, and no two of them alike. This vast variety is an attribute of his divine Omnipotence. There are no two leaves on the trees of the earth, nor any two globes of light amongst the myriad of stars that deck the infinite expanse of heaven, which are perfectly alike. And whatever you see on that small atom of earth, whereof you are a native, must exist in the place, and at the time appointed according to the immutable decrees of him who comprehends the whole.

"Mankind imagine, the youth whom I plunged into the river was drowned by chance! and that our generous benefactor's house was reduced by chance; but know there is no such thing as this chance or accident; all misfortunes are intended either as severe trials, judg-

ments, or rewards; and are the result of foreknowledge.

"You remember the poor fisherman, who thought himself the most unhappy of mortals. The great Orasmades sent you to amend his situation. Frail mortal! cease to contend with what you ought to adore!"

"But," said Zadig—While the sound of the word but dwelt upon his tongue, the angel took his flight towards the tenth sphere.

Zadig sunk down upon his knees, with the profoundest submission to an over-ruling Providence.

The angel, as he soared towards the clouds, exclaimed, "Proceed to Babylon."

CHAPTER XVIII.

THE ENIGMAS.

ZADIG, like a man deprived of his senses by loud peals of thunder, wandered at random. He entered, however, into the city of Babylon on the day those combatants who had been engaged in the circus were assembled in the spacious outer-court of the palace, in order to solve the enigmas, and give the most proper answers they could to such questions as the magi should propose.

All the knights were present, except the knight of the green armour.

The moment Zadig made his appearance in the city, the people assembled round him. They were not satisfied with gazing on him; all were lavish of their praises, and in their hearts wished him their sovereign.

The envious man, who saw him pass, sighed, and turned his head aside.

The populace, with loud acclamations, attended him to the palace gate.

The queen, who had heard of his arrival, was greatly agitated by alternate hope and despair. She could neither conceive why Zadig should appear without his accoutrements, nor imagine by what means Itobad could procure the white armour.

At the sight of Zadig, a confused murmur ran through the whole place. Every eye was surprised, though charmed, to see him; but none were admitted into the assembly-room except the knights who had fought.

"I have fought as successfully as any one of them!" said Zadig; "though another appears clad in my armour: but, before I can prove my assertion, I demand admission into court, to give my solutions to such enigmas as shall be produced."

His demand was put to the vote; and his strict honour and veracity were so strongly imprinted on their minds, that it was carried in the affirmative, without opposition.

The first question the principal of the magi proposed was this:

"What is the longest and yet the shortest thing in the world; the swiftest and the most slow; the most divisible, and the most extended; the least, valued and the most regretted; without which nothing can be done; which devours every thing, however small, and yet gives life and spirit to every object however great?"

Itobad replied, that a man of his merit had something else to think on than idle riddles; it was enough for him, that he was acknowledged the *hero* of the circus.

One said, the solution of the *enigma* proposed was *Fortune*; others said the *Earth*; and others the *Light*; but Zadig pronounced it to be *Time*.

"Nothing," said he, "can be longer, since it is the measurement of eternity; nothing is shorter, since *Time* is always wanting to accomplish what we aim at. Nothing passes so slowly as *Time* to him who

is in the perfect enjoyment of his wishes. Its extent is to infinity, in the whole; and divisible into infinite smallness. All men neglect it, and all regret its loss; nothing can be done without it; it buries in oblivion whatever is unworthy of being transmitted to posterity; and it renders illustrious actions immortal."

The assembly agreed unanimously that Zadig was in the right.

The next question was:—

"What is the thing we receive, without ever being thankful for it; which we enjoy without knowing how we came by it; which we give away to others without knowing where it is to be found: and which we lose, without being conscious of our misfortune?"

Every one gave his explanation.

Zadig was the only person that concluded it was *LIFE*.

He solved every *enigma* that was proposed with equal facility.

Itobad, when he heard the explication, always said that nothing in the world was more easy than to solve such obvious questions; and that he could interpret a thousand of them without the least hesitation, were he inclined to trouble his head about such trifles.

Other questions were proposed in regard to justice, the sovereign good, and the art of government.

Zadig's answer still carried the greatest weight.

"What a pity it is," said some who were present, "that one of so comprehensive genius should make so bad a knight!"

"Illustrious lords," said Zadig, "I had the honour of being victor at your circus; the white armour was mine. That awkward warrior, Lord Itobad, stole it while I slept. He imagined it would do him more honour than the green. Unaccoutred as I am, I am ready, before this august assembly, to give them incontestible proof of my superior skill; to engage with the usurper of the white armour with my sword only, in my mantle and bonnet; and to testify that I only was the happy victor of the justly admired Otamus."

Itobad accepted the challenge with assurance of success. His head being guarded by a helmet, his breast and back by his cuirass, and his arms by his brassards, he doubted not but he should be able to subdue an antagonist in his mantle and no weapon of defence but a sabre.

Zadig drew his sword, and saluted the queen, who viewed him with transport mixed with fear. Itobad drew his without any salutation. He approached Zadig, as one whom he imagined incapable of making any considerable resistance. He concluded it was in his power to cut Zadig in twain.

Zadig, however, received his adversary's blow on the strongest part of his sword, by which means Itobad's sword was broke in two. Zadig upon this closed his adversary, and, by his superior strength and skill, laid him on the ground, and holding the point of his sword to the opening of his cuirass, "Submit to be stript of your borrowed plumes, or you are a dead man."

Itobad, always surprised that any disappointment should attend a man of such exalted merit as himself, very tamely permitted Zadig to rob him by degrees of his pompous helmet, his superb cuirass, his rich bracelets, his brilliant cuisses, and other martial accoutrements.

When Zadig had equipped himself in his new recovered armour, he flew to Astarte, and threw himself prostrate at her feet.

Cador proved that the white armour was Zadig's property. He was thereupon acknowledged king of Baby-

lon, by the unanimous consent of the whole court; but more particularly with the approbation of Astarte, who, after such a long series of misfortunes, had the supreme happiness of seeing her beloved Zadig thought worthy, in the opinion of the whole kingdom, to be the partner of her royal bed. Itobad withdrew, and contented himself with being called my lord within the narrow compass of his own domestics.

Zadig was elected king, and was elevated to the summit of happiness. He now began to reflect on what the angel Jefrad had said to him. He even remembered the grain of sand that became a diamond. The queen and he adored the Divine Providence. Zadig permitted Missof, the fair coquet, to make her conquests where she could. He sent for the freebater Arbogad, and gave him an honourable commission in his army, with a promise of promotion to the highest dignity. He assured him, however, if did not conduct himself like a soldier of honour, and discontinue his profession of robbing, he would make a public example of him.

Setoc, with his bride Almona, were sent for from Arabia, to preside over the commercial affairs of Babylon.

"ZADIG; or, the BOOK OF FATE," is the production of VOLTAIRE. The Episode of the Angel Jefrad, however, is evidently borrowed from PARNELL's "Hermit," which we give below to show the resemblance. The Story is originally oriental, according to DR. GOLDSMITH; and is found in "More's Dialogues," and "Howell's Letters." It is a beautiful illustration of the Universal Truth, that "God is the Author of Evil as well as of Good."

THE HERMIT. BY DR. PARNELL.

FAR in a wild, unknown to public view,
From youth to age a rev'rend Hermit grew;
The moss his bed, the cave his humble cell,
His food the fruits, his drink the crystal well;
Remote from man, with God he passed his days,
Pray'r all his business, all his pleasure raises.

A life so sacred, such serene repose,
Seem'd heav'n itself till one suggestion rose—
That vice should triumph, virtue vice obey;
This sprung some doubt of Providence's sway:
His hopes no more a certain prospect boast,
And all the tenour of his soul is lost.
So, when a smooth expanse receives impress
Calm Nature's image on its wat'ry breast,
Down bend the banks, the trees depending grow
And skies beneath with answering colours glow;
But, if a stone the gentle sea divide,
Swift ruffling circles curl on ev'ry side,
And glimm'ring fragments of a broken sun,
Banks, trees, and skies, in thick disorder run.

To clear this doubt, to know the world by sight,
To find if books, or swains, report it right,
(For yet by swains alone the world he knew,
Whose feet came wand'ring o'er the nightly dew)
He quita his cell; the pilgrim staff he bore,
And fix'd the scollop in his hat before!
Then, with the rising sun, a journey went,
Sedate to think, and watching each event.

The morn was wasted in the pathless grass,
And long and lonesome was the wild to pass;
But, when the southern sun had warm'd the day,
A youth came posting o'er a crossing way;
His raiment decent, his complexion fair,
And soft in graceful ringlets wav'd his hair:

Then, near approaching, "Father, hail!" he cried,
And, "Hail, my son!" the rev'rend sire replied:
Words follow'd words, from question answer flow'd,
And talk of various kind deceived the road;
Till each with other pleas'd, and loath to part,
While in their age they differ, join in heart.
Thus stands an aged elm in ivy bound,
Thus youthful ivy clasps an elm around.

Now sunk the sun; the closing hour of day
Came onward, mantled o'er with sober gray;
Nature in silence bid the world repose;
When, near the road, a stately palace rose.
There, by the moon, through ranks of trees they pass,
Whose verdure crown'd their sloping sides with grass.

Cador was advanced to one of the highest offices in the state, as the reward of his distinguished service: indeed he was strictly the friend of the king: and Zadig was the only monarch in the universe that could boast of such an attendant.

The dwarf, though dumb, was not wholly for-otten.

The fisherman was put in possession of a very handsome house; and Orcan was sentenced not only to pay him a very considerable sum, for the injustice done him in detaining his wife, but to resign her likewise to the proper owner. The fisherman, however, softened the rigour of the sentence, and took the money only.

He left not so much as Semira wholly disconsolate, though she had such an aversion to a blind eye; nor Azora comfortless, notwithstanding her affectionate intention of shortening his nose; for he soothed their sorrows by munificent presents. The envious man, indeed, died with shame and vexation. The empire was glorious abroad, and in the full enjoyment of peace and plenty at home. This, in short, was the true golden age. The whole country was governed by love and justice. The people blest Zadig, and Zadig blest Heaven.

It chanc'd the noble master of the dome
Still made his house the wand'ring stranger's home;
Yet still the kindness, from a thirst of praise,
Prov'd the vain flourish of expensive ease.
The pair arrive: the livery'd servants wait;
Their lord receives them at the pompous gate;
The table groans with costly piles of food,
And all is more than hospitably good.

Then led to rest, the day's long toil they drown,
Deep sunk in sleep, and silk, and heaps of down.
At length 'tis morn, and, at the dawn of day,
Along the wide canals the zephyrs play;
Fresh o'er the gay parterres the breezes creep,
And shake the neighbouring wood to banish sleep.
Up rise the guests, obedient to the call;
An early banquet deck'd the splendid hall;
Rich luscious wine a golden goblet grac'd,
Which the kind master forc'd the guest to taste.
Then, pleas'd and thankful from the porch they go,
And, but the landlord, none had cause of woe:—
His cup was vanish'd; for in secret guise,
The younger guest purloin'd the glitt'ring prize.

As one who spies a serpent in his way,
Glist'ning and basking in the summer ray,
Disorder'd stops to shun the danger near,
Then walks with faintness on, and looks with fear;
So seem'd the Sire, when far upon the road,
The shining spoil his wily partner show'd:
He stopp'd with silence, walk'd with trembling heart,
And much he wish'd, but durst not ask to part:
Murm'ring he lifts his eyes and thinks it hard
That gen'rous actions meet a base reward.

While thus they pass, the sun his glory shrouds,
The changing skies hang out their sable clouds;
A sound in air presag'd approaching rain,
And beasts to covert scud across the plain.
Warn'd by the signs, the wand'ring pair retreat
To seek for shelter at a neighb'ring seat.
'Twas built with turrets on a rising ground,
And strong, and large, and unimprov'd around;
Its owner's temper, timorous and severe,
Unkind and gripping, caus'd a desert there.
As near the miser's heavy door they drew,
Fierce rising gusts with sudden fury blew;
The nimble lightning, mix'd with show'rs, began;
And o'er their heads loud rolling thunders ran.
Here long they knock, but knock or call in vain,
Driv'n by the wind, and batter'd by the rain.

At length some pity warm'd the master's breast
(Twas then his threshold first receiv'd a guest);
Slow creaking turns the door with jealous care,
And half he welcomes in the shiv'ring pair;
One frugal faggot lights the naked walls,
And Nature's fervour thro' their limbs recalls:
Bread of the coarsest sort, with meagre wine,
(Each hardly granted) serv'd them both to dine;
And when the tempest first appear'd to cease,
A ready warning bid them part in peace.

With still remark the pond'ring Hermit view'd,
In one so rich, a life so poor and rude;
And why should such (within himself he cried)
Lock the lost wealth a thousand want beside?
But what new marks of wonder soon take place
In every settling feature of his face,
When, from his vest, the young companion bore
That cup, the gen'rous landlord own'd before,
And paid profusely with the precious bowl,
The stinted kindness of this churlish soul!

But now the clouds in airy tumult fly;
The sun emerging opes an azure sky;
A fresher green the smelling leaves display,
And, glitt'ring as they tremble, cheer the day:
The weather courts them from their poor retreat,
And the glad master bolts the weary gate.

While hence they walk, the pilgrim's bosom wrought
With all the travail of uncertain thought:
His partner's acts without their cause appear;
'Twas there a vice, and seem'd a madness here:
Detesting that, and pitying this, he goes,
Lost and confounded with the various shows.

Now night's dim shades again involve the sky; }
Again the wand'ers want a place to lie;
Again they search, and find a lodging nigh. }
The soil improv'd around, the mansion neat,
And neither poorly low, nor idly great;
It seem'd to speak its master's turn of mind,
Content, and not for praise, but virtue, kind.

Hither the walkers turn their weary feet,
Then bless the mansion, and the master greet.
Their greeting fair, bestow'd with modest guise,
The courteous master hears, and thus replies:

"Without a vain, without a grudging heart,
"To him who gives us all, I yield a part;
"From him you come, for him accept it here,
"A frank and sober, more than costly cheer!"
He spoke, and bid the welcome table spread,
Then talk'd of virtue till the time of bed;
When the grave household round his hall repair,
Warn'd by a bell, and close the hours with pray'r.

At length the world, renew'd by calm repose,
Was strong for toil, the dappled morn arose;
Before the pilgrims part, the younger crept
Near a clos'd cradle where an infant slept,
And with'd his neck: the landlord's little pride,
O strange return! grew black, and gasp'd, and dy'd!
Horror of horrors! what! his only son!
How look'd our Hermit when the fact was done?
Not Hell, tho' hell's black jaws in sunder part,
And breathe blue fire, could more assault his heart.

Confus'd, and struck with silence at the deed,
He flies, but trembling, fails to fly with speed.
His steps the youth pursues, the country lay
Perplex'd with roads, a servants show'd the way;
A river cross'd the path; the passage o'er
Was nice to find; the servant trod before;
Long arms of oaks an open bridge supply'd,
And deep the waves beneath them bending glide.
The youth who seem'd to watch a time to sin,
Approach'd the careless guide, and thrust him in;
Plunging he falls, and rising lifts his head,
Then, dashing, turns and sinks among the dead.

While sparkling rage inflames the father's eyes,
He bursts the bands of fear, and madly cries:
"Detested wretch!"—but scarce his speck began,
When the strange partner seem'd no longer man!

His youthful face grew more serenely sweet;
His robe turn'd white, and flow'd upon his feet;
Fair rounds of radiant points invest his hair;
Celestial odours breathe thro' purpled air;
And wings, whose colours glittered on the day,
Wide at his back their gradual plumes display.
The form ethereal bursts upon his sight,
And moves in all the majesty of light.

Tho' loud at first the pilgrim's passion grew,
Sudden he gaz'd, and wist not what to do;
Surprise, in secret chains, his words suspends,
And in a calm his settling temper ends.
But silence here my beauteous angel broke
(The voice of Music ravish'd as he spoke):

"Thy pray'r, thy praise, thy life to vice unknown,

"In sweet memorial rise before the throne:

"These charms success in our bright region find,

"And force an angel down to calm thy mind;

"For this commission'd, I forsook the sky:

"Nay, cease to kneel—thy fellow servant I.

"Then know the truth of government divine,

"And let these scruples be no longer thine.

"The Maker justly claims that world he made,

"In this the right of Providence is laid;

"Its sacred majesty thro' all depends

"On using second means to work his ends:

"'Tis thus, withdrawn in state from human eye,

"The pow'r exerts his attributes on high,

"Your action uses, nor controls your will,

"And bids the doubting sons of men be still.

"What strange events can strike with more surprise,

"Than those which lately struck thy wond'ring eyes?

"Yet, taught by these, confess the Almighty just,

"And, where you can't unriddle, learn to trust.

"The great vain man, who far'd on costly food,

"Whose life was too luxurious to be good;

"Who made his iv'ry stands with gobblets shine,

"And forc'd his guests to morning draughts of wine;

"Has, with the cup, the graceless custom lost,

"And still he welcomes, but with less of cost.

The mean suspicious wretch, whose bolted door,

Ne'er moved in pity to the wand'ring poor;

With him I left the cup to teach his mind

That Heav'n can bless, if mortals will be kind.

Conscious of wanting worth, he views the bowl,

And feels compassion touch his grateful soul.

Thus artists melt the sullen oar of lead,

With heaping coals of fire upon its head;

In the kind warmth the metal learns to glow,

And loose from dross the silver runs below.

Long had our pious friend in virtue trod,

But now the child half-wean'd his soul from God;

(Child of his age) for him he liv'd in pain,

And measur'd back his steps to earth again.

To what excesses had his dotage run!

But God, to save the father, took the son.

To all but thee, in fits he seem'd to go,

(And 'twas my ministry to deal the blow.)

The poor fond parent, humbled in the dust,

Now owns in tears the punishment was just.

But how had all his fortunes felt a wreck,

Had the false servant sped in safety back?

This very night (by secret plot contriv'd)

Of life and wealth his master he'd depriv'd;

Had he in this conspiracy prevail'd,

What funds of charity would then have fail'd!

Thus Heav'n instructs thy mind: this trial o'er,
Depart in peace, resign, and sin no more.

On sounding pinions here the youth withdrew,

The sage stood wond'ring as the seraph flew.

Thus look'd Elisha, when to mount on high,

His master took the chariot of the sky:

The fiery pomp ascending, left the view;

The prophet gaz'd, and wish'd to follow too.

The bending Hermit here a pray'r begun:

'Lord! as in Heav'n, on Earth thy will be done,

Then gladly turning, sought his ancient place,

And spent a life of piety and grace.

THE
S H E P H E R D,

CONDUCTED ON

The Principles of Universal Analogy.

VOL. III.

BY THE REV. J. E. SMITH, M.A.

LONDON :

PRINTED, PUBLISHED, AND SOLD BY B. D. COUSINS, 18, DUKE STREET,
LINCOLN'S-INN-FIELDS.

THE HISTORY OF THE

PROGRESS OF THE

ART OF PRINTING

BY

JOHN WATSON, ESQ. OF THE MIDDLE TEMPLE

AND

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Pantheism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 1, Vol. III.]

SATURDAY, JULY 1, 1837.

[PRICE 1½d.

THE SHEPHERD.

ONCE more we run before the wind, spreading our sails for another adventure on the rolling seas of public opinion. But we shall not congratulate either ourselves or others upon our resuscitation. It is merely a fact, and the matter-of-fact gentlemen may make a note of it in their memorandum books.

We call this Volume 3rd, on account of the huge gulf of time that lies between its commencement and our last number. The eight numbers which constitute Vol. 2, will stand as a memorial of the difficulties we have surmounted, in once more pursuing our destiny. They are the eight persons which were saved in the ark, when the flood came and inundated the earth. They constitute also a sort of Apocrypha to the Old and New Testaments of the *Shepherd*, which Apocrypha being the representative of the second person in the trinity, has been crucified by the Protestant Church for the salvation of the souls of the people, and received by the Holy Mother Church for the same purpose. There will, no doubt, be a similar difference of opinion upon our transition series. Some will bind it up with the first volume. Others, not knowing what to do with it, will deny its authenticity, and exclude it from the canon.

We beg leave to state, in the introduction of this new series, that we do not consider ourselves as rivals to those who are attempting to re-constitute society upon more equitable principles. We are perfectly willing to co-operate with any party that aims at such a happy result, for we have laid down no political form of society in the *Shepherd*, which can prevent us from lending our aid to any other form which is an improvement upon the present. Our doctrine is more a revelation of what is taught us by our Universal Mother Nature, than a scheme or plan of our own. No plan will stand but the ultimate, which is guarded and supported by all the laws of our physical, moral, and intellectual nature; but mankind may be obliged to make many unsuccessful attempts before they arrive at this ultimate, if indeed it can be attained. Acting upon these principles, we are not political bigots, and cannot quarrel with other men upon financial, commercial, or jurisprudential speculations: for if they be determined to quarrel with us, we follow the advice of the snail species, by drawing in our horns, or mayhap, like the pen-bug, we roll ourselves up, and wait till the blusterer has expended his wrath; but against all conservatives we make a determined push, because we want to move on.

Be it understood, however, that our doctrine has a political end. It is the foundation of a new universal political system. But we are not political tinkers; we take no delight in soldering an old pan; and perceiving that this old-pan-soldering system is the rage of the day, and that, with the exception of Mr. Owen, no political agitator reverts at all to first principles, but builds his expectations upon means alone, without a preparation of mind to use the means to advantage, we have adopted a course of our own, and resolved to point out *some* first principles of thought and action, without the universal adoption of which, no means, whether they be ballot, universal suffrage, or any other boon, will be of any value to the people. It must always be remembered, that the power which employs means is *mind*, an invisible, spiritual principle, and if that power is not qualified by right principles to use the means judiciously, the

means will prove a curse instead of a blessing. The foundation, therefore, of politics is a spiritual foundation—it is the building only which is material.

Our principal objection to Mr. Owen is, that he has materialized society, or rather, that he *would*, if he could, materialize it. Mr. Owen has a moral end in view, and a very good and benevolent end. He has also based his system upon an abstract principle, viz. the principle of moral necessity in the formation of character. But this is not an ultimate principle, neither is it a living principle, nor an intelligent principle, nor an intelligible principle; it is a most profound and horrific mystery, and it is made more mystical, more horrific, than *necessity* requires, by being wrapt up in a winding sheet, and painted without eyes, without ears, and void of all the elements of life, except *motion*; a walking spectre—the great power of Nature, which confers all life and consciousness, and yet seems to have none. Perhaps this is not positively asserted, but it is silently implied; and implied, too, upon the curious plea, that we know nothing of God! Do we know any thing of Necessity? Is death preferable to life, or can a philosophy be based on a principle of Universal Death, as the *prime mover*? Then, again, we are told we are the creatures of "CIRCUMSTANCES." Here is a whole population of these dead, eyeless, earless, brainless, *moving* spectres. Circumstances! a kind of heathen gods, no doubt—a system of polytheism, which would degenerate into a sort of Egyptian idolatry in the course of a century. Creatures of circumstances! Any thing but life in the Creator! What extreme caution is employed to exclude the principle of Universal Vitality from the system! Sometimes it is *necessity*, sometimes *circumstances*, or a *combination* of circumstances—but never, never, never is the principle of universal life adopted as a basis. Upon this latter principle we take our stand.

It is for want of this *principle of universal life* that Owenism cannot live. It reminds us, at present, of the story of the creation of Adam. It appears that the body was formed first, but it was of no use alone. It could not move. It lay like a torpid snake where it was made, until "God breathed into its nostrils the breath of life, and man became a living soul." In these few words are comprised an epitome of the whole history of Owenism, if ever it succeed. It is also said of darkness, that it existed first; but of what use was it till light, the principle of life, asserted its supremacy as the *moving principle*? The Owenites may laugh at these analogies; we use them not as authorities, but as illustrations.

Owenism is susceptible of this principle of life. It is not positively, but rather negatively atheistical. We believe, indeed, that Mr. Owen himself would be very happy to see the living principle called into vivid action within his original and infinite abyss of Necessity, and her innumerable offspring of Circumstances. But the particular training of his mind, and his *experiences*, to use a Methodist phrase, have not qualified his mind for that mission, and though he may perceive the policy, he does not perceive the natural necessity of the graft of faith. He does not even see the difference between universal and sectarian faith. We judge from his lectures. He is in the transition state of infidelity, which is the principle of destruction in respect to old faiths, but not a principle of union, or gathering.

Owen has many friends, who abjure infidelity as a 'principle of action. Mr. Finch, one of his ablest and most devoted adherents, has frequently attempted to engraft the Social System upon the stock of Christianity. We have read with pleasure his late letters in the *New Moral World* upon the subject, and we have read the editorial remark, which says that the Editor "does not know to what conclusions Mr. Finch may come, but it is evident, from what he has already said, that Christianity is of no use whatever." This is what Mr. Finch himself partly acknowledges, but he desires to make it of use as an element of human society, to which it belongs, and of which it constitutes the very spinal marrow, running down the back-bone of time from the beginning to the end. But let Mr. Finch proceed. There is no fear of success—it is only a question of time. The demonstrations of science and of sober reason, combined with the evidences of human testimony, are not to be put down by a superficial philosophy, which the learned have now almost entirely abandoned, and left, like their old clothes, to be worn as usual by those who either cannot or will not wear better. We must now have breadth of colouring, a wide expansion, a universality, of vision, a universal principle of life, and a plan of Providence; and instead of making schemes and plans of our own, *our whole business must be to discover the plan of Providence respecting Human Society from the analogies of history and of general science.*

This is the object of the *Shepherd*. The Editor, therefore, speaks not of himself, and does not wish to be personified in the discussion of such high matters. He is not the Shepherd: he is merely the Editor. The *Shepherd* is the *Principle of Universal Life*. In his name we write. His work we do—his commission we hold. We write when he commands, and cease when he puts his interdict upon us. We are passive, and wish to be so. But the work of human progression can never stop, and we are always glad when we have a post assigned us for urging it on.

We are materialists, in so far as we work with materials; but we do not consider lumps of dirt as first principles. The strongest elements of Nature are those which *seem to be nothing at all*. *Vanity* itself, which is the very type of nothingness, is one of the most puissant principles that we know of. What can be more substantial than a stone, or a greater reality than a brick? yet they are poor, helpless things, when an idea or a passion takes hold of them. Your somethings are mere nothings, but your nothings are powerful realities—autocrats, whose authority there is no gainsaying. These *nothings* we deal with, and verily, we will kick your somethings about, like so many rotten turnips and frost-bitten potatoes, if you do not acknowledge that the nothings are somethings, and the somethings mere nothings.

In this volume of the *Shepherd*, we mean to give an abstract of all the principal Social Systems that have been proposed to the world—such as those of Plato, More, Campanella, St. Simon, Fourier, and Owen. The reader will then have it in his power, within the boards of one book, to form a very accurate estimate of the value of each, and, perhaps, to fill up the "*vacua*" of one, by the tuberosities of another. But we shall, in an especial manner, come into contact, sometimes collision, with Owenism; and the principle upon which we shall be guided in treating of this system is—the most fervent respect for Mr. Owen, as a man—respect, also, for his system, as a beau-ideal of social mechanical morality—but in respect to Imagination, and all its charming offspring, we must treat the system as a vacuum which Nature abhors, and which must be filled up. Imagination is too strong to be put down. It is the strongest power in Nature. It is the very essence of living being. If it is not a reality, as some people choose to express themselves, it is at least the father, the creator of realities, and therefore above, beyond, greater than, a reality. All progress is moved by it—all being is elevated by it—rudeness is polished by it—it beautifies deformity, and makes beauty more enchanting—it illuminates darkness, and makes light itself more visible—it alleviates pain, and enhances pleasure—and, whenever it is actively engaged, either in productive industry, or in the cultivation of the fine arts, or in the working out of the inspirations of a univer-

sal faith, it is sure to be productive of pleasurable sensations both to ourselves and others. In these three departments we claim for it free scope, and that free scope it cannot have in any system of doctrine now taught in the world. The poets are the only priests who offer a free and a willing sacrifice to the God; but their native inspiration is too often exasperated by the blow-pipe of a fretful sectarianism, or extinguished by the fire-damp of lurid infidelity. The Mab of Shelley is the high-priestess of Nature, and the Satan of Hæraud is the personification of moral and intellectual liberty. They are far above the spirit of the age to which they are addressed; but it would be a pity to bring down such imaginative minds to the level of the vulgar, if by any possibility the vulgar mind could be elevated to their's, or impregnated by their thoughts.

We had just finished the preceding paragraph on the 19th of June, when the news (it was a false report, but only a few hours too early) from the city reached us, of the death of the late King, and the commencement of a female reign. It is with no small pleasure we reflect that the third volume of the *Shepherd* appears under the shadow of a woman's wing. We have always regarded woman as the representative of the moral department of Nature; as the end of progress, which finishes in the emancipation of her sex, and in the full development of her peculiar excellencies. These being cultivated by the male, and reflected upon him, at the same time elevate his character by his participation of the feminine virtues, which must ultimately put a check upon the horrid brawls of intellect, and the savage contentions of physical outrage, and international warfare. This typical character of woman is not a conceit, it is a principle of Nature. It was in following out this principle rather too eagerly ("he that believeth shall not make haste,") that the St. Simonians, under *Enfantin*, one of the most splendid doctrinists of the age, amused the French, and confounded themselves, by looking out for what they called the Free woman, the representative of the *aspect materiel* of industry and production. They longed to find such a woman; the very existence of their doctrine and system depended on such a woman. They could not find her—a sad confutation of the prejudgment of those who assert that impostors are easily found, when a people is prepared to receive them. Here was a people, here was a vacant seat set apart for the purpose. But neither France nor England could furnish an occupant. To England they all looked for such a character. Their doctrine taught them that England must produce her. Nay, even the friends of Mr. Owen in Paris, who are now eager for his appearance in the French capital, and whom he has sadly disappointed by his indifference to their earnest invitation, look also to England for the personification of the female principle in a woman. Their mode of reasoning is different from that of the St. Simonians but the two facts are the same. Now, all England, the very government of England, is womanized. We are not augurs, neither do we regard omens, especially those on a small scale, when we are treating of great matters, but we like to trace analogies upon a large scale, when we are treating of large subjects, and now we say to both St. Simonians and Owenians, now is your time, seek out this woman, for the spirit of woman has now ascended the throne of England.

Is there a woman in England who can represent her sex? If there be, let her come forth, for be assured that until she appear, there is no salvation even for man. It is needless to reproach man for not doing woman's work. He cannot. He is not a woman; woman has a work of her own to do. She has her own feelings, she only can express them; she has her own wrongs, she only can describe them. Man is waiting for woman, and actually fighting with man, because woman does not intervene to terminate the quarrel.

We have many clever women amongst us—but what are they? Gossips, who can prate well, syrens, who can sing well, and blue stockings, who can write well on everything but salvation—women, who write for personal fame, for money, or merely to give vent to their own vagaries. But there is scarcely a woman amongst them who writes for any great social purpose, in whom the selfish principle is absorbed in the social, and who seems willing to make a sacrifice of her fair fame for a time, that she may ameliorate the condition of her sex and species.

They are either not conscious of their degradation, or they want the moral courage to assert their rights. Talent is not wanting. It is the faith in the moral progression, and final destiny of the species that they lack.

THE STATE OF RELIGION.

It is no easy matter to determine the state of religion in a country, especially in a Protestant country, where such a variety of sects and opinions are to be found. If we give credit to the magazine reports of the Home Missionaries, and Church Extensionists, there must be a considerable increase yearly added to the ranks of the faithful, and a great revival of faith in the land. On the contrary, if we credit the statements of Socialists and Infidels, and political agitators, there is a large slaughter of church-game committed every year by these theological and metaphysical sportsmen, which is gradually weakening the strength of the church, by thinning its ranks, and drying up its sources of nourishment. The statistics of religion cannot be depended upon. The reports are generally drawn up by interested parties, and small Disenters use no small craft in making themselves appear larger than Providence has ordained them. Thus chapels and congregations have been inserted in official reports which had ceased to exist as such, before the reports were printed.

But the number of churches and of attendants is a trifle, compared to the vital question of the state of religion. The motives to church-going, in more than one half of the population, are very suspicious, and certainly by no means religious. Not long ago we heard a gentleman confess, that he had a family who had no religion at all, but were regular church-goers. When they return, they mimic the preacher, imitate his tones, criticise his discourse, ridicule his looks and his attitudes, and pour out torrents of abuse upon the music. But still, he said, they go to church, chiefly because other people go—they go to see, and to be seen; to spend the time, and perhaps to avoid the reproach of avowed Deism, or something worse. This class of people is very numerous. They would worship the Devil, if it were fashionable. They are mostly ladies; and two-thirds at the least, perhaps three-fourths of the church-goers of London, are females. It is not uncommon to see several adjoining seats filled with women, without a single male convoy.

We have made the same observation in Exeter Hall, at the religious meetings in May. They are certainly splendid assemblages at times. Compared to a Radical public meeting at the Crown and Anchor, where there are no forms to sit upon, and where the people crowd around the platform, and stow one another, with their hats on their heads, and their hands cautiously keeping guard in their pockets, the difference, in point of comfort, order, and respectability, must make a deep impression on those who have witnessed both. The room is, we believe, the largest in the kingdom. It is frequently crowded in the holy month of May, and then we have observed that ladies' bonnets seem to floor the wide expanse of space before the chair, leaving only a few dark openings, in which appear the uncovered heads and sable-coloured shoulders of an obliging male, who has condescended to escort a bouquet of females. The Hall presented such a sight as this when O'Sullivan and Macgee made their last appeal at the Great Protestant Meeting in May. This was an exciting occasion. Some of the May meetings are but thinly attended.

The best criterion for determining the power of religion is the funds, which are raised upon the voluntary principle. These are certainly in a prosperous and growing condition. The Bible Society raised upwards of £108,000 last year, and the London Missionary £64,000. When we consider the vast number of spiritual taxes that are levied upon the people by the Religious Parliaments of Exeter Hall, one is astonished to find that a single society can call in its hundreds of pounds from a single congregation. The following are a few of the last contributions to the Missionary Society from some of the London chapels. We do not pick them, but read right on, omitting only the odd shillings and pence:—

| | |
|------------------------------|---------|
| Orange Street..... | £116 |
| Paddington..... | 20 |
| Peckham..... | 172 |
| Pimlico..... | 68 |
| Poultry Chapel..... | 200 |
| Queen Street, Radcliffe..... | 25 |
| Sion Chapel..... | 22 |
| Silver Street..... | 80 |
| Spa Fields..... | 39 |
| Stepney..... | 182 |
| Stockwell..... | 140 |
| Stoke Newington..... | 55 |
| Surrey Chapel (Ladies)..... | 111 |
| Tabernacle..... | 215 |
| New Tabernacle..... | 154 &c. |

This is a pretty fair specimen of London and its vicinity, beginning about the middle at the letter O; and these are only the contributions for one single society. We know nothing in the political world to parallel this, except the "rint," and there is a religious principle at the bottom of it, for O'Connell takes care to season all his speeches with the extreme unction of the church—"Without faith ye can do nothing." Are you sorry that it is so, reader? You may just as well be sorry that the earth moves round the sun, and that a day is only twenty-four hours long. Your business is to study the laws of Nature, not to legislate for Nature. It is an eternal law of Nature, that faith shall rule the world, and if men cannot get a good faith, they will take up with a bad one.

But what is all their zeal doing, and where are its fruits to be seen? Reader, if thou imaginest that Nature ever does any thing in vain upon so large a scale as this, or even upon an insignificant scale, thou hast some philosophy to learn yet. Perhaps thou dost not contribute to these societies; perhaps thou dost not read their reports, and knowest nothing of their proceedings; and for this reason thou, perhaps, imaginest that they are of no use. It is thus that the religious world also judge of the movements of the irreligious. There are few men as universalized in their views of Nature, as to admit that their opponents are of any use to society. We have no such prejudices. We think the Bible, Missionary, and Tract Societies eminently useful, especially the latter, in foreign countries. The little tracts do wonders abroad, in breaking in upon the strongholds of Pagan idolatry. The missionaries are opening up channels of communication between all the scattered tribes of humanity; and the Bible Society is collating their different languages, and presenting to each, in his own tongue, the only respectable history of the human race which is to be found in the world. Whether it be literally correct or not, is nothing to the purpose at present. It is of great importance that mankind should have common ideas upon such a subject. But the discoveries of science, especially of Egyptian archaeology, are bearing so powerfully at present upon the Old Testament history, and producing such marvellous confirmations of its general accuracy, that for some years past, especially since the discoveries of Young, Champollion, Rosellini, Letronne, and others, opposition has been entirely hushed, and the question of the authenticity of the historical records of the Bible set almost at rest. The principal, if not the only field of battle at present is the account of the creation, and that is not history, but revelation. The distinction is of great importance. Geology will force it upon the world. The coincidence between old Moses and new science is very remarkable, considering the antiquity of the former. Moses begins at the bottom of the scale, at darkness and chaos; thence he rises by gradation to the highest order of being. Science confirms this. The chief point on which the two quarrel at present is the word "day." It is lucky that there is a difference. It is fortunate, also, for the same reason, that there are chronological errors and historical contradictions in the Bible; for if the letter were faultless, the spirit might be overlooked, and conservatism might succeed in preserving old relics of superstitious rites and ceremonies for ever. *The spirit of progress lies in the blunders and the mysteries.* These are the whip and the spur which goad on the stationaries.

Of this book the Bible Society of London has dispersed

between ten and eleven millions since its first institution. The greater proportion of these are sold. Of tracts relating to this book, the Tract Society has distributed upwards of sixteen millions within the last year; and the three Missionary Societies, viz., the London, Wesleyan, and Baptist, have levied an income of £151,038 during the same period, for the support of missionaries and missionary stations in all parts of the world, to propagate the contents of this book. The total voluntary income of the five societies, for the last twelve months, was £270,000, and rapidly increasing. This amount is doubled by the sales.

If we are asked our opinion of the fruits of these societies, we reply, that any thing which tends to approximate the inhabitants of heathen countries to those of civilized and Christian nations, is a universal good; for unanimity is always a blessing, independent of truth or error. This approximation may take place, either by infidelizing the heathen, in respect to their own religion, as has already been done to a considerable extent in India, or by Christianizing them, as has been done to a very small extent. In either case a considerable barrier of superstition has been removed, and to all appearance there is at this present moment over the whole world, a universal spirit of disaffection arising, which is playing fearful havoc with olden systems. The rising generations are refusing to do those dirty jobs in which their fathers have gloried, and our Christian missionaries are encouraging them in rebellion. An Indian missionary (Mr. Crisp) at the last May meeting, speaking of the supineness, and even opposition of the natives to their established religion, says,

"But one of the most painful circumstances connected with this system is the great car feasts. By whom is the car prepared? Is it by the spontaneous contributions of the natives? Is the power vested entirely in their hands, of making all the arrangements which are intended to give an imposing effect to idolatry? No; when a feast is anticipated, a public document is sent to the "Presence," as it is called, that is, to the chief magistrate, stating that on such a day, and at such an hour, a particular feast is to be celebrated, and requesting that the money necessary may be granted; that bamboos, and coconut trees, and other things required for the car, may by compulsion be supplied: and these are brought in by compulsion from the surrounding districts. When so brought in, the person engaged in preparing the car for the feast, is the local representative of the British Government, and *he it is who directs the workmen what to do*. The whole concern is regarded by the natives, and in good faith it really is, a Government work. When the car has been thus prepared, by whom, up to the present time, have the poor creatures been brought together to draw it? You may imagine, and many do suppose, that such is the zeal of the Hindoos for their idolatry, that when they come together to their great festivals, they are all anxious to draw this car; but it is no such thing. These cars have all been drawn by persons driven in by a *peon* armed with a whip. I testify to you what I have seen. I have seen them by hundreds pass the gate of my residence. And what for? that they might be compelled to draw the idol car. And after they have laid hold of the cables, who have been the persons to urge them onward? The Government *peons*, with long canes, which they apply to those that seem dilatory. It does, indeed, appear, from the memorial lately presented to the Governor of Madras, that in consequence of a lamentable disaster which occurred at the Conjevaram feast, the compulsory attendance of the natives is no longer to be insisted upon, and if this be adhered to, most certainly shall we rejoice. But the system, up to the present time, has been that just described to you."

Thus you see the same spirit of discontentment, which has shaken the ecclesiastical institutions of Europe, prevails also in India, originating also in the same cause—compulsory rating and personal oppression. Yet still the people of India are attached to their religion! So are the people of England! How is this to be explained? In the same manner as the emptiness of churches, and the fulness of religious Societies' funds, are to be reconciled. The popular mind, both in India and Europe, is powerfully propelled towards a reformation, not a destruction of the prevailing religion. Thus a writer in the *Asiatic Journal* discussing the question, whether Christianity or Deism, or re-

formed Hindooism, will be the future religion of Hindostan, decidedly fixes on the latter. And so say we; and we say, also, that reformed Islamism will be the future religion of Turkey, and reformed Christianity of Europe. But all these three are one. Every religion contains the elements of the everlasting religion of Nature, and, by progressing, as certainly arrives at final truth, as a river, by progressing, arrives at the sea. It matters not which way the river runs, to the sea it goes. Carry out any religion you please to its ultimate principles, and you find it vibrate in unison with Nature's universal and everlasting laws. No religion has ever yet been destroyed; the religion of the Greeks and Romans is all alive in Catholicism, and will live for ever in Pantheism.

Religion is progressing inwardly; and by pushing any religion inward to the heart and soul, away from outward forms and ceremonies, you arrive at the true religion of Paradise—Universal brotherhood, Universal faith, the religion of Nature and the God of Nature. But the theology of the most civilized and scientific people must necessarily take the lead in the work of progression.

THE TRANSCENDENTALIST'S DIALOGUES. No. I.

[*Note*.—The object of these dialogues is chiefly to lead to a negative or hypothetical result. They are designed chiefly to show the absurdities of the common-sense school, who fancy, by their own uncultivated arguments, that they are able to discourse on the most abstract subjects. I intend to exhibit the contradictions, to which their definitions, &c., inevitably lead, and occasionally to give hints of a higher philosophy.—T.]

A DIALOGUE ON "THE ONE."

SCENE.—*Transcendentalist sitting at a table with a newspaper.*

Trans.—And so it will appear again! The good old *Shepherd* will be published again; The best news contained in this paper.

Enter Materialist.

Oh, here you are, my good Materialist; here is a piece of news for you. The *Shepherd* is coming out again.

Mat.—Indeed; then, I assure you, I am very glad of it.

Trans.—How so! A Materialist rejoiced at the re-appearance of the *Shepherd*?

Mat.—Why to tell the truth, I have been reflecting on a conversation we had together last March, and I find that a man may be an Idealist, and not be so very absurd a creature after all. In short, I am not such an *of-course* Materialist as I used to be.

Trans.—Then, you will soon cease to be a Materialist altogether. Ah, I little thought when I sent that dialogue to the *Shepherd* that it would be the last paper that would appear there.

Mat.—Now I'll tell you a plan. You know we still differ on certain points; suppose we meet, and discuss now and then, on some philosophical subject, and occasionally send our dialogues to the *Shepherd*.

Trans.—I have not the slightest objection, provided the Editor is kind enough to insert them; and as there is no time like the present, let us have a discussion now. Here is a slate hung up against the wall; on it I will write. (*T. writes*).

AXIOM.

Every word that is not sheer nonsense, has a signification.

Mat.—Come! That is profound! Well, I agree to that!

Trans.—My dear friend, if every one had been aware of that sentence, numberless religious discussions would have been saved. But now I will write a word. (*Writes "ONE."*) There, that is a word, and must have a signification as well as others.

Mat.—Of course! And a signification most easy to find. Here, for instance, is *one* piece of wood.

Trans.—Is that a single atom, or is it composed of a number of particles?

Mat.—Hem! It is six inches square. It is composed of a great number of particles.

Trans.—In other words, it is an aggregate of particles, and to this aggregate you give the name of *one*, just, as we say *one* army, *one* mob, though we know that there are *many* individuals in the army and the mob. Thus, it would seem, this piece of wood is at the same time *many* and *one*; many, with respect to the number of its particles, *one*, if we regard their combination.

Mat.—Exactly. Few would differ on this point.

Trans.—Now, can you fancy some explosion taking place, and their particles being separated and scattered?

Mat.—Certainly. This happens to a certain extent every time a violent explosion happens.

Trans.—Then the piece of wood, considered as a *one*, would be destroyed; but the component particles would not be destroyed.

Mat.—No. In other words, the union would cease, and the particles would exist in a separate state.

Trans.—The *many* would still continue, but the *one* would be annihilated. Now, supposing the piece of wood again to be one united whole, if we destroyed all the component particles, would the *one* piece exist?

Mat.—What, after every particle was destroyed? Of course not! What trifling questions you ask!

Trans.—Perhaps so. But let us see the result. The *many* is necessary to the existence of the *one*, but the *one* is not necessary to the existence of the *many*.

Mat.—Stay, stay; the multitude of particles could not exist, did not *one* single particle exist. The *many* is itself but a multitude of *ones*. Each of these *ones* has a separate existence of its own, and it is on the existence of these, that that of the *many* depends.

Trans.—So, then, it appears, that there are two significations to the word, "*one*." In the first sense, it means an union of a multitude, in the second signification, each of the particles which constitute the multitude, is in itself a *one*.

Mat.—Yes, and we might distinguish them by the words "*One* of composition," "*One* of ultimate division." And it appears to me that the "*One* of ultimate division" is the purer "*one*" of the two, for it is *one* without being *many*, while the "*one*" of composition is at the same time *many* and *one*.

Trans.—Good. Now we see the aggregate *one* every day; us, for instance, your piece of wood. This aggregate *one* may, as we well know, be resolved into a *many*. Now have we ever seen the *one*, which is the result of ultimate division, and which is so pure a *one* that it cannot be resolved into *many*?

Mat.—No, we never saw it; but it is plain that it does exist. Thus I have not instruments fine enough to reduce this wood to its ultimate particles, nor eyes acute enough to perceive them after the division, but still I am induced to infer their existence, nor do I think the infinite divisibility of space any argument against it.

Trans.—There I thoroughly agree with you. Although space be infinitely indivisible, and hence *theoretically* every particle is infinitely divisible, it does not follow that the particles are *actually* so. For we can readily conceive of a body occupying a certain quantity of space, and yet being self-existing.

Mat.—Of course; and we must come to that at last: for the existence of every body must depend on the existence of its parts—the existence of these parts on that of their smaller parts, till we come to ultimate particles, whose existence depends on nought but themselves, that is, are self-subsisting.

Trans.—I see; but you do not arrive at these ultimate particles by the evidence of your senses, but by a process of inference.

Mat.—Exactly, and by a very just process; for if the existence of one thing depends on that of another, and the existence of that other depends on that of a third, we must come at length to a thing self-subsisting, or our whole fabric will fall for want of a foundation.

Trans.—Very good; but the form, colour, &c. of this particle are unknown.

Mat.—Oh, certainly, it has never been perceived by our senses; it is too minute.

Trans.—True, but we are to consider that as no argument

against its existence, but rather a proof of the imperfection of our faculties, or scientific machines.

Mat.—That is precisely my view.

Trans.—Then let us call the ultimate particle of this piece of wood X, and let us try if, by a reasoning process, we can discover what qualities X possesses. In the first place, it is self-subsisting, and, with a number of other particles which are equally self-subsisting, composes this piece of wood. Does it occupy any portion of space?

Mat.—Oh, yes, certainly; for as the piece of wood occupies space, the particle which arises by division must occupy space also, though a very small portion.

Trans.—Then I'll write as follows:—X is a self-existing body, co-existing with other self-subsisting bodies, and occupying a portion of space.

Mat.—That seems right enough.

Trans.—As other bodies exist with it, it is very evident that it occupies only a portion of space, and not the whole abyss.

Mat.—Quite clear. It is self-evident that only a portion of space is occupied.

Trans.—If X only occupies a portion of space, it must be bounded in space, and that which is bounded in space has a form.

Mat.—Yes, yes; X has some form or other; what form in particular I do not know.

Trans.—And to constitute a form (*i. e.* the form of a body), it is necessary, not only that a body should exist, but also that it should be *enclosed*. Thus a plane figure (*e. g.* a triangle) is formed by one part of a surface bounding another.* And if form is necessary to a body, and a boundary is necessary to constitute a form, it follows that X is not self-existing, as the subsistence of the bodies which bound it are necessary to its own existence. And hence we find that our proposition respecting the ultimate particle leads to a contradiction.

Mat.—It appears so, indeed, and I will reflect further on this matter. But time grows late. I will bid you adieu for the present. Next time we meet, we will discourse further on "*the One*."

THE TRANSCENDENTALIST.

* *Shepherd*, vol. ii. page 52.

CURIOUS SPECIMEN OF INDIAN IMPOSTURE.

From Lieutenant Bacon's *Hindustan*. London: W. H. Allen and Co., 1837.

AMONG the lower orders it is no uncommon thing to find men who can counterfeit so skilfully the semblance of death as to deceive even a medical man, until the hand is applied either to the heart or pulse. These men are frequently at very great pains to acquire this faculty, and practise it for many purposes. It serves sometimes as a means of concealment, but more frequently it is made available for the purpose of imposition.

The imitator of death is laid upon a *charpâhi*, or light native bed, and being painted as if covered with wounds and bruises, he is carried in a state of complete nudity to the house of an European magistrate, or other civil functionary; here a pitiable story is related of his having been murdered in some remote village, and with bitter tears and lamentations the magistrate is entreated to send officers to make official investigation of the case, and if possible to bring the perpetrators to an expiation of the outrage. In the mean time, the friends of the unfortunate murdered man, having excited the compassionate interest of the Englishman, or some of the inmates of his house, solicit a gratuity for defraying the expenses of the funeral, for which they aver that they have no means; and if the trick be new to the beholders, an ample shower of donations will most likely be afforded to the poor bereaved creatures. The moment their object is secured, the sorrowing family withdraw, carrying with them the corpse of their deceased relative, who, as soon as he is out of sight of the house where the imposition has been practised, returns to the mortal world, and again condescends to make use of his limbs, taking care to appropriate an adequate share of the bounty which his ingenuity has purchased. Having then cleansed himself from the stains and artificial

wounds, the whole party disperse, to avoid apprehension when the fraud is detected.

I was once staying at the house of a civilian, when one of his servants came in and reported that a murdered man had been brought to the door by a party of his friends, in the manner related above. He intimated at the same time, that, from the appearance of the strangers, he was suspicious of their statement, and believed the dead man to be a counterfeit. We went out, and found a squalid-looking corpse, with two or three wounds upon the chest, and with many marks of violence about other parts of the person.

The bed upon which the body lay extended was placed upon the ground, and all around it squatted the relatives and friends who owned it, howling, screaming, and greening with a touching emphasis, which would have excited the sympathy of the most obdurate. My friend approached to examine the body, but was assailed with a thousand importunities not to pollute the corpse, before the rites of sepulture had been performed. He therefore refrained from touching the body with his hand, but remarking to the people that wood could not defile it, he stuck the sharp end of his billiard cue, which he had in his hand, into the side of the supposed corpse. This evidently disconcerted the surrounding throng, but as the body showed no signs of animation, or any fear of incurring a repetition of the test just inflicted, we began to think that the suspicion of the chupprassi had been unfounded. The blow was repeated with increased force, and until the sharp point of the cue penetrated the flesh between the ribs. A very slight quiver of the muscles, and an almost imperceptible movement of the head, discovered the cheat, and my friend then told the people that they had better take the body to the hospital, for that life was not yet extinct. "Wa, wa," said they, "why the man has been dead since cock-crow; how then can he be alive now?"—(An idiom quite as purely Hindostanee as it may be thought Irish.)

"Bring a tea kettle of boiling water," shouted the gentleman, to the dismay of the family.

"Sir, great Sir,—what would you do with boiling water? The man is dead."

"Exactly so, my good friends; and that is the reason that you are all weeping and sorrowful?"

"What else, Sir!"

"Why, I am a great physician, and know how to bring such dead men as these to life."

The poor fellows begged hard that the body might be spared; but the kettle was brought, and still the dead man moved not, until a small quantity was poured upon his feet, when he bounced from his *charpâhi*, and upsetting one half of his little brothers and cousins, fled like a spirit rather than an earthly body.

MARRIAGE IN THE HIMALA MOUNTAINS.

THE WIFE OF SEVEN HUSBANDS.

WHEN about a couple of miles from Missouri, I overtook a young Paharri damsel driving cows. My attention was caught by her graceful figure, and her highly picturesque costume. Her hair was gathered into a knot upon the crown of her head, and thence fell in the fashion of a horse's tail down her back; across her shoulders a bright red scarf was loosely thrown, and from her waist a short grey petticoat descended to her knees, below which a finely rounded leg and well turned ankle gave a finish to the figure, and formed by no means its least attraction. As I passed the girl, instead of screening her face from observation, as do the most modest females of the plains, she looked innocently in my face, exclaiming, "Do not drive my cows, I pray you, Sir, for they scramble off the road, and then I shall have much labour in collecting them again."

I was surprised at the freedom and simplicity of the damsel's address, and more so at her comely countenance and sparkling eye; the *Paharris* being characterized by the broad cheek bones and small twinkling eye of the Chinese.

"Well, then, my pretty lass," I replied, "you must let me amuse myself by talking to you as far as our journey may lie on the same road."

"Very well, Sir; but what can a *Feringhi Sahib* have to say to a poor girl of the mountains?"

"Why you see I am a stranger in these parts, and wish to pick up information respecting your beautiful country. Young and artless as you appear to be, you will be able to tell me much of which, though a traveller in many countries, I am yet in ignorance."

"Alas! Sir," replied she, "is it for the infant to instruct its parent? or for the young kid to direct the steps of the goat? I am but a child in knowledge, and do you bid me show you what our wise men call their own? Shall I tell you of my cows, or of the butterflies which sport over the flowers, or of the eagles sailing aloft yonder?"

"Yes, even there you could tell me much which I do not know. But have you no family or home to talk to me about? There I cannot enter, and can only learn by hearsay. Are you married?"

"Married! Certainly I am married, and have seven handsome husbands, the finest men in the village; but I cannot say they are such tall, straight fellows as the servants which follow you gentlemen from the plains."

"Seven husbands, did you say? What, all your own? or did I misunderstand you?"

"Ay! truly, seven husbands; what else should I say? We are not like the unfortunate women in the plains, who, it is said, have but one man, good or bad, belonging to them. But I am wrong to say seven; I have only six now; one of them I discharged yesterday. He was an idle, useless fellow, with only one eye, and a crooked back."

"What, do you send them away if they have any defects, or if you do not love them?"

"Certainly; or if a man should be idle or poor, a woman could not be expected to keep him, when she might have fifty better. Go your way, Sir; my cows go up this turning to the right."

"But tell me before you go, my pretty girl, if all the women in your villages are as fortunate as yourself in the number of their husbands, and if it be usual with them to turn their good men off with as little ceremony as you appear to have done?"

"Why," said the woman, "all my sisters are not considered so handsome as I am; but some have two husbands, some have three or four; few are so poor as to have only one."

"And would you have more than seven, if you could find them to please you?"

"No; if I have more than seven, it is impossible that they should be all good. Seven is a happy number."

"Then I suppose you will get another to supply the place of the seventh, whom you discharged yesterday."

"When I can find one whom I can love."

"But do not your husbands quarrel? Are they not given to jealousy one towards another?"

"No; why should they? Are they not treated according to their deserts?"

"Have you any children?"

The girl drew her red scarf over her face, and turning abruptly away, followed her cows.—*Lieut. Bacon's Hindostan.*

SELF-IMMOLATION OF GENIUS.

(From *D'Israeli's Literary Characters and History of Genius.*)

To this enthusiasm, and to this alone, can we attribute the self-immolation of men of genius. Mighty and laborious works have been pursued as a forlorn hope, at the certain destruction of the fortune of the individual. Vast labours attest the enthusiasm which accompanied their progress. Such men have sealed their works with their blood; they have silently born the pangs of disease; they have barred themselves from the pursuits of fortune; they have torn themselves away from all they loved in life, patiently suffering these self-denials to escape from those interruptions and impediments to their studies. Martyrs of literature and art, they behold in their solitude the halo of immortality over their studious heads, that fame which is "a life beyond life." Van Helmont, in his library and his laboratory, preferred their busy

solitude to the honours and invitations of Rodolphus II., there writing down what he daily experienced during thirty years. Nor would the enthusiast yield up to the Emperor one of those golden and visionary days. Milton would not desist from proceeding with one of his works, although warned by the physician of the certain loss of his sight: he declared he preferred his duty to his eyes; and, doubtless, his fame to his comfort. Anthony Wood, to preserve the lives of others, voluntarily resigned his own to cloistered studies. Nor did the literary passion desert him in his last moments, when, with his dying hands, the hermit of literature still grasped his beloved papers, and his last mortal thoughts dwelt on his *Athenæ Oxoniensia*. Moreri, the great founder of our biographical collections, conceived the design with such enthusiasm, and found such seduction in the labour, that he willingly withdrew from the popular celebrity he had acquired as a preacher, and the preferment which a minister of State, in whose house he resided, would have opened to his views. After the first edition of his *Historical Dictionary*, he had nothing so much at heart as its improvement. His unyielding application was converting labour into death; but, collecting his last renovated vigour, with his dying hands he gave the volume to the world, though he did not live to witness even its publication. All objects in life appeared mean to him, compared to that exalted delight of addressing to the literary men of his age the history of their brothers. Such are the men, as Bacon says of himself, who "are the servants of posterity,

Who scorn delights, and love laborious days,"

The same enthusiasm inspires the pupils of art, consumed by their own ardour. The young and classical sculptor who raised the statue of Charles II. in the centre of the Royal Exchange, was, in the midst of his work, advised by his medical friends to desist, for the energy of his labour, with the strong excitement of his feelings, already had made fatal inroads on his constitution; but he was willing, he said, to die at the foot of his statue. The statue was raised, and the young sculptor, with the shining eye and hectic flush of consumption, beheld it there, returned home, and shortly was no more. Drouais, a pupil of David, the French painter, was a youth of fortune, but the solitary pleasure of his youth was his devotion to Raphael. He was at his studies from four in the morning till night.—"Painting or nothing!" was the cry of this enthusiast of elegance. "First fame, then amusement," was another. His sensibility was as great as his enthusiasm, and he cut in pieces the picture for which David declared he would inevitably obtain the prize. "I have had my reward in your approbation, but next year I shall feel more certain of deserving it," was the reply of this young enthusiast. Afterwards he astonished Paris with his *Marius*. But, while engaged on a subject which he could never quit, the principle of life was drying up in his veins. Henry Houdley and Kirke White, were the early victims of the enthusiasm of study, and are mourned by the few who are organized like themselves.

"'Twas thine own genius gave the fatal blow,
And helped to plant the wound that laid thee low;
So the struck eagle, stretched upon the plain,
No more through rolling clouds to soar again,
Viewed his own feather on the fatal dart,
And winged the shaft that quivered in his heart.
Keen were the pangs, but keener far to feel
He nursed the pinion that impelled the steel;
While the same plumage that had warmed his nest
Drank the last life-drop of his bleeding breast."

AUSPICIOUS COMMENCEMENT OF THE NEW REIGN.

On the accession of a new Sovereign to the throne, we are naturally anxious to discover what are the leading motives which influence his mind, and what are the modes which he intends to follow in effecting his purposes. There is a certain moral influence exercised by kings over their subjects, independent of their executive authority. This moral influence it is more particularly our province to examine, as we are not

authorized by law to criticise legislative measures. The first proclamation of her present Majesty, was one of a peculiarly moral character—upon which we think we may safely venture a remark, without encroaching upon the forbidden fields of politics or ecclesiastics. Her Majesty, as becomes her sex, shows great anxiety for the moral and religious welfare of the nation. To effect this desirable end, she means to distinguish persons of piety and virtue by marks of her Royal favour. All very good, if she can discover the true from the feigned—the right sort from the wrong. The best and the wisest and the shrewdest are apt to be deceived in this respect; but our new virgin mother seems to have ideas upon this subject which are likely to excite a little controversy with even her virtuous and pious subjects.

"We do hereby require and command them (that is her subjects), and every of them, decently and reverently, to attend the worship of God on every Lord's day, on pain of our highest displeasure, and of being proceeded against with the utmost rigour that may be by law." If this is a mere matter of form, it is too bad to tantalize the Sabbatarians with hopes that are never to be realised, and promises never to be fulfilled. If it is sincere, and a plain declaration of motives and resolutions in the Royal mind, it means, that we are all to be compelled by law to go to church! "Well," as an old lady said to us, "it is all very good in a figure;" by which she meant, that we ought all to worship God in his temple (the heart). But the heart is not to be tricked into worship by proclamations, or whipped into adoration by magisterial authority. To make men religious *thus*, is to make them hypocrites. They would be better and more innocent, both to themselves and the Government, roaming at large over hill and dale, than stewed in a church or conventicle, with a posse of police, counting their heads, and calling over the roll, to see that none were absent.

The Queen, notwithstanding her excellent education, has evidently not learned the mode of making men and women religious; and the Bishops, her counsellors in pious affairs, are so screwed down by oaths, and articles, and creeds, and constitutions, and old forms, and private interests, that it is quite impossible for them to adopt any other means than those which have been employed from time immemorial, and which time immemorial has declared to be ineffectual. Threats of a similar nature are issued out against all blasphemy, cursing, swearing, profanation of the Lord's day, &c.; in fine, against numerous vices and immoralities which *really* are a curse to the nation at large. We think it most desirable that all these vices should be discountenanced. Cursing, swearing, drunkenness, gambling, are abominable crimes against the moral feelings of society; and the Sabbath is an institution of so superlative a character, that we do not think there is a sober and intelligent man in the country, who is not an advocate for its inviolability, unless society could be so organised as to make every day a Sabbath. Then the substance being come, the type might be dispensed with. But we cannot yet get the everlasting Sabbath; we must, therefore, be content with a sham Sabbath once a-week. It must be a sham Sabbath at best. But, like every other human or divine institution, it is susceptible of improvement. We wish, we heartily wish, that all labour could be abolished on the Sabbath. We wish that every servant were free on a Sabbath—that not even the Queen should have a right to extort obedience or service from her domestics on a Sabbath; that, in fact, it should be a universal jubilee throughout the nation, and that the voluntary principle should reign throughout the country without any other control than that of a well cultivated moral feeling. This is what we wish. But wishing is vain. It is a sort of beau-ideal of a Sabbath;—but in that beau-ideal is concealed the living truth—that until you get this well cultivated moral feeling, you cannot get your Sabbath. You begin at the wrong end—you put the cart before the horse—when you try to make the Sabbath first, for then you are obliged to use force to tinker up the leaking utensil. If rulers were to go the right way to work there would be no occasion for a proclamation to make a Sabbath. The people would make a Sabbath for themselves in spite of a proclamation to the contrary.

CURIOUS GEOLOGICAL CONTROVERSY.

(From Dr. Wiseman's Lectures on Science and Religion.)

EVERY one of my readers is doubtless aware, that in many parts of the world enormous bones have been found, which used to be considered those of the elephant—the *mammoth*, as it was called, from a Siberian word designating a fabulous subterranean animal. Besides these, and similar remains, vast accumulations of shells, and impressions of fishes in stones, as at Monte Bolca, have been at all times discovered in every country. All these used formerly to be referred to the deluge, and quoted as evidence that the waters had covered the entire globe, and extinguished terrestrial life, as well as deposited marine productions upon the dry land. But, perhaps, you will hardly believe me, when I say, that for many years the fiercest controversy was carried on in this country (Italy) upon the question whether these shells were real shells, and had once contained fish; or were only natural productions, formed by what was called the “plastic power of Nature” imitating real forms. Agricola, followed by the sagacious Andrea Mattioli, affirmed that a certain fat matter, set in fermentation by heat, produced these fossil shapes. Mercati stoutly maintained that the fossil shells collected in the Vatican by Sixtus V., were mere stones, which had received their configuration from the influence of celestial bodies; and the celebrated physician, Falloppio, asserted that they were formed, wherever found, by “the tumultuary movements of terrestrial exhalations.”* Nay, this learned author was so adverse to all idea of deposits, as boldly to maintain that the potsherds, which form the singular mound, known to you all under the name of Monte Testacea, were natural productions—sports of Nature to mock the works of man. Such were the straits to which these zealous and able men found themselves reduced to account for the phenomena they had observed.

* This is quite as good a reason as “circumstances,” or “combination of circumstances,” for life and organization.

CHURCH OF SCOTLAND.

THE spirit of innovation is hovering over this relic of scholastic divinity. The orthodox, or popular party, is rapidly making head against the old Tories of modernism. The orthodox are a species of Whigs in Church politics—in so far as respects popular rights, and the overthrow of old established usages; but they are stern John Calvinists and John Knoxites in faith, and seem to be several centuries behind the Whigs in gentlemanly feeling and behaviour. However, they form the movement party in the Scotch Church, and the rapidity of their progress on the question of the abolition of lay patronage, may be perceived by the following successive divisions on the question. In 1833, only 33 had the courage to vote against Patronage; in 1834, 42; in 1836, 90; in 1837, 97, there being 166 for keeping things as they are. For a reform of the eldership, which is in a most corrupt state, being, with the characteristic servility of the clergy, unscrupulously bestowed on many, especially young lawyers, who only use it for political purposes,—there were, last May, 131; 154 were in favour of things as they are. But, strange to tell, 61 elders voted for the reform, and only 56 against it—showing that the laymen are (in Scotland, as well as elsewhere) better reformers than the clergy. The Church-extension system is rapidly progressing upon the voluntary principle. Last year there were £60,000 contributed to the fund. Within the last three years £160,000 have been collected, and 157 new churches have been, or are being built, in consequence. Yet still the Church vociferously complains of the infidelity and supineness of the Whigs, in refusing to give grants from the consolidated fund, to build more.

CAVERNS IN BELGIUM.

Liege, June 13.

SOME time ago a large cavern, full of beautiful stalactical formations and incrustations, was discovered near Tilf. A se-

cond, far more splendid than the first, has just been discovered. It is a prolongation of the former, and every thing in it is grand and magnificent. The various halls, if we may so call them, resemble the naves of cathedrals. On the right and left are stalagmites, rising in stages to a great height, which look like glaciers, and extend further than the eye can reach. From the top of one of them, which is between 60 and 70 feet high, rushes a superb cascade, which falls into an alabaster basin, to which the name of Bath of the Nymphs has been given. Beyond this second grotto there is a third, which has not yet been explored. The persons who have discovered these caverns have already penetrated above a league into them.

MARCHING TO PRAYERS.

“THE British officers of the native army have no Sunday parade, as their men, being of a different religious persuasion, are not expected to attend Protestant worship. To avoid the infliction of a headache, which a two hours’ respiration of the riding-school atmosphere was sure to entail, most of the officers remained in their own dwellings. In 1830, the Commandant insisted on their attending, and ordered them to assemble every Sunday morning on the parade-ground, and march to prayers at the head of the 11th dragoons.”—*Dr. Spry's Modern India*, 1837.

TO CORRESPONDENTS.

As we shall always go early to press with the Shepherd, our Correspondents will require to be several days in advance. Our old friend, the Transcendentalist, was just in time to escape the “lock up” for a week. Hermes is remanded. T. is requested not to realize his intentions expressed in a private note. We shall be offended if he do. It is not necessary. Let him chisel away at time and space, and leave the grosser elements of sense to those who are more materialized than himself. We hope he understands mysticism; if not, he must go and take lessons at the Marylebone workhouse. We shall explain this latter allusion:—We met Mr. Wigram in the street on proclamation-day. He had just come from reading Fraser's Magazine; his eyes were bleared with the brilliancy of the critique on Transcendentalism, and the blue, red, and yellow books. He put into our hands a blue, red, and yellow bill, entitled, “Universal Picture Lessons for Infant, National, and Normal Schools, by Thomas Wigram, Esq.” &c. In this bill, he informs us, he teaches mental philosophy at the Marylebone Workhouse, where the public are invited to attend on Tuesdays, at 11 o'clock. The following announcement in the bill will be read with astonishment: “The true arena for the science of mind is the Marylebone workhouse.” If this do not make the literati of Oxford and Cambridge blush to the very occiput, they must be as devoid of shame as Eve and Adam before they fell. To be outstripped in metaphysics by a set of pauper brats! We must see this great sight, and give our readers an account of it.

Next week we will enter upon the discussion of a very important question respecting Mr. Owen and the Jesuits, which will probably occupy us for two or more weeks, and lead to other interesting topics, all of a practical nature. In one sentence we shall wipe off the reproach that the *Shepherd* has no practical tendency.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Pantheism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 2, Vol. III.]

SATURDAY, JULY 8, 1837.

[PRICE 1½d.]

ROBERT OWEN, THE PROTESTANTS, AND THE JESUITS.

SUBORDINATION is the soul of a system. In order to make a system work well, it must have superior powers to dictate, and inferiors to obey. The inferiors are the mass of the people: the superiors are few in number.

Every man should have his appointed place—his prescribed task; a task which he performs, not for his own sake alone, but for the sake of the community.

This cannot be without gradation of rank, and an absorption of the voluntary by the involuntary principle.

The Society of Jesus, i. e. the Jesuits, regarding it merely as a working system, independent of its principles, is the most perfect model of organization which has ever yet been tested by experience.

The great object primarily aimed at in its organization was unity. To produce this unity, the first sacrifice required of the members was, a renunciation of all individual property and individual affections, "*existimet sibi quicquid in mundo habebat relinquendum*," i. e. let him understand that he has relinquished every thing he has in the world; "*et ita curandum est ut omnem carnis affectum ergo sanguine junctos eruat*," &c. i. e. let him also divest himself of all predilection for blood-relations, the true principle of relationship being that of the spirit.

The individual was sunk in the universal interest.

So far Mr. Owen and Ignatius Loyola agree. But it was not enough merely to inculcate a principle; laws must be enacted to carry it out, and ministers must be appointed to execute the law, and obedience must be exacted in carrying out the plans of the institution; for if the mode of action is not uniform, there can be no important object effected. The results must then be accidental.

To accomplish this practical end, the superior was invested with supreme authority; and every inferior ruler had undisputed power over all beneath him, according to the principle of military discipline. There was no gainsaying an order; if a member were ordered to scrub pots, or wash dirty linen, he must yield without a murmur; and this humiliation was frequently employed with proud and haughty spirits, who overrated their own importance, and seemed more disposed to follow the voluntary than the involuntary principle.

Not even a private correspondence could be carried on without the privacy of a brother, appointed by the superior to read the letter, and to receive the answer.

But how was this discipline enforced? Not by magisterial authority, or bodily coercion: no, indeed. It was enforced by a higher and more ethereal principle; a mere imagination, which is the strongest of all principles. This was the very marrow of the institution. It could never have been organized without it. No practical system ever was organized without it, unless upon the principle of military coercion. If such a system be possible, the experiment has yet to be made. We should like to see it tried.

But what is this imagination, this powerful dictator, which enforces obedience to the most revolting duties, and subdues the selfish to the social motives, and how can it be produced?

There are many different species of it, both religious, social, and political. That of the Society of Jesus was religious faith—Christ was the head supreme—the Pope was second to Christ, and the representative and interpreter of his will—the Superior of the Order was next in order to the Pope—the subordinate authorities came next, and each of these authorities had power supreme over those beneath him, "who are commanded to listen to his voice, as to the voice of Christ." According to rule 39th, they were taught not to consider whom they obeyed or whom it was who ordered, but him *for* whom they obeyed, that is, Christ the Lord—the object of their obedience being the good of mankind, "universal love." (Rule 44th.)

Now the important query with us is, the possibility of organizing a practical working system upon any other model than this—without one or more of its ingredients. The principles of Jesuitism, recollect, are at present out of the question; we do not advocate them; but we think the order has been sadly misrepresented, and many of the crimes which they have committed, in the political and social world, have been wide departures from the principles of the fraternity. What we are discussing at present is a working practical system. Some people have said the *Shepherd* is not practical, it has not a practical tendency: we shall bring such people to the test, and try whether they or we best understand the principles of a practical system.

The great complaint we have against all systems at present is, their deficiency in this respect, and the new systems seem to be more defective than the old. The new carry the democratic principle to excess, the old had too little of it; but as executive power and facility of action do not belong to the democratic principle, the monarchical have always possessed more influence, in proportion to their size, than the democratical societies. A plan could be adopted, and put in force instantaneously by their means; an opportunity of action could be seized, and taken advantage of; the whole power of the body could, in a twinkling, be directed to a particular point, and that point carried, if combined energy was able to attain it. It was this combined energy which enabled the Jesuits to accomplish such immense undertakings, with apparently trifling means. They have made more converts to the Christian Church than any other Christian body. The principal conversions in the East, nay, almost all the conversions to Christianity there, have been made by the Jesuits; and Abbé Dubois, in his examination before the House of Commons, estimates the native Catholic population of Asia at 1,200,000, of which there are 600,000 in India. The Protestants never have succeeded as missionaries; not because they have not got "Christ the Lord" to inspire their zeal, but because they never have been organized upon the Catholic principle, which is the only practical system, and would still work most efficiently, even amid our own population, were it not for the obstinacy with which it adheres to obsolete forms and stupid dogmas, which the common sense of the people condemns. But what is worthy of minute observation, it is chiefly owing to a departure from the old Catholic organization that this obstinacy exists. The Pope's power has been weakened—he cannot trust to the allegiance of his subjects; he therefore merely suffers the old

wheels to roll on, oiling and greasing them a little, to keep himself easy. He dares not to make innovations, like his predecessors, suited to the spirit of the age. It was upon this principle of progression that Catholicism arose, and by forsaking this principle it must fall.

The Scotch Church has determined, that there be no acknowledged head of the Church but Christ; but as Christ never visits the assembly in person, and as there are many disputes about Christ's will in respect to particular measures, this head becomes a divided head, in the general assembly of the clergy. Were Christ really and intelligibly present, they would be united. To remedy this defect, the old Catholic principle gave Christ a representative, and put him in the vicarial seat. This at once gave unity and force to their proceedings: Christ was no longer divided. Here, now, was an interpreter of his will, and the Church universal believing that the spirit of Christ was with his Church, nothing was more natural, than for them to believe, that he would speak his mind through the visible head. Prosperity attended the system, and if it has fallen, so also have the tabernacle of Moses, the ark of the covenant, the temple of Solomon, and the working of miracles. But each did its work while it continued, and the fruits of that work are still visible, and the lessons most important.

Our English Church is, perhaps, more defective, in some respects, than the Scotch; for although the Queen (God bless her) is head of the Church, having the grace of God in her heart, and an excellent store of sound theological books in her library, still her Majesty never does act theologically in the Church, and the clergy only regard her as their head in a *passive* sense; that is, a head which *does not* rule the body, but is *ruled by it*! A brainless head, we fear, since the brain is scattered, God knows where, and is never collected for unique action; so that the English Church remains stock-still where it was first placed, retaining its old unchangeable character, and not possessing the elements of a new growth within itself, for want of an active head.

This is the case with the whole army of Protestantism. It is a miserable, sickly system, a mule begotten by Catholicism upon the mare, or she-ass, of democracy, but quite unable to propagate its own likeness, for want of the principle of germination.

Zeal is not a-wanting in the Protestant Church. The large funds of the Bible and Missionary Societies afford undeniable proof of this. The yearly income of the Wesleyan Missionary Society is nearly double that of the "Propaganda Fide." A Roman bishop in India has only £60 per annum; a priest, with a congregation of three-thousand, only £30; yet to these men all the native Christian population belongs. Zeal is like steam; it is very weak, when scattered and rarified, but very powerful when condensed under high pressure. The Protestant steam has too many valves. The directing principle of Christ the Lord is rather too accommodating, when not directed by some visible head. The invisible head is very useful as a living motive for the conscience: but the visible head is equally useful for method in action. The invisible head will never direct methodically, except through the medium of a visible head. It is a law, an eternal law of God and Nature, that power be methodically exercised *only one way*, under the direction of a visible head.

Now, observe this fact. Protestantism has rejected the visible head—Owenism rejects visible and invisible—Catholicism employs both. Which of all these three is the practical system? The natural one. There is no other system but the Catholic, the others are not systems at all, and when the Catholic fails, it fails, solely because it does not carry out its own first principles. We fear that a great proportion of our modern Reformers are disposed to reject both heads, (which are only one) and to raise an atmosphere of dust, by setting up, each individual for himself, upon the voluntary principle! Wherever such ideas prevail, there Chaos reigns supreme, with Necessity his Queen, and their family of Circumstances, Mr. McAdam as superintendent of public works, and Mr. Whirlwind as his principal assistant.

How very simple and beautiful are the fundamental practical principles of life, unity, subordination, zeal; and how

strange the infatuation that will lead men away from them, to entertain the hope of organizing a practical system without them!

The feature of insubordination at present belongs to all modern revolutionists. In fine, many of them regard it as a fundamental principle of a new, instead of an axe for hewing down an old, system. But all the sober and intelligent among them do really acknowledge the evil, and bitterly complain of it. They are already inwardly convinced, that the people can not be collected around any popular standard which is waving at present.

The strongest and best compound of zeal must reign over weaker and worse compounds. The more universal a zeal is, the stronger and better it is. A mere political zeal is not so strong as a political and religious zeal combined. "The great Missionary Association at Lyons," says Dr. Wiseman, "which realizes about £15,000 a-year to the 'Propaganda,' has entirely, from first to last, been commenced and kept together by a lady, who has not been able, from illness, even to leave her own chamber. She is a perfect cripple; and, consequently, has done it all by her correspondence, and her energetic representations." What but the religious element can afford such a lever? Radicalism and Reform have cut up the principles of human action into so many fragments, that the people do not know rightly where to blow their zeal. In the confusion they blow in opposite directions; and when they do all blow in the same direction, it is never for a first principle, but some miserable trifle, which, when obtained, only gives occasion for fresh murmurs.

Owen is more collected in his views, and more intelligible in his plans, than the mere Reformers. But, can he create zeal—can he create subordination—can he create unity—can he embrace industry, learning, science, and the arts—can he keep up the flame of Imagination? Has he a *hot-house* for rearing tender plants, to be transplanted to the fields when their native propensities are developed, and they are ready to encounter the accidents of wild Nature?

Every opinion can create zeal to a certain extent. But the more universal the zeal is, the more likely it is to succeed. Poetic zeal is not universal, it belongs to individuals. Musical enthusiasm is also a rarity, and confined in its application. So are painting, sculpture, mechanics, &c. All these are merely departments which never can take the lead in a social movement; but they may act a subordinate part. There are only two universal species of zeal,—corresponding to the double aspect of our nature;—the religious and political. These really are universal. The two combined embrace every idea connected with the general happiness of society. They live in all. The religious, as a male principle of action, resides principally in males; but also very extensively in females. The political, as a female object of action, takes refuge chiefly with males. A mere political, or social system, that excludes religious feeling, will never interest the female nature. (It never can interest the male. If woman is the representative of the Church, man is the high priest of the Temple.)

Religious zeal is eternal. It is not necessary that it should always be the same, however. It is like wealth, it may be variously directed. Hitherto, it has been sectarian, and worked mischief by its antagonism, and its social antipathies. Patriotism has done the same. But there is a higher order of zeal in man, which may, and will be aroused for the accomplishment of a higher object than any which is at present practically before the public.

The zeal we speak of is a truly Catholic zeal—which begins with God as the invisible head of the system,—which ordains a representative of God upon earth, visibly to direct this system, with his subordinate authorities, and then relies with implicit faith upon this as a Divine, an infallible institution, which cannot be destroyed.

We say, there is such a zeal, and such a faith; and that the system above mentioned, in a single sentence, is the only practical working system.

But, pray, how are we to know that this system is a Divine and will be a successful system? By its Catholicity, or Universality. If it be universal in its principles, it is the religion of

the Universal Spirit, to a living certainty; and the faith that reposes upon it, is not a faith at all, but knowledge and demonstration. (Faith shall cease with fruition; in this sense alone, we are, or rather wish to be, infidels, for we desire to see faith swallowed up in demonstration and full enjoyment). Whenever you have got universality, you have God in your head, and his sceptre of humanity in your hand. But the zeal and the faith we speak of will never come to Necessity and Circumstances. You may just as well take an Egyptian mummy for a standard.

If we have no confidence in the head of a system, we can have no confidence in the system itself. The head is the ruling member. It receives its strength, its nourishment, from the other limbs; but, whenever the inferior limbs exhibit a revolutionary spirit of their own, in working without the consent of the head, disease is the cause. A healthy state of body always gives a supreme authority to the head. It is only in convulsions and disease that the head loses its power. Is this a fact? Are you a matter-of-fact philosopher?—then receive the fact, and the inference we draw from it;—*viz., that the more practical a system is, the greater is the power which is exercised by the head.* Does your liberalism start at this? then it is a false liberalism, for there is no freedom equal to that which is accompanied by a sound head and subordinate members. There is no slavery equal to that of unruly members which despise the head and its authority.

It was upon this principle that the Jesuits acted in their social capacity, and no organization was ever more complete. It was a splendid unity. Every individual feeling was lost in the universal interest; but lost in such a manner, that the interest of the order became a sort of selfish interest, and the individual received a new self, by regarding himself as a part of a mighty whole. Even, when convinced that the superior was wrong, he perceived the necessity of yielding to his authority; persuaded that it was better that the superior himself should commit a blunder, with authority unimpaired, than that his authority should be destroyed by controversial factions. An error is easily corrected when authority is preserved; but once lose your dictatorship, and blunders are irremediable.

Moreover, we think this organization alone compatible with the greatest degree of personal liberty. It is well known that the Jesuits were the most free, and most devoted of all the Catholic orders! The bondage is more nominal than real. When a system is well organized, and put in motion, the controlling power is so mixed up with the general will of the machine, that it is never perceived, unless when some obstruction occurs, and it exerts its force to overcome it. The generalship was elective. The head was chosen by the members, and voluntarily invested with authority; but, when chosen, he was a head in deed, and not in name only. It was the voluntary principle choosing one master to escape from many.

Next week, we shall continue this subject, and compare some of the marvellous doings of the Jesuits, with the feeble attempts of the headless and the faithless systems.

BLACK AND WHITE.

EXPOSURE to the rays of the sun is known to deepen the complexion; yet this cause appears to some writers hardly sufficient to impart so dark a hue as that of the Negro. Another agent has been brought in to help it out; and this is the influence which the heat of a tropical, or often of an autumnal climate, exercises upon the secretion of bile. Dr. Smith (of New Jersey), is of opinion, that "the principle of colour is not to be derived solely from the action of the sun upon the skin." "Heat produces relaxation," "the bile, in consequence is augmented, and shed through the whole mass of the body. This liquor tinges the complexion of a yellow colour, which assumes, by time, a darker hue." "Bile, exposed to the sun and air, is known to change its colour to black; black is, therefore, the tropical hue."

"Blumenbach," says Dr. Pritchard, from whom the above is extracted, "has speculated in a similar manner on the cause of a black complexion, and its connexion with the secretion of

bile." But, as the Doctor observes, "Negroes have bile of the same colour, and nearly in the same quantity, as other men; and it is an undoubted fact, that they are more exempt than other races from the morbid influence of hot climates, which, in Europeans, often gives rise to disease of the liver or of its functions."

Moreover, it is not a fact that climate produces that change of colour which is here alluded to. The genuine English breed is observed to be equally pure in Jamaica as in the mother country, according to Long's History of Jamaica; and there are many such families there who have been inhabitants of the island for nearly two centuries. The Nevayets, or Moslem settlers, in Concan, migrated from Irak to the western coast of the Indian peninsula, in the first century of the Hejira (about 1200 years ago). They systematically avoided intermarriages with the natives—even with Mahomedan families, for many centuries after their establishment, in the Deccan. "Consequently," says Major Wilks, in his History of the Mysore, "they have preserved their complexion, and there are even now some Nevayets whose countenances approach the European freshness."

We are informed by Dr. Claudius Buchanan, that there are among the Jews at Cochin, on the coast of Malabar, two descriptions of people, who are termed the white or Jerusalem Jews, and the black Jews. The former have kept their race distinct. It appears by their records, which were considered by Dr. Buchanan to be authentic, that they migrated to India soon after the destruction of the Temple of Jerusalem by Titus, and that they afterwards obtained grants of territory and privileges, of which they have documents, bearing date in the year of the world, 4250, or A. D., 490. These people are said to resemble the European Jews in features and in complexion. The black Jews are a mixed race, descended, in great part, from the natives of the country, whom they resemble in physical characters.

It is certain that several generations have produced little or no alteration in the complexion of Negroes in the United States, and other temperate climates, where black slaves and free Negroes are to be found, although the features and hair of such persons, are said to differ considerably from those of native Africans. I have, indeed, says Prichard, been assured repeatedly by the West Indians and Americans, with whom I have conversed on the subject, that the domestic Negroes, who are protected from the heat of the sun by more clothing, and who pass their time in sheltered houses, are of a darker complexion, than the slaves who labour half naked in the fields. The better a Negro is fed and clothed, and the more healthy he is, the darker is the colour of his skin."

There are powerful facts, however, opposed to the above. Mr. Jackson mentions the difference between the Arabs who dwell in towns in Morocco, and the Bedouins who live in tents; the former being fair, the latter dark. Volney observed the same difference between the sheiks among the Bedouins themselves, who are well fed, and their subjects, who live on a poor law amendment allowance of six ounces of food a day.† Mr. Forster makes the same observations on the people of Tahiti. The common people, who are stinted in their food, are blacker, their hair more woolly and crisp, their bodies low and slender. But their chiefs and aroes, have a very different appearance. "The colour of their skin is less tawny than that of the Spaniard, and not so coppery as that of an American. It is of a lighter tint than the fairest inhabitant of the East India Islands. From this complexion we find all the intermediate hues, down to a lively brown bordering on black."

Dr. Wiseman has, in our opinion, hit upon the most rational and sober method of accounting for the black and white. He has, in the first place, adduced the sporadic varieties, as he calls them, which occasionally spring up among plants and animals, and which if not destroyed by intermixture, become permanent and hereditary. Thus the porcupine man, whose body was covered with a hard stony crust, has three generations de-

* The Moorish females, who kept the houses, are almost perfectly white, the two facts therefore, do not correspond.

† Volney's Voyages in Egypt and Syria.

scended from him, partaking of the same peculiarity. Once a year this horny substance is shed, and revives—it also yields to the action of mercury, but grows again. If this family continue to propagate, they may beget a new race of men as distinct as black from white. Yet, this peculiarity, evidently originated in a disease, which has now been appropriated by the constitution, and rendered compatible with a state of health and activity. There is also a race of people called Sedigiti, amongst our own population, who have six fingers, and six toes, on each hand and foot, and who propagate this peculiarity by descent. Sir A. Carlisle has traced the history of one of these families, through four generations. Maupertuis has mentioned other instances in Germany. The same may be said of inferior animals. We see, therefore, the possibility of a black variety of mankind, originating by what is called accident or disease, and becoming permanent and healthy. Nay, there are *Albinos*, or white varieties, amongst the Blacks, who are also diseased; who also communicate their peculiar complexion to their children; and who, supposing all men to have been originally black, may have become the founders of the white variety; the white being appropriated, and accommodated to the human constitution.

The subject is not so very difficult as is commonly imagined. There is no supposition more complex and absurd, than that of several original distinct species. The now well known laws of comparative anatomy and reproduction, have entirely banished this idea from the philosophic mind; and we, now, only look about for analogous facts to point out modes in which each variety *might*, agreeably to the well known laws of Nature, have originated.

The white and black races are merely types in outward Nature of the good and evil principle, the bipolar extremes—hence by analogy, the immemorial subjugation of the blacks to the whites; and as light arises and moves in darkness (darkness being entirely passive), so the light of civilization, and the movement of science, arose not by means, but in the midst, of a negro population. We question much, if Nature will ever permit the extinction of the black. Future generations will, probably, be better able than we are to appreciate their value in the household of God.

THE NEGRO TESTAMENT.

WE suspect the zeal of the Bible Society sometimes eats up the funds, without receiving much nourishment from the repast. The mere list of languages, into which the Scriptures have already been translated, has an imposing effect upon the unlearned. And who is not unlearned? Who is there, amongst all the literati of Europe, who can read Telinga, Hinduee, Goozurattee, Kunkuna, Assam, Kashmeera, Nepala, Mahratia, Vikanera, Tamul, Canarese, Mooltan, Oressa, Singalese, Harottee, Wendish, Telogoo, Pushtoo, Tartar, Turkish, Coptic, Amharic, Russian, Polish, Carshun and Syriac, with a hundred other translations, of Bibles, Testaments, Pentateuchs and Psalters, that issue from the cloven-tongued apostlehood of Earl Street? Even the Committee, and their vicegerents, the clerks in office, or their patrons, out of office, can do no more than *believe* that these translations are real. In many, perhaps the most instances, they are correct; but, in respect to all savage languages, all languages which have not been methodically arranged according to grammatical rules, we are morally certain that the translation can be nothing but a hoax.

In order to make these translations, a missionary associates for a time with rude uncultivated natives, he catches the sound by the ear, and spells it accordingly. His teachers are illiterate barbarians; they cannot even pronounce their own language, any more than a Cockney, or an illiterate native of Yorkshire or Lancashire, can speak English. The prince is as rude as the peasant; and, for want of a standard of pronunciation and grammar, the dialects are as numerous as the districts. A river, a mountain, a bog, intervening between two such tribes of uncultivated rationals, is enough to create a diversity of pronunciation, tantamount, in a stranger's ears, to an original difference of language. Who could translate the Bible into English, by picking up a limb of the sovereign people in Lon-

don, as a specimen for the whole community; or make up a dictionary of the English language from the mouth of a native of Manchester or Bradford?—

QUES.—*Wair dosth liv Jim?*

ANS.—*Uppé toppit street.*

This is the mode in which the following question and answer would be printed:—

QUES.—Where dost thou live Jim?

ANS.—Up at the top of the street.

Now, who amongst us, seeing these two words, "*uppe toppit*," would take them for natives of England? Yet they are spelt by the ear, and are, we believe, as literally correct as many of the savage Testaments of the British and Foreign Bible Society, which are as unintelligible to the natives, as "*uppe toppit*" is to an Englishman.

The Negro Testament is a curious specimen of this mode of manufacturing a Bible. We are informed, upon pretty good authority, that the Negroes themselves cannot understand it. It is merely a burlesque of the "*massa*" style of speech, spelt according to the Dutch orthography, and thus manufactured, so as to seem to an English eye, to be a distinct Foreign language. By analysing it, however, we will discover black Sambo, in his Dutch dress, "*talkee nothing but Ingleesee*." Thus, in the first chapter of St. Matthew's Gospel, 20th verse, we find the following words:—"An Angel of the Lord appeared unto him, in a dream, saying, Joseph, thou son of David, fear not to take unto thee, Mary thy wife, for that which is conceived in her, is of the Holy Ghost," are thus translated—"Wan Engel, vo masra, kom lan na hem feci na drem, a takki Joseph, joe pikien va David, no fredde va teki Maria, joe weiji, na joe hosso bikasi da belle vo hem, va worko va santa jeje." The letter *j* should, according to the Continental custom, be pronounced *i*, and *i* sounds *e*, joe sounds *you*. Making other allowances for the Dutchman's orthography, the translation, in real *massa* language, is as follows:—"An Angel fo Massa, come tand in him facee en a dream, and t lkee Joseph;—you pickinianny (son) fo Dabid, no fredde (don't be afraid) to takee Mary, you wifese, in you housee because de belly of him (her) da worko va santa yeje" (is working with the Holy Ghost).

Verse 23rd.—"Behold a virgin shall conceive, and bear a son, and shall call his name Immanuel, which being interpreted is, God with us," translated thus, "*Loekkoe* (looksee) *wan njoe weendje* (one new wenchsee) *sa kissi belle* (kisssee belly) *a si gebore wan manpikien dem sa kali* (callee) *him Immanuel effi na wi tongo* (in our tongue) *Gado nanga wi*" (we).

Chapter 2nd, verse 7th, "Then Herod, when he had called privily the wise men, inquired of them diligently what time the star appeared;" translated thus, "*En Herodes kali dem koenniman kiebrifasi* (cunning man coveree facee) *a haksi dem boenboen, sinde hoetem* (since what time) *dem ben si da staur*" (dem been see de star).

Heaven is translated "*gadokondre*," God-country; Judea "*djoe kondre*," Jew-country; a virgin is called a "new wenchsee." Mother is called *mamma*, woman, *oeman*. Thus the words of Jesus, on the cross, when he saw his mother standing beside John, "woman, behold thy son!" are translated "*oeman datti da joe (you) pikien*." "Then saith he to the disciple, behold thy mother; and from that hour that disciple took her unto his own home," elegantly rendered "*En dan a takki na da discipel: loekkoe datte da joe mamma! En soe joesnoe* (just now) *da discipel teki hem* (take her) *na hem hosso va loekkoe hem*." The agonising cry of the Saviour on the cross, "I thirst," is most pathetically translated, "*mi dreveatra*," "me want to drawwater." Where one of the thieves railed on him, and said, "If thou be the Christ, save thyself and us," the Negro Testament thus translates it: "*Effi joe da Christus helpi joe srefi nanga wi*," i. e. "Iffe you de Christ, helpee selfee and we." "But the other answering, rebuked him, saying, dost thou not fear God, seeing thou art in the same condemnation?" thus transformed, "*Ma da tarrawan* (t'other one) *strafe hem a takki; en joe toe* (and you too) *joe no fredde Gado di joe dedde* (dead) *na da srefi pinna*" (same penalty).—"Lord, remember me when thou comest into thy kingdom!" "*Masra membre mi teh joe kom na joe kondre*," i. e. "Massa, member me, te you come 'na you country."

Such is a specimen of the Negro Testament, published a few years ago by the British and Foreign Bible Society, for the conversion of the Black men of the West Indies to Christianity; but the Blackees do not "undertand" it. "Dey undertand massa talkee berry well; no undertand dat talkee; wonder fat white man printee bookee dat way for."

It is not improbable that many other of the Society's productions are equally ridiculous. We entertain no suspicion of

any of those of the well-formed and cultivated tongues, such as Arabic, Syriac, Persian, Turkish, and other languages, fixed and established by a literature of their own; but any attempt to put the jabber of savages into print must be almost unintelligible to the savages themselves, and much less profitable to them and the world than teaching them a new and full-grown language, which would scarcely be attended with more trouble, either to the teacher or his pupils.

COMPARISON OF LANGUAGES.

| | Russian. | Persian. | Sanskrit. | Greek. | Welsh. | Irish. | Latin. | Franco-Theutish. |
|---------|----------|----------|-----------|--------------------|--------|--------|---------|-------------------------|
| one | odin | ec | eka | en | un | nen | unus | ein |
| two | dua | du | dui | duo | dau | da, do | duo | tue |
| three | tri | se | tri | treis | tri | tri | tres | thri |
| four | chetaire | chehar | chatur | tettares | pedwar | ketair | quatuor | fiuuar, fidwor (gothic) |
| five | pat | penj | pancha | { pente pempe } | pump | kuig | quinque | finfe |
| six | shest | shesh | shash | hex | chwech | se | sex | sehs |
| seven | sem | heft | sapta | hepta | saith | sech | septem | sibun |
| eight | vosem | hesht | ashta | octo | with | oelht | octo | ohto |
| nine | debyat | na | navam | ennea | naw | noi | novem | niguni |
| ten | desyat | deh | dashan | deca | deg | deich | decem | tehan |
| twenty | dvatsat | bist | vinghati | eikonti | ugain | fiche | viginti | tuengtig |
| hundred | sto | sad | shata | hecaton | cant | kett | centum | hunt |

I have only room to remark that most of the differences which occur in the above words are according to a regular method of deviation, which may be traced in many other parts of the vocabularies of the respective languages. Thus, for the Sanserit *eh*, the Greek substitutes *t*, the Welsh *p*, the Irish and Latin *k*, or *q*.—*Prichard's Physical History of Mankind*.

EASTERN, OR PATRIARCHAL GOVERNMENT.

THE East is the monarchical, the West is the democratical extreme of government. In the East we expect the greatest tyranny, in the West the greatest liberty. But it would be a very difficult thing to determine whether despotism or popularism have yet produced the most beneficial effects on the working classes. The arts and sciences have evidently flourished most healthily under the latter—but there are some peculiar blessings which belong to the former alone, which, in western climes, we have laboured in vain to realize. Before, however, making any more observations upon this subject, we shall give the reader a few interesting extracts from Mr. Davis's China, on the influence of public opinion, and the prevailing ideas of a practical system in that patriarchal country.

"There are some curious practical anomalies, which one is not prepared to find under a despotism. The people sometimes hold public meetings by advertisement, for the express purpose of addressing the magistrate, and this without being punished. The influence of public opinion seems indicated by this practice, together with that frequent custom of placarding and lampooning (though of course anonymously) obnoxious officers. Honours are rendered to a just magistrate, and addresses presented to him, on his departure, by the people, which are highly valued. These must be ranked with the exceptions to the theories of government, of which *Hume* treats, when he mentions, among other instances, the impressment of seamen in England as a departure from freedom, as the cases above mentioned are a departure from despotism. It may be added, that there is no established censorship of the press in China, nor any limitations but those which the interests of social peace and order seem to render necessary. If these are endangered, the process of the government is, of course, more summary than even an information filed by the Attorney-General.

"It is deserving of remark, that the general prosperity and peace of China have been very much promoted, by the diffusion of intelligence and education through the lower classes. Among the countless millions that constitute the empire, almost every man can read and write sufficiently for the general purposes of life, and a respectable share of these acquirements goes low down in the scale of society. Of the sixteen discourses which are periodically read to the people, the eighth inculcates the necessity of a general acquaintance with the penal laws, which are printed purposely in a cheap shape. They

argue, that as men cannot properly be punished for what they do not know, so, likewise, they will be less liable to incur the penalty, if they are made duly acquainted with the prohibition. This seems a very necessary branch of what has been called (by Blackstone) '*preventive justice*, upon every principle of reason, of humanity, and of sound policy, preferable in all respects to *punishing justice*.'

"The general diffusion of education must be attributed to the influence of almost every motive of fear or hope, that can operate on the human mind. It is inculcated by positive precepts, and encouraged by an open competition for the highest rewards. One of the strongest motives to every Chinese, to educate his sons, must be the consciousness, that he is liable to punishment for their crimes, at any period of their lives, as well as to reward for their merits. Parents are often promoted by the acts of their sons. Montesquieu, in violently condemning the liability to punishment, seems to have been unaware, or unmindful, that it is, in some measure, the result of that absolute power which is through life entrusted to the father, and that such a trust, with some show of reason, carries with it a proportionate responsibility. He is not only punished, but rewarded too, according as he has administered the trust. How such a system must operate as a motive to education is sufficiently obvious. And the only question is, whether the amount of personal liberty sacrificed, is balanced by the amount of public benefit gained. So sensible are they of the importance of education, that the language is full of domestic or of State maxims in reference to it. "Bend the mulberry tree when it is young,"—"without education in families, how are governors for the people to be obtained?"—and so on. Every town has its public place of instruction, and wealthy families have private tutors.

"As regards the peaceful and orderly character, by which the Chinese as a nation are distinguished, there is much truth in another remark of Montesquieu; namely, that the government had this object in view, when it prescribed a certain code of ceremonies and behaviour to its subjects. 'A very proper mode of inspiring mild and gentle dispositions, of maintaining peace and good order, and of banishing all the vices which spring from an asperity of temper. They are certainly, upon the whole, the most good humoured people in the world, and the most peaceable. And the chief causes of this must be sought for, in their political institutions.' * * * * * Here, perhaps, we may perceive also the sources of their cha-

racteristic timidity, which is accompanied by its natural associate, the disposition to cunning and fraud.

"Wealth alone, though it has, of course, some necessary influence, is looked upon with less respect, comparatively, than perhaps in any other country; and this, *because* all distinction and rank arise almost entirely from educated talent. The choice of official persons, who form the real aristocracy of the country, is guided, with a very few exceptions, by the possession of those qualities; and the country is, therefore, as ably ruled as it could be, under these circumstances. The official aristocracy, content with their solid rank and power, aim at no external display. On the contrary, a certain affectation, on their part, of patriarchal simplicity, operates as a sumptuary law, and gives a corresponding tone to the habits of the people. We are bound to admit, that some evil results from this. Superfluous wealth in the hands of the vulgar possessors of it, is driven to find a vent, occasionally, in the gratifications of private sensuality.

"Superfluous wealth, however, is no very common occurrence in China. A man's sons divide his property between them, or rather live upon it in common, and the only right of primogeniture seems to consist in the eldest being a sort of steward, or trustee, for the estate. The temptations to immoderate accumulation, are not so great as with us, nor the opportunities for it so frequent, where the ordinary channels are liable neither to such spring tides, nor to such violent ebbs. We must repeat that the fortunes made by Hoppo and Hong merchants, at Canton, are no examples, whatever, of the usual state of things in the Empire, in cases where natives only are concerned. The real aristocracy of the country, being official and not hereditary, there are no families to be perpetuated by a system of entails; and if a man were willing to transmit his possessions in the shape of endless settlements, the law will not let him.

"It is an observation of Hume, that the absence of any hereditary aristocracy may secure the eternal tranquillity of the state, by making it impossible for faction to find any powerful heads.' This we fancy is exactly the principle, upon which the Chinese government is so jealous of any undue perpetuation of greatness in families. There are certain hereditary titles descending one step in rank through five generations, and the privileges of wearing the yellow and red girdles, which serve to distinguish the numerous descendants of the imperial family, but these, though they are a class of titular nobility, are far from being the real aristocracy of the country; and, without personal merit, they are little considered. The Chinese have a saying, 'by learning, the sons of the common people become great; without learning, the sons of the great become mingled with the mass of the people.'

"The impartial distribution, with few exceptions, of state offices and magistracies to all who give evidence of superior talents, without regard to birth or talents, lies probably at the bottom of the greatness and prosperity of the Empire. Nothing can be more true than the observations, on this subject, of the late Dr. Milne, an excellent Chinese scholar. 'This principle has always been maintained, although, as may naturally be supposed, it has often in practice been departed from. Yet the existence of the principle, and its being acted on to a considerable extent, gives every person in China (with the exception of menial servants, the lowest agents of the police, and comedians) a solid reason to be satisfied with the system. They are the ambitious, who generally overturn governments. But in China there is a road open to the ambitious, without the dreadful alternative of revolutionizing the country. All that is required of a man, is the very reasonable thing, that he should give some proof of the possession of superior talents.'

Next week we shall give some idea of the Despotism.

EGYPTIAN ARCHAEOLOGY.

A NEW science is gradually rising into being by the zeal and perseverance of antiquarian curiosity—a science not less certain than geology itself; although it only treats of the ancient works of man, whilst geology is directed to the study of the works of the primary Creator. The inscriptions of antique

monumental relics, found among the ruins of Luxor and Thebes, are now becoming legible. The characters which for a long time presented nothing but unmeaning forms, to our most learned Archaeologists, are now, by the aid of a little imagination, assuming a definite and intelligible aspect. This supposition, like that by which we work out an algebraic calculus, leads to a certainty at last, by coinciding with the conclusions. Thus, for instance, we perceive on a stone two names which we cannot read. We do not know the alphabet; but we know something of the history of the nation, and the names of its sovereigns. We, therefore, suppose that the two unknown names are *Ptolemy* and *Cleopatra*; with this supposition we begin. If the supposition is correct, it is evident that there must be two *pees*, and two *els*, and two *tees*, all placed in certain positions. If we find these duplicates of letters where they ought to be, then we have got all the letters in the two words to begin with our new alphabet; and having got a beginning, we proceed, by the same process of *supposition, imagination, or theory*, to other equally certain conclusions. By this simple process, pursued with the most unwearied perseverance, old and lost alphabets have been restored, and rude monumental blocks, which our forefathers regarded as of less value than their weight in freestone or brick, become now very precious materials, for investigating historical facts, of the most universal and important interest.

But, independent of the mere phonetic character of the monumental tables—i. e. their sound or pronunciation, there is an interest derived from the symbolical and pictorial figures, which is peculiarly exciting at present. Rosellini, the companion of Champollion, is now publishing, under the patronage of the Grand Duke of Tuscany, a series of drawings, copied from Egyptian ruins, and representing, in language intelligible to all who are blessed with vision, a minute general outline, not only of civilization in Egypt, but of its national history. Domestic furniture, tools, utensils—habits, customs, and ceremonies, are most distinctly revealed;—chariots, equipages—religious rites and ceremonies—armour, sieges, battles, costumes—even earthenware, plate, and carving knives, with the maker's name on them, are carefully delineated. The most minute representation of the state of civilization is afforded by this extraordinary work. Every trade is brought forward by a pictorial image, which gives you, however rude the drawing may be, an idea of the state of advancement, to which the arts had arrived at that early period. The instruments, and art of agriculture, of weaving, of glass-blowing, leather-tanning, upholstery, turning, &c., in those patriarchal times, are all before your eyes, without any mystery of language or beau ideal of pictorial fancy. The drawings are ridiculously simple, and this simplicity really adds to their value, inasmuch as it creates confidence in their general accuracy, which we could not experience in respect to pictures, which were loaded with the creations of an artist's fancy. Even the very mountebanks, tumblers, and ball-catchers, so common amongst ourselves, and so frequently exhibited at our minor theatres, are there represented with the strictest accuracy, so that a child would recognise them as drawings from life. Yet many of these things must be, at least, 3000 years old; the productions of times which are only known to us through the medium of the Jewish historians. But Rosellini has already brought forward numerous facts to prove the truth of the Jewish history. An account of one of these confirmations, we shall quote from the *British and Foreign Review*—Jan. 1836.

"That the Jews were slaves in Egypt is an historical datum of the Bible, supported by classical authority. The most recent of Rosellini's illustrations prove it by ocular evidences to be the fact. The monumental figures depict them as making war with the Egyptians, and in one case (Belzoni's tomb) a Jew is portrayed as representing the Asiatic family of the female race, certainly not, as Dr. Young has imagined, as a slave in the train of Pharaoh Necho, who lived many centuries after the now proved tenant of Belzoni's tomb. But Rosellini's last illustrations depict Jews as the slaves of the Egyptians. He brings before us groups of individuals, upon whom no one that glances can avoid saying, 'Those are Jews.' They are represented under the eye of an Egyptian task-

master, who is seated with a goad in his hand, superintending their toils. The same taskmaster, with the same emblem of slavery, is again represented, in other places, controlling the labours of other slaves, who are working, like the negroes of the present day, in gangs, in the task of cultivation.

"But the Jews are not only represented by Rosellini as slaves, and that on the contemporary monuments of the kings who enslaved them, but they are exhibited performing the very acts, and employed in the very occupations, described by the Hebrew historian. They are gathering straw; they are making bricks, and conveying them, when made, to the buildings of the city where they are to be used. The shape of these bricks is extraordinary. They are the identical bricks, resembling the Roman, which are found at the present day as constituents in ancient Egyptian walls."

These are facts, if a piece of solid stone is a fact.

FUTURE RELIGION OF THE HINDUS.

It must be gratifying to the Universalist, to find that a periodical of the far East, has been putting forth observations, on the above subject, in perfect consonance with the principles of progress advocated by the *Shepherd*. The following is extracted from the *Bengal Herald* of a recent date, as quoted by the *Asiatic Journal* of last month:—

"The present Hindoo society, may be classified in the following order; viz. First, those who are sincerely the followers of idolatry, which class comprises the mass of the people. Secondly, those who have discovered its follies and absurdities, but have not courage to declare their heretical opinions in the assemblies of the orthodox, a class which comprehends many among the middling and higher ranks. Thirdly, those who have discovered the follies and absurdities of idolatry, and adopting the Vedant shastra, freely declare their opinion, but in practice conform to the established custom, and allow idols to be worshipped in their families. Fourthly, those who have entirely abandoned idols and superstition, but in consequence of parental control and family influence, cannot declare their sentiments, nor act according to their belief: this class comprises most of the rising generation, who are now being educated in our public schools. Fifthly, those who have entirely separated themselves from the Hindu Society, and embraced the Christian faith; of these there are but few, particularly among those of any influence or consideration. Sixthly, and lastly, those who have abandoned all religion, and are followers of reason; these generally believe in the existence of one God, but disbelieving all revelation, follow a code of morality formed by themselves. The individuals of this class have no fixed rule of action, are naturally divided in opinion among themselves, and are not known as a distinct body or sect. A survey of these classes shows that idolatry is on the wane; and that, as the light of knowledge spreads, the gloom of superstition is vanishing. It shows that some great and general change of opinion must soon take place. At present there are three systems of religion which appear to offer themselves to the attention of the regenerated Hindu,—Deism, Christianity, and reformed Hinduism. We do not think the first of these will be the future religion of the Hindus, simply, because experience teaches us that the bulk of the people, who seldom think on these matters, follow some fixed system of religion; and prefer to take a creed, prepared by others, for granted, rather than be at the trouble of forming a moral code for themselves. Christianity is also, in our opinion, not likely to become the national religion of the Hindus. The religion which is now followed by the mass of the Hindus, is pretended to be based on grounds similar to those on which Christianity rests her claim, namely, revelation supported by miracles, the accounts of which are handed down in books, and by oral tradition. Under these circumstances, we do not think it likely that those who reject the present popular Hinduism, notwithstanding its claims to revelation and miracles, will embrace another system, which bases itself on a similar foundation, and is, in many of its essential principles, similar to Hinduism. We, therefore, come to the conclusion, that in all probability a re-

formed system of pure Hinduism, or Vedantism, with some alterations, will be the future religion of the people who now adopt the idolatrous Hinduism."

These observations appear to us, in every respect, philosophically true; and may, moreover, be applied with equal justice, to the question, what will be the future religion of the Christian world? To illustrate this, do we not see that in England, society may be divided, in a similar manner to that in which the writer, we have quoted, has classed the Hindus? First, we have the sincere believers in old Christianity as taught by the parsons, whether orthodox or dissenting; and this class comprehends the greater part of the population. Secondly, we have the doubters; a large class, who, however, do not care to express their heretical opinions freely. Thirdly, comes the downright disbeliever, who, although he has shaken off all religious forms himself, and never goes to church, duly sends "his wife and family," for the sake of decorum and appearances. Fourthly, the rising generation of enquiring minds, who have risen above the fogs of bigotry and superstition, but are obliged to disguise their principles, for the sake of family peace, or worldly advantages. Fifthly, those who have openly declared their opposition to the fire and brimstone doctrines of old Christianity; but these are yet very few. Lastly, the open infidel and atheistical class, who are still fewer in number than the former; and with the same characteristic peculiarities as their brethren in India, naturally divided in opinion among themselves, and not known as a distinct body, or sect.

Union and organization belong only to the faith party.—L.

EDUCATION IN SCOTLAND.

THE average of the whole Returns gives 9½ per cent. of the population attending school. In this County (Lanarkshire) it sinks nearly one per cent. below this average. The population of Lanarkshire is 316,959, of which 27,784 are given as attending school, which is at the rate of only 8½ per cent. But when the returns are classified, the results at once assume an aspect of greater importance. Thus, taking the City of Glasgow alone, we have a population of 202,426, and 15,696 attending schools. This gives a per centage so low as 7½; or, in other words, it appears from the returns that only 1 in 13 of the population is attending school. This proves the state of education to be very low indeed; but, low as it is, it is from two causes especially, manifestly exaggerated. For, first, the returns were given in 1834, and the estimated population is that of 1831. The increase during the three intervening years would, on the most moderate estimate, be upwards of 20,000. This increase in the population, of course, diminishes, to a very considerable extent, the ratio of those attending school. But, second, there is a source of error which greatly exaggerates the number attending school. In the greater number of the parishes, the returns are made up from the number of children attending each school. Now, in the western part of the town especially, there is a division of labour among the teachers; one teaching writing only, another arithmetic only, another English only. The same children will, therefore, be found attending two or three teachers, and would be counted twice over. This clumsy mode of calculation, in short, will give rise to the same exaggeration, as if, in estimating the number of students attending our University, we were to count it from the class rolls of the individual Professors.

When we leave Glasgow, and look to the returns of the rural districts, we find a manifest improvement, though by no means so extensive as we could desire. Classing all those parishes together, whose population exceeds 2000, we find that there are in these a population of 99,109, of which 10,259 are attending school. This gives a per centage of 10½, or somewhat more than 1 in 9½ of the population. As we descend to the less populous parishes, the proportion gradually increases. There are four parishes with a population of between 1000 and 2000. They contain 6675 inhabitants, of whom 741 are at school. This gives somewhat more than 11 in the 100, or 1 in 9 attending school. The remaining parishes, fourteen in number, have a population of less than a thousand each. In some of these the

education seems in a much better state than in others; but taking the whole together we have the following result:—Population, 8,749; at school, 1,088. This gives a per centage of 12½; or, by another estimate, 1 out of every 8 persons attending school.

It is instructive to place these results alongside of each other.

| | Proportion attending School. |
|---|------------------------------|
| Glasgow | 7½ in 100, or 1 in 13 |
| Parishes whose population varies from 10,000 to 2,000 | 10½ in 100, or 1 in 9½ |
| Parishes whose population varies from 2,000 to 1000 | 11 in 100, or 1 in 9 |
| Parishes whose population is under 1000 | 12½ in 100, or 1 in 8 |
| | <i>Scottish Guardian.</i> |

NEW SPECIES OF SERPENT.—A late number of the Indian Medical Journal contains an account submitted to the Calcutta Medical Society, of a previously undescribed species of venomous serpent, belonging to the genus *Naja*, with some drawings of the reptile. The natives state that individuals are found upwards of twelve feet long; a size extraordinary for a venomous serpent. It is caught in the Sunderbunds and in the neighbourhood of Calcutta. This serpent usually feeds upon others, and those in Dr. Caunter's possession were regularly fed by giving them living snakes once a fortnight, without regard to their being venomous or otherwise. Dr. C. remarked upon the error of those naturalists who say that serpents never drink; these animals drink, and moisten their tongues, which with the Ophidians, whose tongues are not situated in the cavity of the mouth, become two different acts. This snake differs from the other varieties of venomous serpents in feeding, willingly, when in confinement, though no other Ophidian of its class is known to do so.

AN INGENIOUS MODE OF MAKING PAPER CASTS OF SCULPTURE.—“My servants made me casts in paper of the sculpture on the walls of these two rooms, that is, of all the sculpture in the three large plates, which I now publish. This method of obtaining fac-similes of sculpture in basso-relievo, is very successful, and so easy that I had no difficulty in teaching it to my Arabs. I found stiff, unsized, common white paper to be best adapted for the purpose. It should be well damped; and, when applied to sculpture, still retaining its colour, not to injure the latter, care should be taken that the side of the paper placed on the figures be dry—that it be not the side which has been sponged. The paper, when applied to the sculpture should be evenly patted with a napkin folded rather stiffly; and, if any part of the figures or hieroglyphics be in intaglio or elaborately worked, it is better to press the paper over that part with the fingers. Five minutes is quite sufficient time to make a cast of this description: when taken off the wall, it should be laid on the ground or sand, to dry. I possess many hundred casts, which my Arabs made for me at Thebes and in the Oasis. Indeed, I very rarely made any drawing of sculpture, without having a cast of the same: and as the latter are now quite as fresh as on the day they were taken, the engraver having not only my drawing, but also these indubitable fac-similes, is enabled to make my plates exactly like, and quite equal to the original.—*Hoskins's Visit to the Oasis.*”

JESUITICAL VIGILANCE.—The Duke de Choiseul, the French minister, was a principal agent in procuring the final suppression of the Jesuits, and the following origin has been assigned to the hostility with which he pursued the whole order in every quarter of Europe:—The Duke, having no employment in the Government of France, happened, one evening at supper, to say something very strong against the Jesuits. Some years afterwards, he was sent ambassador to Rome, where, in the usual routine of his visits in that situation, he called upon the General of the Jesuits, for whose order he professed the highest veneration. “Your excellence did not always, I fear, think so well of us,” replied the General. The Duke, much surprised

at this observation, begged to know what reasons he had for thinking so, as he was not conscious that he had ever mentioned the order but in terms of the highest respect. The General, to convince him of the contrary, showed him an extract from a large register book belonging to the Society, in which the particular conversation alluded to, and the day and the year on which it happened, were minutely down. The Ambassador blushed, and excused himself as well as he could, and soon went away, resolving within himself, whenever he should become prime minister, to destroy a society that kept up such particular and detailed correspondences, of which it might make use to the detriment of administration and government.—*Seward's Biographiana.*

CEMENT.—The following receipt for a cement is given in one of the scientific Journals of France. Steep an ounce of isinglass for twenty-four hours in half a pint of spirits of wine, then dissolve it over a slow fire, keeping it covered, that it may not evaporate; then take six cloves of garlick, previously pounded in a mortar, and squeeze the juice through linen into the isinglass; cork the whole together for a short time, and the mixture will cement either glass or crystal.

HEAT OF THE EARTH.—M. Arago has recently measured the temperature of an Artesian well, bored at the slaughter-house of Grenelle. A thermometer, of a new and more certain construction, was placed in it for thirty-six hours, and the temperature was found to increase, at the rate of one degree of the centigrade thermometer, for every thirty-one metres.

PRINTING FOR THE BLIND.—The blind are now taught to read by the touch, from raised type, and the fluency with which they pick up the words by the points of their fingers, is a miracle to us, who are provided with more convenient organs. This mode of printing has been brought to such perfection, that a recommendation has already been sent from Glasgow, to the British and Foreign Bible Society, to have the whole Bible printed in this style, and it is expected to meet with a favourable reception. There are supposed to be about 12,000 blind in the kingdom, amongst whom these Bibles may be sold or distributed. Mr. Alston, of Glasgow, has been devoting much zeal and patience to the improvement of this species of printing, which can now be executed, in small character, and so slightly raised, as not to prevent the sheets from being bound up in an ordinary sized volume.

TO CORRESPONDENTS.

We are very sorry to exclude our Transcendentalist's letter this week, but our reason for so doing is this:—we go much earlier to press than formerly. We have the whole number set up and imposed on Saturday afternoon. It is sent home to us for correction on Saturday evening. We make the final corrections on Monday, go to press on Tuesday, and it is all ready for distribution on Wednesday, when a copy may be obtained by any of our correspondents by applying to the publisher. We cannot, therefore, without deranging our plans, insert an article which comes later than Friday evening, in the week previous to publication. As for Hermes, we must give him a private drilling, for his article cannot be published this week, on account of a lapsus, which we cannot remedy.

LONDON: Printed and Published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 14, Snow-hill, Birmingham, and Heywood, Oldham-street, Manchester; Baker, St. Nicholas-street, Worcester; France, 87, Side, Newcastle-upon-Tyne; Smith, Tradesman's Mart, Nottingham; Tinker, Huddersfield; Chappell, Southey's-buildings, Bristol; Richea, St. George's Bridge-street, Norwich; Pring, 7, Turner's-buildings, Exeter; Marmont, Nelson-street, Stroudwater; Cousins, Half-moon-court, Tiverton; Bird, Cox-lane, Ipswich; Blackshaw, Edward-street, Stockport.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Pantheism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 3, Vol. III.]

SATURDAY, JULY 15, 1837.

[PRICE 1½d.]

OWENITES, PROTESTANTS, AND JESUITS.

Then pause and be enlighten'd; there is more
In such a survey than the sating gaze
Of wonder pleased; or awe which would adore
The worship of the place, or the mere praise
Of art and its great masters, who could raise
What former time, nor thought, nor skill could plan;
The fountain of sublimity displays
Its depth, and thence may draw the mind of man
It's golden sands, and learn what great conceptions can.
Childe Harold, c. 4, s. 159.

WHAT is the reason we have substituted Jesuits for Catholics? Because they are better Catholics than the Catholics.

It was a shrewd observation of St. Simon, in his "Nouveau Christianisme," that the spirit of old Catholicism was destroyed by the Reformation and the Council of Trent. The life of a system is progression. The very first act of the Council of Trent was to do what had never been done before, viz. to "frame a confession of faith, wherein should be contained all the articles which the Church required its members to believe." The reluctance of the Pope to call and authorise this Council was excessive. It was literally forced upon him. But even his own sham Catholics had the Protestant spirit. This spirit destroyed the old Church, and the Council of Trent was merely the sealing of the decree which had long before gone forth.

But the Jesuits appeared at the very nick of time, to raise up a new from the ashes of the old system. The order was instituted, and duly authorized, after several refusals by his Holiness, in 1540. The Council of Trent met in 1542, the year in which Xavier, the first Jesuit missionary, arrived at Goa, in India, and began to Christianize the natives by thousands. The order grew like a vine, with the strength of an oak. It began with ten members, and before the end of the century it had increased to ten thousand, and obtained the chief direction of the education of youth in every Catholic country in Europe, with the confessorships of all the principal monarchs.

It is the new phoenix that sprung from the corpse of the old, with increased vigour, and elasticity of mind and body, and its health and its power, like all other health and power, lie in its organization with religious zeal as a principle of life.

Now what has this Society done, with all its abominable doctrines, its tyrannical plots, and crusades against popular liberty?

In the first place, the Society has an excellent moral character from all parties. Dr. Robertson, a Scotch Tory clergyman, belonging to a school which is inveterate in its opposition to the order, says, "As I have pointed out the dangerous tendency of the constitution and spirit of the order, with the freedom becoming an historian, the candour and impartiality, no less requisite in the character, call on me to add one observation, that no class of regular clergy in the Roman Church has been more eminent for decency, and even purity of manners, than the major part of the order of the Jesuits." Bishop Fitzjames, in an appeal, in which he vehemently abuses them, makes the same

confession, which, when extorted from an enemy, comes with peculiar force.

The casuistry and sophistry for which the order is notorious are not to be justified; but the good morals of the order are sufficient to prove that it was not through moral wickedness that they erred, but rather through ignorance or doctrinal weakness, urged on by mental vigour and unwearied zeal. Their religious principles being defective, they found themselves paralyzed, and obliged to employ tactics to confront their adversaries. These tactics were very loose and immoral, but the opposition of their adversaries was by no means more conducive to virtue. We must judge them by comparison.

We shall see what some of these wicked men did, when they had it in their power to do. Amid the fixed stars of European sovereignty it was not to be expected that they could do much; they could not alter the forms of government; they were, therefore, necessitated to conform to those which were established. But when they had it in their power to change and reconstitute, the history of Paraguay will show what they would have done, even with Europe, if they could.

About the beginning of the seventeenth century, they obtained from the court of Madrid the grant of the large and fertile province of Paraguay, which stretches across the southern continent of America, from the mountains of Potosi to the banks of the river La Plata; and after every deduction which can reasonably be made from their own accounts of their establishment, enough will remain to excite the astonishment and applause of mankind. They found the inhabitants in the first stage of society, ignorant of the arts of life, and unacquainted with the first principles of subordination. They applied themselves to instruct and civilize these savage tribes. They commenced their labours by collecting about fifty families of wandering Indians, whom they converted, and settled in a small township. They taught them to build houses, to cultivate the ground, and to rear tame animals; trained them to arts and manufactures, and brought them to relish the blessings of security and order. By a wise and humane policy, they gradually attracted new subjects and converts, till at last they formed a powerful and well-organized state of three hundred thousand families. Over these they exercised a mild and patriarchal government, and their subjects, docile and grateful, revered their benefactors as divinities. The country was divided into forty-seven districts, over each of which a Jesuit presided. A few magistrates, chosen by the Indians themselves, assisted in every town, to secure obedience to the laws. In other respects, all the members of the community were as one family, on a footing of perfect equality, and possessed all things in common. Every individual was obliged to labour for the public, and the fruits of their industry were deposited in common storehouses, from which every person received whatever was necessary for the supply of his wants. Punishments were rare, and always of the mildest description—such as an admonition from a Jesuit, a slight mark of disgrace, or, at most, a few lashes with a whip. Industry was universal, but wealth and want were equally unknown, and most of those passions, which disturb the peace of society, were deprived of every opportunity to operate. Even the elegant arts began by degrees to appear,

* Robertson's Charles V. book 7.

and full protection was provided against every invader. An army of sixty thousand men were completely armed, and regularly disciplined, consisting of cavalry, infantry, artillery, and well provided with magazines of all the implements of war. The Indians of Paraguay, in short, under the government of the Jesuits, were an innocent and happy people, *civilized without being corrupted*, and yielding with entire contentment the most perfect submission to an absolute but equitable government. Yet [here appear the defects of the elementary principles, which were not sufficiently universal to admit of free scope] even in this meritorious effort for the welfare of mankind, the peculiar spirit of the order was sufficiently discernible. In order to preserve their influence, they found it necessary to keep their subjects in a state of comparative ignorance; and, besides prohibiting all intercourse with the adjacent settlements of the Spaniards and Portuguese, they endeavoured to inspire them with a hatred and contempt of those nations.*

We extracted the above from the Edinburgh, or Brewster's Encyclopedia, and in looking into Robertson's Charles V. for another respectable authority, we find that the Encyclopedia has borrowed Dr. R.'s language, almost verbatim. The Doctor, however, is a host in himself; but to satisfy the predilection for authority, which exists even in the most voluntary Radical, we shall give one or two more of an equally respectable rank:—

"Who is so ignorant," says the author of "*Nouvelles Considerations*," a work published about twenty years ago at Versailles, in defence of the Jesuits, "of the history of America, as not to have heard of that magnificent mission of Paraguay, where the cross became the standard, and the gospel the code of law, to three hundred thousand Indians, who lived for a whole century in a perfect Christian community, in which brotherhood and friendship produced nothing but the purest virtue, a happy simplicity of manners, and the admirable fruits of the most sublime Christianity. Muratori, by a masterly touch of his pencil, has displayed in the liveliest colours the happy effects of Christianity upon these hordes of savages, by the two significant words—*Il Christianismo felice*."

"Paraguay," says Montesquieu, "furnishes us with a specimen of those admirable institutions, established for the purpose of training people to virtue. Attempts have been made to make a crime of it, in the fathers of the Society. It is glorious for them to have been the first to have given practical demonstration, in those countries, how to couple religion with humanity. In repairing the outrages of the Spaniards, they began to heal one of the most deadly wounds ever inflicted on the race of man. A high and lively sense of what is called honourable and real zeal for religion, made them undertake these things, and success attended their efforts."

"The Missions," says Buffon, "have gained more subjects amongst the barbarian nations, than the conquering armies of the nations which subjugated them. Paraguay was conquered only in this manner:—The mildness, the good example, the charity, and regular conduct of the missionaries, affected the savages, soothed their ferocity, and gained their confidence. Frequently did they come, of their own accord, to seek out the teachers of a law, which rendered men so perfect. They adopted the law, and joined in community. Nothing does more credit to religion than to have civilized whole nations, and to have laid the foundations of an empire, upon no other than the arms of virtue."

"The enemies of the Society," says Haller, a Protestant, in his treatise on several interesting subjects of politics and morals, "undervalue its very best institutions. They accuse them of boundless ambition, in seeing them forming a new species of

* We have no doubt that this severity on the part of the Jesuits was necessary to preserve their community. The corruption of morals that prevailed around them was too powerful for the resistance of a small society. It is only when such a social system has become almost universal, that what is generally called freedom can begin, just as free-trade cannot be established in one country without being established in all. So that it is evident, that, without a general congress of nations, none of those great social objects, for which philanthropists are striving, can be attained.

empire in these remote regions. But what is there in Nature more admirable, and more advantageous to the cause of humanity, than to bring together into community, hordes of our fellow-creatures, dispersed, in the state of uncivilized nature, throughout the wild forests of America, and to draw them out of the state of barbarism, which is of itself a state of wretchedness—to prevent and check their cruel and destructive internal dissensions—to enlighten them with the light of true religion—and to unite them in a society, representing the golden age, by the equality of its members, and the community of property?"

The testimony of the celebrated Lande, the astronomer, an avowed infidel, is very affecting. Speaking of the suppression of the order by the Catholic States, at the instigation of the Jansenists, the Philosophers, and the Protestants, he says, "Mankind has irretrievably lost, and never will recover, that precious and surprising union of 20,000 individuals, devoted incessantly and disinterestedly, to the functions of teaching, preaching, missions, conciliations, and succour to the dying, that is to say, to duties the most serviceable and dearest to humanity. Retirement, frugality, and the renunciation of pleasure,* constituted, in that society, the most harmonious concord of science and virtue. I had personal knowledge of them. They were an assemblage of heroes for religion and humanity. Religion afforded them means which philosophy cannot furnish. I was enraptured with them. When I was but fourteen years of age, I loved them to such a degree as to solicit to be admitted amongst them, and I regret, to this hour, that I did not persevere in this vocation, which originated from my state of innocence, and thirst after knowledge."

These Jesuits succeed in enchainng the affections wherever they go. They have the secret of training and governing mankind. William Howitt, a well-known Quaker Liberal, who has written a history of priestcraft, and abused the Jesuits in particular, is obliged to acknowledge their great superiority in the formation of character. "The place, (Stonyhurst, Jesuits' College, Lancashire) indeed, is a perfect rural paradise, and what has alarmed the Church of England no little, and caused it to build a new church at the nearest point of approach, and induced the neighbouring clergy to preach furious sermons against them, is the fact, that the fathers have proselyted the greater part of the population of the neighbourhood. Their regular congregation now consists of 1600 people, exclusive of their own establishment, which is 250, (chiefly pupils), making in all, about 1850 people.—(*Tait's Magazine*. No. 37.)

He thus describes the order and decorum observed in the education of children:—"An excellent and effective mode of education is adopted here. After philosophical exhibitions in these rooms, and after silent reading in the Hall of Study, each class returns to the room of its particular teacher, and every boy is carefully questioned upon what he has seen or read, so as to ascertain that he has clearly comprehended, and made himself master of the matter presented to his mind. The silence and decorum of the school are beautiful. At one moment, the sound of 166 boys, at play in front of the college, came up to us; the next, we saw them marching to the Hall of Study; and, shortly afterwards, passing the door, so profound was the hush, that we inquired whether it were not really empty."

After giving a very favourable account of this institution at Stonyhurst, Mr. Howitt puts in italics and capitals, the following question, exactly as we have printed it:—"Now, we ask, can any one show us a more signal example of THE TRIUMPH OF THE VOLUNTARY PRINCIPLE?" i. e. over the Established Church.—Voluntary principle! Can there be anything voluntary in such a despotic institution? Yes; what can be more voluntary than a resignation of the will to a judicious-living system of strict discipline? and what can be more involuntary? the perfection of the voluntary, is the involuntary, system. The perfection of a system, is the union of the two in such a manner that the one is lost in the other. What is now known by the

* That is, mere sensualism, or pleasure in its grossest acceptation. The pleasures of the Jesuits were the pleasures of other men of intellectual and literary character.

† *Annales Philosophiques*. Tom. i. (1800) p. 228.

name of the Voluntary system, that is, the fortuitous-concourse-of-atoms system, is a grinding despotism, under which every man is a victim and a tyrant in one, and where we cannot converse with a single member of society, who has not a system of his own, and with which he hates and sneers at all but himself, and is repaid with hatred and sneering in return.

There is no living principle at the head of an Establishment. It is a dead letter. The true Catholic system is not an Establishment. It ought to be a moveable system, and the Jesuits of Stonyhurst understand it as such. "We know," said the Jesuits of Stonyhurst, to Mr. Howitt, "that it (an Establishment) infuses a Lethæan lethargy—it destroys the vitality of zeal—it breaks up the *living interest* between the priest and the people;" and, if it be suspected that there is Jesuitical craft in this saying, we may remark, that a system which is organized upon the principle of *extreme democracy*, united to *extreme monarchy*, must be a moveable system, for the popular voice, in selecting its supreme heads by acclamation, will itself be the breeze that fills the sails of the social vessel. That which stagnates a system is the *dead letter* of creeds and statutes. We want the *living law*.

We have very little room left to compare the doings of these "hypocritical scoundrels," as the French philosophers used to style them, with what has been attempted, but never accomplished, by those who regard themselves as infinitely superior in all the essentials of a sound understanding and a virtuous principle. In fact, the comparison is useless. There is no other antithesis, except that of something being done on one side, and mere nothing on the other. Where do you imagine all this superiority on one side lies? In discipline. Hear Henry Martyn, a zealous, pious, enthusiastic, talented, Protestant, Missionary to the East:—"Certainly there is infinitely better discipline in the Roman Church than in ours, and if ever I were to be the pastor of native Christians, I should endeavour to govern with equal strictness." "But," say the modern rationalists, "we do not want to be governed at all; we want to be free, to govern ourselves!" Well, do govern yourselves; but while you govern yourselves without an authoritative head, instead of ruling the waves, like Britannia, you will merely be tossed about among the breakers, like an old raft. If you have no faith in God, you must have faith in a man. You have not confidence in one another. And if you have not all confidence in the same individual, your social movements must play a most fearful discord. We suspect that many of our Owenite friends will agree with us in this, that FAITH in some active being is necessary,—to constitute a practical system—and, if that faith be necessary, "all must be resigned into his hands." There's the rub! Have the Owenites got this faith? How can they get it? And can they do any thing without it? If you can get this faith in an individual by science, or infidelity, then we say they may succeed in familiarizing the human race. But, if they cannot supply this faith, and the zeal which grows out of it, then some other root must be sought, from which to draw forth the living principle of action; or we must be content to go deeper and deeper into confusion, each man playing his own game, and becoming his own master. If this be our destiny, it is the very opposite of Owenism.—(See "*The Liberals*," page 24.)

MISSIONARY SOCIETIES.

We have always looked upon Missionary Societies as powerful instruments in the hands of Providence, for spreading the seeds of progression and improvement throughout the world; and for bringing about an interchange of knowledge, and friendly intercourse between nations widely remote from each other, who, but for the zeal of religious proselytism might long have been strangers. The success of these institutions, however, as far as conversions go, is, in no way, commensurate with the astounding efforts they have made. Yet, as the sons of the old man in the fable, who carefully dug up their patrimonial land, in search of a supposed golden treasure which their father had hinted at on his death bed, though they found no treasure, so loosened and fructified the soil, that they were amply repaid for their labour in the abundant crops of grain, it was thereby

made to produce; so do the labours of the missionaries, till and prepare the moral wilds of the earth, which, at the appointed time, will doubtlessly bring forth good fruit in abundance.

As an example of the utility of these societies in impelling onwards the tide of progress to the shores of hitherto the most uncivilized and barbarous nations of the earth, we will here present our readers with some particulars, which we have gathered from "A Retrospect of the last Forty Years of the London Missionary Society," recently published by the directors of that body. We are there informed that, forty years ago, "our fathers, in faith and prayer," laid the foundation of the institution; and that no equal period of time has been marked by events more important to mankind. The preparations for the moral renovation of the world have advanced with unparalleled celerity, and have received "the most cheering tokens of Divine approbation."

In reference to the British and Foreign Bible Society, we are told that, in "all the majesty of Christian benevolence," it is going throughout the world, scattering in its course the incorruptible seeds of divine truth. It has already received for its support the sum of £2,240,000; and has distributed upwards of 8,000,000 copies of portions of the word of God. The Religious Tract Society, too, has attained an annual income of nearly £60,000; and has distributed, in 76 languages, nearly two hundred millions of its publications.

In allusion to the South Sea Islands, the directors rejoice that the Lord has at length smiled on Missionary efforts in that part of the world. Since 1811, idolatry has been subverted in those isles; infanticide and murder have ceased; and education has been promoted among the inhabitants. The people, "fast rising in the scale of nations, have as fruits of the divine blessing on Missionary perseverance, now a written language, a free press, a representative government, courts of justice, written laws, useful arts, and improved resources. An infant navy is rising on their shores; commercial enterprises are promoting industry and wealth, and a measure of domestic comfort, unknown to their ancestors, now pervades their dwellings."

In China the operations of the Mission are going on with increased force upon the immense population of that empire; and the Directors have in contemplation to establish a steam press as near China as possible, to print the Scriptures and other Christian books in the Chinese language. The press at Batavia turns off a million of pages annually, besides those printed at other stations; and at Malacca, although twelve men are constantly employed in printing, the demand still exceeds the supply. In India, the power which once prohibited, now protects the missionary; and the honourable policy at present pursued by the Government, leaves him, without interference or restraint, to pursue his holy calling. A mighty change in native sentiment and feeling, in regard to idolatry, has commenced; and the means for spreading the Gospel are multiplying on every side.

In Madagascar the society commenced its labours about seventeen years ago. Since that time, a language spoken by 4,000,000 of people, has been reduced to a regular system: orthographies and grammars have been formed, schools established, thousands taught to read, and education, long regarded with suspicion, is now in general esteem amongst the inhabitants. The press is here also in efficient operation; and 129,800 Christian books have been put into circulation.

In South Africa, thirty-four devoted brethren, and ten native assistants, now occupy the field: Christian education is extending—the press has commenced its light-diffusing labours—and these hitherto barbarous people, are reading in their own language the oracles of truth. The Gospel is preached, churches are gathered, and the moral desert is becoming as the garden of the Lord. Tribes have been rescued from extermination; their rights acknowledged and secured; the cheerful activity of thriving towns and villages appears, where, a short time since, the wilderness spread its lonely solitude; and the wanderers of the forest have become united and organized communities, standing in honourable alliance with the British Nation.

In the West Indies, where the African race has received such signal benefits, the extinction of slavery and the slave trade—the society has taken an humble share in leading the

natives to seek the more glorious liberty of the gospel of Christ. In this field, long one of painful interest, the Society has now twenty missionaries; and will be happy to augment the number to the extent required, should the Lord incline the hearts of his servants to enter upon the service."

The above details must be interesting and gratifying to all who entertain the slightest wish for the furtherance and progress of knowledge throughout the world. They are highly coloured, we believe, but still the fact of an increased intercommunication between the different tribes of men cannot be disputed, and this, alone, must lead to a happy result. We are only sorry to think, that what these pious missionaries call "the garden of the Lord," is nothing more than the British and Foreign *Christianity* at the best—a miserable, sickly, fallen, apostate, unsocial thing, which would be more correctly designated by the name of "the Garden of the Devil." But we must all *creep* before we *walk*.

L. S.

THE TRANSCENDENTALIST'S DIALOGUES.

No. II.

ON "THE ONE."—(Continued from p. 5.)

Transcendentalist and Materialist discovered sitting at a table, on which stand a jug of cyder and glasses—Materialist reading the last Shepherd's Notice to Correspondents.

Mat.—"The true arena for the science of mind is the Marylebone workhouse."—Ha! ha! ha! Why, what is Mr. Wigram doing?

Trans.—Imbuing a number of children with the principles of Kantian criticism.

Mat.—Aye, aye, I remember now. Let me see: Are you a Kantist?

Trans.—When talking to you I am; but among Kantists, I am no Kantist at all.

Mat.—However, you know something about the matter. Now, perhaps, you will tell me what great secret is possessed by the Kantists; they always seem proud, as if they possessed an inestimable treasure denied to the rest of mankind. What is this treasure?

Trans.—No treasure at all. The Kantists really possess no important secret, all that they have is a method.

Mat.—Oh, I see; they have not the treasure, but they know the way to get it. Well, that is no small matter.

Trans.—Aye, but they don't know, nor profess to know, any thing of the kind. They simply know the way which will *not* lead to the treasure, and hence they are very wrong in stopping at Kant. I believe I know as much of Kant's "Critique of pure Reason," as most of his disciples, and more of it than many of them; but, far from my studies in philosophy being ended, I feel the necessity of pushing them on more than ever. Kant shows you by what means a knowledge of the Absolute is *not* to be attained, so what course is left us, but to beat about till we have discovered the right road?

Mat.—Then the works of Kant are not much worth studying.

Trans.—Not worth studying! My dear fellow, they are master-pieces! By reading them (a matter of no such great difficulty, provided you are previously acquainted with the forms of logic), you will learn one important truth, namely, that the common logic is not suited to the investigation of supersensual things; a truth, the knowledge of which will prevent you from being misled by many fallacies. But, as I before said, the Kantists are wrong in stopping satisfied with this negative result, instead of inquiring further. In my dialogues with you, I usually lead you to negative results, but I should be grievously disappointed if we ended in a negative.

Mat.—Then whither do you propose to lead me?

Trans.—I don't know; I am not an adept initiating a pupil, I am but a fellow-traveller on the thorny path, which, I am happy to find, you have begun to tread, and as I am a little (only a little) in the advance of yourself, I am endeavouring to warn you against the brambles of prejudices, which may impede you on your way; hoping that we shall both end our journey by arriving at a snug resting-place. But—but—now for the "One" again. Where did we leave off?

Mat.—Um—there is our record (*taking up Shepherd*). We began by writing up, "X is a self-existing body, co-existing with other self-subsisting bodies, and occupying a portion of space." We then found that X, if it occupied a *portion* of space, must be enclosed, and hence that it could not exist without the enclosing bodies, and of course that it was not self-existing.

Trans.—Yes, that was one result. And, of course, we must conclude that no particles are self-existing, for the adjacent particles to X, are as much bounded by X as X is by them. Let us take an adjacent particle, and call it Y. Now, X is bounded by Y, and Y is bounded by X, and their very existence depends on their contingency.

Mat.—Stay, stay, the form of the particle does not depend on it being bounded by any particular particles, but it must be bounded by some. The existence of X does not depend on that of Y, in particular, as any other boundary might preserve its form.

Trans.—That is well observed; and, therefore, to prevent misunderstanding, I say that X and Y mean any adjacent particles. We have admitted that some adjacent particle or other is requisite to the existence of either; and hence, whatever particle bounds, and is bounded by X, I agree to call it Y.

Mat.—True, I see you mean your symbols to express no more than the mere general proposition: one particle must be bounded by another, to which I agree.

Trans.—Well, then, X cannot exist except in contact with Y, nor Y except in contact with X.

Mat.—I see, the existence of each depends on their mutual contact.

Trans.—And we cannot express mutual contact better than by the symbol $X + Y$.*

Mat.—Very good. $X + Y$ expresses the contact.

Trans.—Well, then, as the existence of X and Y depends on their being in contact; the existence of X and Y depends on that of $X + Y$. In other words, the compound appears the cause of the things of which it is compounded.

Mat.—Oh! how I am mystified! And I thought we were going on so smoothly. That $X \pm Y$ should be prior both to X and Y. What infernal absurdity! and yet I do not see how we are to avoid it. Stop, stop! X and Y cannot be in contact without they exist, that is self-evident; neither can they exist without being in contact, as appears by what I have already said. Therefore, the existence and the contact mutually depend on each other, and neither is prior to the other. Thus, I think we have steered clear of the shocking absurdity.

Trans.—Yes, we are now proceeding well enough. X, Y, and $X + Y$, are mutually the causes of each other. Now, in what do the expressions X, Y, and $X + Y$, differ?

Mat.—The latter has the sign *plus* (+); the former has not. And, hence, in the former expression, we merely consider of X and Y, without once reflecting whether they are in contact or not; whereas, the second expresses that X and Y are in contact.

Trans.—Then the contact of X and Y, is merely expressed by the sign +?

Mat.—Yes.

Trans.—Very well.—Now, I think we have proved, that X and Y, when parted, fall away entirely, become nothing. Hence, we must not look at either of these for the "One," or we shall get "nothing" for our pains. And, if we look at the combination of X and Y, we find that which we agreed to call the "One of composition, or aggregation," in our last dialogue, by which, if you remember, we meant a multitude of particles, which became a sort of *One* by their union. This, we settled, was not a pure *One*; being, at the same time, *many* and *one*. (v. p. 4).

* In the first volume of the *Shepherd*, some one objected to the use of algebraical signs, as unintelligible to unlearned readers. To avoid this objection, I beg to state, that + is the sign of addition. Thus: 5 + 3, means that five is *added* to three; and, of course, the result is eight. $X + Y$ would be a collection of particles, resulting from the addition of Y to X.

Mat.—Then it appears we must give up looking for the *pure one* altogether, for if we examine a single particle it turns out to be nothing; if we examine an aggregation, we find a *many*, as it were glued into a sort of *one*, which is by no means a *pure one*.

Trans.—Stay, stay, we won't give up our investigation too soon. I think we have discovered that it is useless to seek for the one among ultimate particles, but, at any rate, the "one of aggregation" has some *oneness*, though it is not a *pure one*, so let us examine that.

Mat.—Good, and we need not beat about unknown regions for the "one of aggregation," as we did for the ultimate particles, which we were obliged to call X and Y. The "one of aggregation" may be seen with our own eyes, so we will return to the examination of our old piece of wood (v. 1st. dial:) which is a "one of aggregation."

Trans.—Yes. It is a *many*, with respect to the number of pieces, into which it may be divided, and a *one*, if we regard their union. Let us call these pieces X, Y, Z, the whole piece of wood will be X + Y + Z, the contact being expressed by +. Hence its being a *many* proceeds from the X, Y, Z, the oneness consists in the +. We have now materials for reflection sufficient to employ us for a week. We have discovered that the best method to discover "The one" lies not in investigating the things united, but that which, as it were, binds them together. Indeed the result of our investigations reminds me of what I once heard my worthy friend Mr. J. Greaves say, that there is "more value in that which connects, than in those that are connected." However our inquiries are not over, at our next meeting we will examine + and its meaning; and see if we can therein discover the "One."

THE TRANSCENDENTALIST.

SOMETHING VERY AWFUL!

THE following specimen of morbid and hideous piety we have extracted from the Evangelical Magazine—a sort of Jewish periodical, which professes Christianity, but seems to rely, almost exclusively, for salvation, upon ceremonial forms and observances, which are of little real value. It is contained in an article on the state of our village population, by what is called an "Assistant," a species of Dissenting clergyman, an instructor of the people, in things which pertain unto their everlasting peace!—

"The extent to which sin prevails in some of those places where the gospel is occasionally proclaimed, is truly awful."

This is the commencement. The reader, therefore, will do well to pause and strengthen his nerves, for the fearful revelation which is to follow. A lady may take half a glass of brandy for a stomacher, and a gentleman a tumbler of good brown stout, or country ale, to blunt his perceptions, before this truly awful condition of the village morality is made known to them. Could they ever imagine, that in a place where "the gospel of glad tidings to the poor" is *occasionally preached*, that the children would be so wicked as to dance and skip, and amuse themselves on a Sunday? that, forgetting "the Lord that bought them," they would *join hands*, and arrange themselves in a circle, on God's holy day, and *utter sounds* fearful to be heard at any time by an assistant preacher? But such is really the case. Witness the following testimony by an Assistant:

"On returning last Sabbath from a village, where I had been breaking the bread of life, I was compelled to witness what could hardly fail to excite grief in any Christian mind. At not more than about fifty yards from the house of God, ten or twelve boys were collected together, playing at cricket. A little further, in the centre of the village, about the same number of girls were assembled, to throw and catch a ball. These I attempted to divert from their play (he had not courage to attack the boys), but in vain. They looked, *they laughed*, they refused to retire (truly awful); with fresh energy they pursued their game (opposition produced a new stimulus, no doubt). Passing through the next village, in my way homeward, I saw two other groups similarly engaged. The last of these, com-

posed of, perhaps, twenty boys, between the ages of ten and eighteen, occupied the most public station that could be found in the place; and as they uttered sounds dismal to be heard at any time, and especially so on the Sabbath day, they joined their hands, and arranged themselves in a circle, almost as if they intended to give the dreadful intimation that they would unite to commit their evil, and that their purpose of misery should have no end. What must be the condition of villages in which these things exist? What *sense* of religion can be entertained by the parents of children who are allowed thus to occupy the hours of the Sabbath day? These scenes certainly indicate that parents and children are alike devoted to *sin*—that the next generation is preparing to exceed the present in the commission of *evil*."

This passage is worthy of a Jew of the age of Nehemiah. The self-righteousness, the *nomianism* it displays, is the very reverse of Christianity. Did ever Jesus Christ talk so? Did his Apostles talk so? Is there a single sentence in the New Testament written in this spirit? On the contrary, the great Apostle of the Gentiles, who is generally allowed to be the best expounder of the Christian doctrine, positively rebukes his disciples for giving preferences to days. He regarded the Sabbatarian prejudice as a relic of Judaism, and a clear proof that the person who entertained it knew nothing at all of the spirit of Christianity. The person who writes the above narrative is a Jew at heart. His Christianity is a mere assumption. He has not the slightest warrant for it, except from the example of Nehemiah, the Jew, whose pharisaical self-righteousness very few, even of our most orthodox divines, are able or willing to defend. Such Christians as this seem to think that because they do not kill sheep and oxen, as sacrifices to God, that they are not Jews! and because they do not *call themselves* Pharisees, that they are not Pharisees! It is a gross delusion. They are both Jews and Pharisees, trusting in the letter of the law, and trying to gain salvation by its puerile observances. But the greatest of all the Apostles has declared that by the works of the law shall no flesh living be justified; and that this particular virtue of Sabbath-keeping, as defined by the "Assistant," is of this description, is evident from the fact, that neither Jesus Christ, nor his Apostles, have even once enjoined its performance, but on the contrary, have very plainly and forcibly rebuked the mock piety of those who confound formal Sabbath observances with the interior spirit of genuine religion. There was more real Christianity in the girls who laughed, than in the Assistant who rebuked them. His self-righteousness, however, won't acknowledge this. But let him bring the Scriptures forward in his defence, if he can. We challenge him to bring even one passage. "Ye regard days, and months, and years," says St. Paul to the Galatians, "I am afraid of you, lest I have bestowed upon you labour in vain."

EASTERN PATRIARCHAL GOVERNMENT.

(Continued from No. 2).

CHINA.—The Emperor's titles are the "Son of Heaven," "the Ten Thousand Years." He is worshipped with divine honours, and with the faculty of ubiquity throughout the Empire. * * *

"The Emperor worships Heaven, and the people worship the Emperor. It is remarkable, that with all this, the Sovereign, in styling himself, uses occasionally such a term of affected humility, as "the imperfect man," which presents a contrast to the inflated and self-laudatory expressions of most oriental monarchs. Every device of state, however, is used to keep up, by habit, the impressions of awe. No person whatever, can pass before the outer gate of the palace, in any vehicle or on horse-back. The vacant throne, or a screen of yellow silk, are equally worshipped with his actual presence. An imperial dispatch is received in the province, with offerings of incense and prostration, looking towards Peking. There is a paved walk to the principal audience-hall, which none can tread but the Emperor. At the same time, as if his transcendent majesty, could derive no increase from personal decorations, he is distinguished from his court, unlike most Asiatic Sovereigns, by being more plainly clad than those, by whom he is surrounded. In Lord Macartney's mission, while the crowd of

Mandarins was covered with embroidery and splendour, the Emperor appeared in a dress of plain brown silk, and a black velvet cap with a single pearl in front. Yellow as the imperial colour would seem, at present, rather to distinguish things, pertaining to his use, or connected with him in other ways, than to constitute a part of his actual garments. The sovereign of China has the absolute disposal of the succession,* and if he pleases, can name the heir out of his own family. This has descended from time immemorial; and the ancient monarchs, Yaou and Shun, are famous examples of such a mode of selection.

As Pontifex Maximus, or High-Priest of the Empire, the "Son of Heaven" alone, with his immediate representatives, sacrifices in the Government temples, with victims and incense. These rites, preceded as they are by fasting and purification, bear a perfect resemblance to the offerings with which we are familiar, in the history of antiquity. No hierarchy is maintained at the public expense, nor any priesthood attached to the Confucian or government religion, as the Sovereign and his great Lords perform that part.

The Sovereign is High Priest, and the ministers are members of the hierarchy.

The total number of civil magistrates throughout China is estimated at 14,000.

A red book (being literally one with a red cover) in six small volumes, is printed quarterly by authority, containing the name, birth-place, and other particulars, relating to every official person in the Empire. No individual can hold a magistracy in his own province; and each public officer is changed periodically, to prevent growing connections and liaisons with those under his government. A son, a brother, or any other near relation cannot hold office under a corresponding relative. Once in three years, the viceroy of each province, forwards to the board of civil appointments, the name of every officer under his government, down to a *Hein's* deputy, with remarks on their conduct and character, which have all been received from the immediate superiors of each, a plan not unlike that which has lately been adopted in the civil government of British India. According to the report, every officer is raised or degraded so many degrees. Each magistrate is obliged to state in the catalogue of his titles, the number of steps he has been either raised or degraded.

"It may be considered one proof of social advancement, on the part of the Chinese, that the civil authority is generally superior to the military, and that letters always rank above arms, in spite even of the manner in which the Tartars obtained the empire. In this respect China may be said to have subdued her conquerors.

"It is the business of the first four books of Confucius to inculcate, that from the knowledge and government of *one's self*, must proceed the proper economy and government of a family; from the government of a family, that of a province and a kingdom. The emperor is called the father of the empire. The viceroy of the province over which he presides; and the mandarin of the city which he governs; and the father of every family is the absolute and responsible ruler of his own household. Social peace and order being deemed the one thing needful, this object is very steadily and consistently pursued. The system derives some of its efficacy from the habitual and universal inculcation of obedience and deference, in unbroken series, from one end of society to the other; beginning in the relation of children to their parents—continuing through that of the young to the aged—of the uneducated to the educated—and terminating in that of the people to their rulers."

The emperor, no doubt, considers himself responsible to God only; but it must be some consolation to think, that even this responsibility is acknowledged. Our royal Britannic Sovereign never appears in public as a responsible personage, either in re-

spect to God or man. The following is a prayer of the Emperor of China, on the occasion of a severe drought, in 1832. It will be long, we fear, before our infallible monarch be permitted, by Christian etiquette, to make his appearance in public, in such a humble and fallible character:—

"I, the minister of heaven, am placed over mankind, and made responsible for keeping the world in order, and tranquillizing the people. Unable, as I am, to sleep and eat with composure, scorched with grief, and trembling with anxiety, still no genial and copious showers have yet descended. * * * I ask myself, whether, in sacrificial services I have been remiss—whether pride and prodigality have had a place in my heart, spreading up there unobserved—whether, from length of time, I have become careless in the affairs of government—whether I have uttered irreverent words, and deserved reprehension—whether perfect equity has been attained in conferring rewards and inflicting punishments—whether, in raising mausoleums, and laying out gardens, I have distressed the people, and wasted property—whether, in the appointment of officers, I have failed to obtain fit persons, and thereby rendered government vexatious to the people—whether the oppressed have found no means of appeal—whether the largesses conferred on the afflicted Southern provinces were properly applied, or the people left to die in the ditches. * * * Prostrate, I beg imperial heaven to pardon my ignorance and dullness, and to grant me self-renovation, for myriads of innocent people are involved by me, a single man. My sins are so numerous, that it is hopeless to escape their consequences. Summer is past, and autumn arrived, to wait longer is impossible. Prostrate, I implore imperial heaven to grant a gracious deliverance, &c."

This is somewhat more pleasing to read than a king's speech. It is curious, that the absolute monarch should be regarded as *fallible*, and the limited monarch as *infallible*. Were the absolute monarch, however, chosen by the people, and influenced by public opinion, he would be *really infallible*, inasmuch as the responsibility of his measures must rest upon the nation at large, which is responsible to God only.

A CONVERT!

[THE following is a specimen of a South African convert to Christianity, now become a preacher! His name is Makame. He had frequently heard the missionaries preach without being much affected. But conviction apprehended him at last, and this is the manner of it, in his own language, contained in a letter from Mr. Wright, the missionary mentioned in the Narrative, published in the reports:—]

"Two years ago I paid a visit to my friends at Lattakoo, and, on my way home, I arrived on a Saturday at Blink Klip, where I halted for a short time, at the house of a friend, named Lukas Kok, a member of the church at Griqua Town. He said to me, 'You will not proceed to-day, to-morrow is the Sabbath, and you must not travel on the Sabbath. Here you can listen to the Word of God; but, if you proceed now, you must be on the road to-morrow, as you cannot get to Griqua Town in time to keep the Sabbath.' I replied, with apparent indifference, 'What have I to do with the Sabbath, or with the Word of God?' Lukas seemed much grieved at my wickedness, and, with a great deal of feeling, gave me a serious warning and exhortation. I felt deeply under his address, but determined not to yield, proceeded on my journey, and laid down to sleep in the evening, very uneasy in my mind. The Sabbath came, and my fears increased so much, that I dared not proceed that day, but remained still. On the Monday I arrived at Griqua Town, and called at the house of a pious female friend, who was a member of the church. The first thing she said to me was, 'Why, Makame, you must have been on the road yesterday; have you no regard for the law of God, for your soul's welfare, nor fear of death, or of the judgment to come? I tremble for your situation, and beg you will think, before you be carried away by death in your wickedness.' I made no reply; I did not open my mouth, nor lift up my head, for I felt as if doomed to everlasting destruction.

"In the afternoon, I left Griqua Town to proceed, and in

* The difference between an "*individual monarchy*" and a "*universal monarchy*," is that in the former the supreme power begins and ends in an individual, in the latter, it begins with the people or universal population, and merely centres in an individual, who, consequently, can have nothing to do with the succession.

the evening I met another good woman on the road, also a member of the church at Griqua Town; she said, 'Well, Makame, did you hear the word of God yesterday at Griqua Town?' I was confounded, and compelled to confess the truth. She addressed me in the same strain as the others, with much faithfulness and feeling. I left her and proceeded, my mind filled with horror at my awful condition, and fully expecting that some tremendous judgment of God would overtake me immediately.

"A few days after I arrived at home, a man belonging to Griqua Town came to our village, and, though not a member of the church, I considered him a good man. All his conversation was concerning the Word of God, and His work in the heart of a sinner. I remember he gave us the history of Noah and the flood, of Lot, and Sodom and Gomorrah, and of Abraham; and he also told us much about Jesus Christ and his love, and of the only way of safety for a sinner through him. The state of my mind became intolerable, and I resolved to go immediately to Griqua Town to hear the Word of God, and to speak to the missionaries. Accordingly, I left home, accompanied by a few of my companions, to whom I had already made known the state of my mind, and who were also, like me, the subjects of conviction, in the days of Mr. Read at Lattakoo.

"We arrived at Griqua Town towards evening, and I went at once to the house of one of the missionaries, that of Mr. Hughes, Mr. Wright being absent at the time. I told Mr. H. I came for no other purpose than to hear the Word of God, and made known to him fully the state of my mind. He manifested a deep interest in my case, and spent the whole of that evening with me to instruct me in the things of God. I retired to my lodgings with my heart filled with sorrow, and involuntarily crying out, 'What shall I do?' On arriving at the house where I had put up, a good man came and sung a hymn, and prayed with us, and now my sorrow broke forth in strong cries, and I went alone to the bush, but I could only weep. I could not pray. I felt as if my heart would break. The following morning I repaired again to the teacher, and he and one of the church members spent most of the day with me, instructing me in the way of salvation; but my agony of mind continued for some time. At length light broke in upon my mind; I understood God's way of saving a sinner through Jesus Christ. I was overwhelmed with the thoughts of the patience, the condescension, and love of God to me, the most wicked of men, and I found rest and peace to my soul by trusting in the Saviour. I returned home after a few weeks, and could not do otherwise than tell my fellow-sinners what God had done for my soul; many listened with attention and wonder, for I was a miracle of the grace of God, and the people could not believe their senses, that I was really the same Makame they had always known."

"Such slaves build temples for the Omnipotent fiend,
Gorgeous and vast."

Pray, what sign of conversion have we here? We have only a slavish fear of some diabolical judgment, and a reluctant obedience, on the part of Makame, to some outward observances, by way of appeasing the old God of his fathers, baptized by a Christian name, and clothed with a more fearful character.

VEGETABLE ARITHMETIC.

Though Plato of old called the Creator the Divine Geometrician, modern philosophers have been slow to observe the numberless instances of the operation of his adjusting mind, which all His works display. Indeed, it has not been remarked in the animal kingdom till our own day, and the merit of observing it, promulgating, and establishing it, is due to Mr. Macleay, who, though young in years at the time of his discovery, was ripe in the power of penetration, and spirit of arrangement. He has demonstrated, that the whole animal kingdom is constructed in a series which form circles of fives, (hence quinary arrangement, as this is termed), five of the subordinate circles making one primary circle, the amount or number of these primary circles being also five. (See Macleay, *Horæ Entomologicae*.

The remark, that five was a favourite number of Nature,* was made by Sir Thomas Brown, (see his *Quidnunc*) in 1656, and he supported its correctness by numerous instances drawn from the vegetable kingdom. Its applicability to an entire section of that kingdom was not, however, observed or demonstrated till a much later date; and now it is a well ascertained principle, that of the three great sections into which plants may be divided, according to their internal structure and mode of growth, each has a predominating number, which is displayed in the portions which constitute the flower (in the vascular or flowering plants), and along with which prevailing number, certain properties are invariably found to be conjoined. For instance, the first or lowest section of the vegetable kingdom consists of plants exclusively formed of cellular tissue, (hence called cellular plants), the prevailing number of the parts of which is two, or some regular multiple of two, as is best exemplified in the number of the teeth, or the peristome of mosses, which are either 4, 8, 16, 32, or 64. Such plants are remarkable, in general, for their freedom from any active principle, and, consequently, scarcely any of them are poisonous (fungi, or mushrooms, seem exceptions, but it is doubtful whether these singular productions belong to the vegetable kingdom). Hence, though a few of them yield dyeing principles, the greater number of them are only employed as food for man or animals, and may, in most instances, be fearlessly partaken of, by any one in danger of perishing for want of other kinds of food.

The next section of the vegetable kingdom possesses vessels of different kinds, in addition to the cellular tissue of the former, and are characterized by a particular mode of growth, namely, by additions to the interior (hence called Endogens), which accounts for the circumference of the stem, when once formed, never varying or increasing in diameter. These plants are at all times distinguishable by the manner in which the veins of the leaf run, (i.e. always in parallel lines) and have the portions of the flower arranged in threes, or regular multiples of three (see flowers of crocus, hyacinth, lilies, or tulips). This section contains plants which are scarcely more active than the former; and having neither bark nor wood as parts of their structure, are destitute of the peculiar products of these parts. Hence it is mostly for food that such plants are valuable, and their roots (or rather rhizomata) and fruits, or seeds, are the parts chiefly employed for this purpose, as the arrow-root, the seeds of the cereal grains, wheat, rice, &c.; and dates, cocoanuts, &c., are examples.

The remaining section of plants comprises those which grow by additions to the exterior (hence called Exogens), and which have the stems conical and branched, and the parts of the flower arranged in fives, or regular multiples of five. (See flowers of marvel of Peru, pink, rose, potentilla, apple, &c.) In these the leaves have the veins forming a net-work. They possess bark, and a perfect woody structure; and, consequently, all the principles, which are either formed or deposited in these. Among such plants are to be found the most active vegetable poisons, sources at once of injury and benefit to man; for, while the savage employs them only to destroy his enemies, whether of the brute or human kind, the skilful and benevolent physician converts them into instruments of great, nay, of unspeakable benefit to his suffering fellow-creatures.

So in the arts:—does the dremor of leather need an agent to assist him in tanning? he seeks, and finds it only in this section of the vegetable kingdom, as the astringent principle he requires is only lodged in the bark, as the oak, the willow, the larch, and others, which are employed for this purpose, attest. Again; are fixed oils required for any of the various purposes to which they can be applied, they are, with one or two exceptions, only to be obtained from this section of the vegetable kingdom. All kinds of gum, of resins, and gum resins, with scarcely any exceptions, are exclusively supplied by this section of plants.

It is unnecessary to add more examples to prove the advan-

* This is especially remarkable in the toes of animals. Indeed it is asserted by anatomists, that the *free* in embryo are distinctly seen under single hoofs and cloven feet.

tage of proceeding in our examination of the vegetable kingdom, in reference to its uses to mankind, according to principles which have their foundation in the unalterable laws of Nature, and, therefore, furnish the best and most certain guides. It cannot be doubted that the author of Nature intended these external marks and definite numbers to be indices or signs of internal properties; and instances might be given, where a very slight, and, as some might think, unimportant difference of external structure, furnished a key to an important difference of chemical composition.—*From a Paper by Dr. Dickson in the Naturalist: 1837.*

THE LIBERALS.

THE wind is a very formidable power, could you get it organized and submitted to your will. Mr. Etzler, in his "Paradise within the Reach of all Men," suggests a method of employing the power of the wind to some useful purpose, by means of a convention of windmills. He is even so ingenious as to propose a plan of transferring the mighty power of the ocean to the dry land; and thus, by these two high-mightinesses of wind and water, economizing the outlay of human capital and labour to such an extent, that there will be scarcely any loss whatever experienced in the production of human wealth. These are two very bold speculations—but they do not seem less practicable at present than the concentration of popular force upon a given subject, or the collection of the popular strength around a common standard.

The word "Liberal" is very sonorous. It has great pretensions to intelligence, rationality, science, justice, humanity, public spirit, honesty—in fine, to all the virtues, moral and intellectual. Moreover, there is great plausibility attending these pretensions. The Liberal is professedly the friend of the poor, and that is the highest moral rank that a living man can hold; he is professedly an enemy to political and ecclesiastical corruption, to hereditary privileges, monopolies, unmerited pensions, international warfare, religious persecution, and the thousand and one varieties of aristocratical tyranny, to which no generous and noble mind can yield a willing submission. Such are the professions of Liberalism, and in so far as profession is concerned, we cordially approve of its leading tenets; but, when we regard the sect in a *practical*, as well as a *professional* aspect, alas! alas! what a falling off is there! It now disappears entirely from the field of vision! It really does not seem to have a bodily existence. The pomp and circumstance with which it is enveloped is merely tinsel; it is nothing but typographical blarney—a newspaper puff—a large meeting at —shouts of applause—great excitement—hear, hear—important resolutions—carried unanimously—bills ordered to be printed—agitation to be commenced—the people to be excited, and stirred up to action—subscriptions to be set on foot—thirty or forty shillings collected—too little—printer's account not settled—no one responsible—all over—no go—adjourn to a public-house—order pipes—fill the room with smoke—spend the odds in ale or beer, and dissolve the parliament, to be called together again under a new name!

Now, whose fault is all this? We do not blame any man for it. The leaders are quite as sensible of it as we are. They are sorry for it—they cannot help it. But the secret of the whole matter lies in this, that there is a dissipation of the public mind, occasioned by a great variety of topics being presented before it, and a scepticism created in respect to the comparative value of each, which produces a whirlwind of thought and action.

Nothing can better demonstrate this truth, than the fact, that notwithstanding the boasted science and public intelligence of the liberals, they have never been able to organize a club, or public library, or institution of any kind, upon their own principles as a basis. The religious world, which they despise, is infinitely in advance of them in this respect. The British and Foreign Young Men's Society, has twelve branches, and twenty-eight associations! It has a reading-room, in which forty magazines and reviews, besides daily and weekly newspapers, are to be found!

and a public library, containing standard works on all subjects! Moreover, it distributes tracts and hand-bills, containing its own religious principles, to the amount of several hundred thousands per annum—and appoints preachers and lecturers to deliver oral instruction on particular occasions—and has surplus funds to offer a hundred guinea prize to the best essay on the duties which the Christian public owe for young men entering upon the career of public life.

A hundred guineas! who ever heard of a liberal association having a hundred guineas at its disposal! a hundred shillings are a rarity! and that, too, in a Society which professes to be a representative of the great body of the people. It really seems, as if the more national or liberal a society becomes, the less likely it is to obtain the confidence of the public purse, without which, in these mercenary times, no great national movement can ever be systematically made. These young men, above alluded to, are not rich, they are chiefly mechanics and tradesmen. They all belong to the lower and middle classes; but they have a uniform steady system of conduct, which begets confidence, and this confidence fills the subscription list. The Liberals have quite as much to spare as these have.

This confidence, or faith, call it what you will (we do not want to quarrel about words), the Liberals want. They know it. And how are they to procure it? by a concentration, or fixation of principle only. Their opinions are too discursive—their principles are loose; they want authority—they strive more after means than ends; and, while they are aiming at means, the very means they aim at are defective, and the ends are utterly neglected. Fundamental principles are actually not discussed, and hence the people are not instructed. We are morally certain, that if there were to be a revolution to-day, the people of England would play the game of the French and Americans. Their *beau ideal* of a practical system, is a speechifying Parliament! a thing which was never known, in the history of man, to transact business either expeditiously or systematically.

Next week we will treat of authority, a thing very much wanted now-a-days.

MODERN MARTYRDOM.—The spirit of martyrdom has entirely disappeared from the Christian Church. The sacrifices now made by the followers of Christ never interfere with the personal comforts, pecuniary or domestic interests, of the pious confessors. There is a very large party of Christian Sabbath-breakers, who say they are compelled to violate the sanctity of God's holy day, in order to meet the competition of the trade by which they live! They would lose their Sabbath forenoon's custom, if they shut up! This would certainly be paying too dear for salvation! If the fourth commandment cannot be observed at a cheaper rate than this, they say, then God must find other worshippers, for we cannot afford to sacrifice our custom to his service! The Archbishop of Canterbury made a long speech, some time ago, in favour of these worthies, whose case he said was a hard one. The apostles thought otherwise, for it was a maxim with them "to rejoice when they suffered for the name of Jesus." It sickens one of professional religion altogether, to compare the selfishness of its professors with the genuine spirit of the thing itself.

AUTHORITY.

But still this world (so fitted for the knave)
Contents us not: a better shall we have?
A kingdom of the just, then, let it be:
But first consider how those just agree.—*Pope.*

THE agreement of the *just* is the great difficulty. A hundred just men in disagreement, at the head of an association, would play a most dismal discord—with their justice. The just are more outrageous in their disagreement than the unjust. Their zeal infuriates them, and justice, pure justice, often becomes the scourge of nations, and the curse of society!

Miss Martineau says it has now become a question of public discussion in America, "whether an honest man with false principles, or a dishonest man with true principles, is the most safe depository of the public power?" If such be the case, the Americans are evidently somewhat suspicious of honesty and justice! What a sad plight society has come to, when honesty and dishonesty are entitled to plead their respective merits at the bar of public opinion, and the jury are at a loss with respect to their verdict!

The above question, however, is susceptible of a more favourable interpretation than that which we have put in exclamation points. It is a question between *universal* principles and *individual* honesty. Now the *universal* is always preferable to the *individual* interest. Hence we say, if there can be a dishonest man with true principles, let him have the preference, as a ruler, to an honest man with false principles; for honesty, directed by false principle, is practical dishonesty; but a dishonest heart, if guided by true and just principles, becomes practically honest. Now it is *practical* honesty that a people want.

What are called principles, are merely *modes* of action. If a ruler's modes of action are in conformity with the people's notions of right and wrong, the ruler is, by that very fact, invested with power supreme. He receives it from the will of the people. This is the *beau-ideal* of liberty. Moreover, it is *monarchy*. It is also democracy. It is democratical monarchy.

All power which does not originate in the will of the subject is tyranny, or at least called tyranny by the unwilling.

To obtain unanimity of will among one hundred people, whose interests are at variance, is impossible—ten have all the land, and ten the floating capital, and eighty have nothing but their flesh and bones. It would be no easy matter to find a president to please the hundred: indeed, it is an impractical machine.

This fact is so evident, that the greatest proportion of people seem to be thoroughly convinced of the impossibility of political tranquillity; the idea of *Christian* community is so abhorrent to the public mind! Hence it follows, that the next step lower in the scale of practicable government is most commonly embraced by the mass, namely, that of a great number of petty representatives, collected in an administrative cockpit, to settle each question separately, by a show of hands, after a long controversial discussion respecting a subject on which each individual has previously made up his mind. It is imagined, that if these representatives were chosen by the whole population, "all would be well,"

Now this is a system without a head at all. The mere chairman, or president, or king of such an establishment, is not a head, because he has merely a veto upon their proceedings, whereas it ought to be the reverse; they ought rather to have a veto upon *his*. This is so evidently a law of Nature, that in practice a system always approximates it more or less, whatever be its statutory form. A minister is called *strong*, when he can dictate to parliament and people, and he can only do so freely when he gives satisfaction; but a *weak* minister, one that cannot dictate, is not considered fit for place. Does not this show, that Nature teaches us, that authority should dwell with one, who is the representative of the popular mind? Perhaps there never was a form of government attempted which was not practically the same as the above, infinitely various as the models may be. If an individual rules the parliament, he rules the nation. You may call him king, emperor, president, czar, or sultan, or what you please; he rules the nation! the only real difference lies in the hereditary principle. So that the whole question of government reduces itself to a controversy between the hereditary and elective monarchy; but monarchy it *must* practically be. It is the *feebleness* of the *hereditary system*, that has made it necessary to have a *minister*; an elective monarch would *himself* be minister.

When the ruler, whatever be his name, acts in unison with the popular will, he acts freely, expeditiously, and effectively; his movements are rapid; there is a lightness and facility about them, which banish every idea of difficulty: but when he is weak, he can do nothing easily. Years are spent upon trifles; generations are born, dead, and buried, during the discussion of a single question, and the question at last, perhaps, hideously discussed by an appeal to instruments of human slaughter.

This is the great curse of human society; and the most obvious remedy for it is a universal suffrage system, as being the most practical method of expressing public will. The more free this expression of public will is, the better. This would be a final settlement of the whole question of government, if the public will were fixed and uniform. But there is a most fearful division in it. There is a deadly indecision in it; so much so, that in America, according to Miss Martineau, the Republicans complain that they cannot find men willing to represent them, and, therefore, they are obliged to select men who are opposed to their principles! This is mere fudge! In America, as in every other country, there is a chaos of opinion; and the Americans are actually looking out, in faith, as a people, for some special *Messiah*, to collect the scattered leaves of sibilism together. How can a people, consisting of landed proprietors, merchants, speculators, bankers, brokers, lawyers, manufacturers, mechanics, and paupers, be represented?

Mr. Owen, alone, could settle this question of representation, and show the people how they might be represented. Will they listen to him?

But the settlement of this question of representation is not enough.

Politicians, or materialists, or mechanicians, frequently forget that there is an immense mass of the population who are never affected by their arguments, whom *rationalism* cannot persuade, and in whom neither education, philosophy, nor

science can produce it. It is a common cant amongst the party alluded to, that ignorance is the cause of this. Ignorance! in such men as Coleridge, Kant, Wordsworth, Enfantin! It is a vain speculation! If ignorance it be, it is an ignorance which is far superior in knowledge, virtue, and power, to the thing that condemns it. It is not ignorance. It is a faculty, and a faculty, too, of a very high order. When viewed in its lowest character, amongst the ignorant and illiterate, the religious principle seems very contemptible, merely because it is meanly clothed with intellectual attainments, and frequently mixed with idle superstition; but when you regard it in its most elevated position, invested with the robe of science, of literature, of poetry, of philosophy, expatiating on the works of creation, and entering into the minutest details of the infinitely diversified organizations of vegetables and animals, and revealing myriads of unseen and unknown mysteries of the eternal Creator and his unlimited attributes! it is really too much to say, that it is ignorance that does all this! No; it is not ignorance; it is an elementary principle of human being, which appertains to the highest as well as to the lowest order of minds; which has been manifested in every age and country, and has almost invariably belonged to the most elevated rank of genius.

How is this element of humanity to be made use of in compounding our *beau-ideal* of authority?

This is a most important question. It is sneered down by the mere politician; but with all his sneering, he finds himself stranded on the very subject which he most of all despises. The Owenites and Infidels want to do without it. The Dissenters would merely let it loose, by unchaining it from the state. The Churchmen would shape it after their own parliamentary model, and make a Juggernaut of it! But still there it is, and what is to be done with it? Education will not remove it: the very best educated men in the country support it. Science will not suppress it, for it makes a league with science, and is one of the principal cultivators of natural philosophy. The fine arts will not put it down, for it has actually given birth to them, and in all ages been their *alma mater*. What is to be done with it?

It is no easy matter answering this question.

The thing itself has hitherto been a fiend in its political and social character; but, fiend though it be, it is worshipped. The Fiend! The Fiend! therefore, is our great obstacle. Depend upon it, it is no easy matter to get rid of the fiend! whether he assumes the name of Juggernaut, or Kalee, or the god that torments men for ever on account of a mistaken opinion in theological science. The Dissenters attempt to prove that his kingdom is not of this world, and that he has nothing to do with politics; but still he takes note of men's conduct in a foreign state, and punishes them hereafter most unmercifully. The Church says, that this world is his kingdom, and that he must share the power of the State, and be worshipped after one particular fashion. The Liberals say there is no fiend at all.

But the Liberals, unfortunately, want authority! Pedigree is a very curious and essential ingredient of authority. A mere novelty is always despised, in religion especially. The more ancient a doctrine is, the more respectability it possesses. Jesus Christ told the Jews that he did not come to destroy the law and the prophets, but to *fulfil* them. Moses acted the same part, for he kept up the pedigree of the institutions handed down from posterity; and thus it happens, that Christianity runs back as far as we can see. It has, therefore, antiquity, and all the authority which antiquity possesses. *Can the chain of descent be broken?* Can a new system arise which does not shoot like a twig from the old stem? Can a tree grow to maturity at once? and do full grown men and women drop down from heaven, or rise up out of the earth, in these wonderless days? We trow not. Hence, we *calculate*, as the Yankees cautiously express themselves, that, in the progress of society, the same system of grafting hitherto practised, must be kept up, and the *authority* of the old, combined with the liberality and reasonableness of the new. Until this be done, resistance will be so strong, that neither rationalism, nor eloquence, nor the prospects of social happiness, or of political tranquillity, will have the slightest effect in changing the convictions of

men. And it is right that it should be so, for the history of man is the history of Providence respecting men, which conceals a science necessary for man to know, before unanimity can be experienced in human affairs. The chain of this science, therefore, cannot be broken.

We think we hear some one say, in reply to this, that religion in America is quite disconnected with politics, and forms no item of the republican constitution. There never was a more mistaken notion. From all that we have read and heard of America, it is peculiarly under the influence of religion. If the people be religious, and their legislators be the representatives of the people, it is absurd to say that religion has nothing to do with the laws. It is infused into every particle of the constitution, and no political measure could pass the forms of enactment that was calculated to strike at the basis of Christianity in its generic character. If this is a fact, and we suspect it cannot be denied, America is essentially Christian in its political character. When France threw off the Christian yoke, burned the Bible, abolished the Sabbath, proclaimed death an eternal sleep, and paraded an image of *Reason* through the streets, as the new God of that fickle and precipitate people, it made a bold attempt to go beyond what America ever contemplated. But it was a mad attempt; the goddess was lampooned and ridiculed so smartly by the wags of Paris, that she was obliged to retreat into perpetual obscurity soon after her first appearance in public—the Sabbath was speedily restored by the public reaction—the Bible and the priests were recalled—and, in the very year in which its recall took place, the Bible Society commenced its gigantic efforts, which have given a curious turn to the drama of the philosophers, who boasted of having “*ecrasé l'infame*,”—“crushed the wretch” for ever. Could, or dare the government of America do the same? A nation of mere rationalists could, and, probably, would imitate this example; but the Americans are so far from being rationalists, that it is to the United States, in particular, where we must proceed, if we wish to witness the effects of the wildest species of devotional enthusiasm. There is, probably, more of the influence of Christianity exercised on the government of America, than upon our own legislature, although ours has taken holy orders, and decked itself in the canonicals of Popish priesthood.

How, then, is such a system as that of Mr. Owen to succeed, if it be based upon an abjuration of Christianity? That Mr. Owen should pick up a few followers, willing to receive his system upon such terms, is not to be wondered at. There were infidels in the world before he was born; and, two hundred years ago, this country was more bespread (if we may judge from the press, at least,) with Atheistical opinions than it is now. But they never, in any age, have been able to win the affections, and inspire the confidence of the public. Even, with all their rationalism, and they are not without strong and plausible argument, like other parties, there is something about their doctrine which seems heartless and chilling; and, whether it be mere imagination, instinct, prejudice, romance, or imbecility, which shrinks from it, it is a fact, that the mass of the people do shrink from it, on that very account for which its advocates so warmly recommend it.

We candidly acknowledge that we are equally offensive to the religious world, as they at present understand us. But there is this difference between us and the Owenites, that we acknowledge the Divine authority of Moses and Christ; and, without proposing to keep up the peculiar systems of each, merely claim the privilege of legitimate successorship, by showing that their unfinished systems contained, in embryo, one more perfect. We bring a social system out of Christianity; but we acknowledge the parentage, and employ the authority, and use the Bible as a text-book, to prove, that in the course of ages a new system must arise, based upon the principles of universal brotherhood, and community of interest.

Mere scientific nature is very little authority. Science has very little hold upon the people, even upon those who profess to be guided by it. Antiquity has more. The custom of eating roast-beef and plum-pudding, at Christmas, has a powerful hold, even upon the infidels themselves, who would not like to abandon it. We question if any scientific motive will ever

produce such a unanimity of sentiment. There is a satisfaction attending it, experienced by all, and understood by all. Could science suppress such a custom? Could rationalism do it? Religion has already done it. For the custom was suppressed in Scotland at the Reformation, and nationally abjured to this day, merely because St. Paul disapproves of keeping particular days. There is an electricity, an authority, about a religious motive, which science has never been able to imitate. If men are not so ceremoniously religious now, they are still, at least, gratified when religion is found to sanction their conduct.

To obtain authority, it is necessary, in our opinion,—*first*, that the governing power have the *sanction* of Christianity; *second*, that it be the representative of the general *will* of the population in respect to political interests.

THE TRANSCENDENTALIST'S DIALOGUES. No. III.

ON "THE ONE"—(Continued from p. 21.)

Transcendentalist and Materialist—(a child playing in the corner).

Mat.—Let us pursue our very interesting inquiries. Ever since we parted, have I been reflecting on the result to which we came, namely, that we are to seek for "the one," not in the things united, but in the bond of union that connects them. What we have to consider is, what this bond of union may be.

Trans.—Exactly. We consider this piece of wood, as composed of a number of small particles, which are in themselves a *many*, but which being bound together become a *one*. And here understand, that by "small particles" I do not mean ultimate particles, or self-existing atoms, as I think we have found that such atoms do not exist at all. But I merely mean such particles that we can actually see and feel in the shape of chips, saw-dust, &c.

Mat.—Of such particles I speak; I have done with the atoms altogether. Now what binds these particles is the attraction of cohesion; that is the *plus* (+) which connects the X, Y, and Z; let us therefore, as we are searching for "the one," carefully examine the "attraction of cohesion."

Trans.—I see the course you have marked out, and will readily pursue it. We are to find out whether this attraction be not the very "one" we are in search of. Good! This child may perhaps throw some light on our inquiries. Here, little one! (*holds up wood*). What is this?

Child.—Wood.

Trans.—Aye, but is it one piece of wood, or several pieces?

Child.—One, to be sure!

Trans.—And you call it one, because you perceive the attraction of cohesion that unites the particles.

Child.—The attract—att—the what?

Trans.—What, you do not know what the attraction of cohesion means? Well, you may not know the words, but still you may be aware of the facts. Are you aware that the particles of matter are endowed with a certain power by which they are held together?

Child.—No!

Trans.—No! Then how do you know that this is but one piece of wood?

Child.—Why? I know it, because I do.

Trans.—There, you see the child has not the slightest notion of your attraction; yet knows as well as yourself that this piece of wood is but "one."

Mat.—True; but still the oneness may be the result of attraction.

Trans.—Perhaps so. But that is not our affair at present. We are not enquiring what is the cause of the *one*, but what is the *one* itself. A child may be perfectly familiar with a pudding, without being intimate with the cook, or having the slightest knowledge of the culinary art. Thus this child knows this piece of wood to be *one*, but has never thought what caused

this quality; remember our axiom: "every word that is not sheer nonsense has a signification." Now, when this child calls a thing, "one thing," it is perfectly intelligible to another child as ignorant of attraction as itself. The two children can talk of *one* ball, *one* top, they do not talk nonsense; hence the word "one" in their mouths has a signification, which is totally unconnected with any notion of attraction.

Mat. Stay, stay, I have a thought yet! Look here, child, I have split this piece of wood in two; now I hold the pieces close together. Is this one piece of wood, or two?

Child.—Two held together, so as to look like one.

Mat.—And yet it looks the same as before it was split. Why do you now call it two, when you before called it one?

Child.—Because now, if you opened your hand, the pieces would fall apart.

Mat.—Ha, ha! I knew that would be the answer! Though the child did not understand your expressions, its notion of oneness proceeded from its notion of attraction. It says that it now calls the wood "two," because, when I cease to hold it, it will fall apart. That is, it was "one," as long as the attraction of cohesion was sufficient to hold it together, without any external force—*two*, as soon as the attraction was not sufficient; and yet, you see, the wood presented the same appearance to the child in both cases. I held the parts so firmly together, that it looked as much like one piece, after cutting, as before; yet the child, aware of the diminution of the attraction of cohesion, declared it to be "two."

Trans.—I confess you have defended your views of the child's notion of attraction with considerable ingenuity. But mind, what the child has said, merely refers to the *oneness* of a piece of wood, with which, as you rightly observe, attraction has something to do. But, perhaps, we may find the child making use of the word "one," when there is no attraction whatever, or at least so slight an attraction as not to be perceivable.—(*An applewoman passes under the window, crying "Apples! a penny a lot."*)—Here, my good woman, come in!—(*Enter woman.*)—Now, child, here is a penny, buy *one* lot of apples. There, do you observe? the child has taken *one* lot, which was *three* apples. My good child, how did you know that those *three* apples were *one* lot?

Child.—Because they lay together.—(*Exit woman.*)

Trans.—There, now you see the child has a notion of oneness altogether distinct from that of attraction, as there is no *apparent* attraction between several apples; and if the two pieces of wood had been sold in twos, there is no doubt but the child would have called them *one* lot.

Mat.—You are right. And though the attraction of cohesion may produce a *oneness*, yet the *oneness* may exist where there is no attraction, and, as you say, the pieces of wood, if sold in twos, would have been *one* lot. Stay, stay, methinks I see a light now. The child saw that the apples were *one* lot, "because they lay together;" and now I see, that we must seek for the "one" in *contingency* alone, and not in the cause of *contingency*. In fact, the individual piece of wood was called "one," because the contingency was more lasting than after it was split. It is in *contingency*, and nothing but *contingency*, that we must seek for the *one*.

Trans.—What? However heterogeneous the things in contact may be, do they still constitute a *one*?

Mat.—Yes, yes; they still constitute *one* something or other.* Pitch, bottles, old bones, bits of rag, chips of wood, altogether—What do they constitute? *One* heap. Tie what you like in a piece of cloth—What have you? *One* bundle. Look at houses, churches, trees, rivers—and there is *one* prospect; and it is the contingency that constitutes the *oneness*. Look over the way; there is Smith's house, and Thompson's house, and a field between them; well, Smith's house, and Thompson's house, do not form *one* prospect; but throw in the field, and then we have the prospect. And why? Because the field fills up the gap, and, as it were, touches both houses. I see I have altogether been on a wrong scent. I have been

* Those of my readers who understand my dialogues will not be offended at the continual recurrence of the same title, as they will perceive to what a multitude of results the different investigations lead.

* Something like this will be found in my article in *Shepherd*, vol. ii. p. 40, but the similarity is unavoidable, and the result to be drawn is of a more comprehensive nature.—T.

bothering myself about the cause of contingency, without looking sufficiently at contingency itself.

Trans.—Now, then, we have to inquire into the nature of contingency. When are bodies said to be contingent?

Mat.—When they occupy one continuous portion of space; by which I mean, that a portion of space may be marked out to contain *them*, and nothing but *them*: so that in passing from one, and confining yourself to this same portion of space, you immediately come to the other. I can render myself clearer by example: I will place a small pile of coins at this end of the table, and another pile at the further end: now these are not contingent, because I cannot pass immediately from one to the other. Now I have placed them, so as there is no intervening space, I can pass immediately from one to the other, and I pronounce them to be in contact, or contingent.

Trans.—Then it appears that things are contingent, and consequently a *one*, (as *e. g. one heap, one lot, &c.*) when they occupy by themselves a snug portion of space, to the exclusion of every thing else.

Mat.—That is it. Things are *one*, when they occupy *one* portion of space.

Trans.—Good heavens! Our inquiries are pushed to a further extent than ever. Things are *one*, so far as they occupy *one* portion of space! We must now try to find out what constitutes *oneness* in space. To this have our investigations on contact led; the very definition of contact, involving in itself the occupation of *one* portion of space.

Mat.—Good by, good by; I have food for reflection for another week; and till we meet again, shall amuse myself by beating about the regions of space.—(*Exit.*)

Trans.—Yes; our dialogues on the "*one*" are leading us a pretty chase. We have now got to space, and my good friend is wrong if he thinks to stop there. He forgets that there is such a thing as *one* hour, which does not occupy any space at all. — (*Sits quietly down, and reads Fichte's Grundlage.*)

THE TRANSCENDENTALIST.

TO THE EDITOR OF THE SHEPHERD.

THE gallery of Pantheism, namely, the doctrine of Spinoza, must, for a while, give place to the letters which a friend of mine has translated from the German, under my direction. The name of Schiller is well known to our readers. His dramatical and historical works have been rendered familiar to the English, by the efforts of Coleridge, Moore, and others. His life has been described in a masterly style by Carlyle of Glasgow. These letters will make him known as a philosopher; in which quality he cannot fail to gain the patronage of the readers of the *Shepherd*. Moreover, I think the object of these letters of paramount importance for our present times, in which the mind, totally absorbed in political discussions, seems dead to all which have no immediate connection with the affairs of the State. The reader will find that Schiller has anticipated the opinions publicly advocated by the Editor of the *Shepherd*, and by Hermes, that, unless the regeneration of man, through the development of the divine principles, precedes political reforms, all attempts to better the condition of the State turn out abortive and mischievous.

I hope that Schiller's voice will contribute to render our opinions more palatable to our political friends; and that they will acknowledge, with gratitude, the efforts of the gentleman who has favoured us with such a correct and interesting translation.

HERMES.

ON THE CULTIVATION OF THE HUMAN BEING.

By SCHILLER.

IN A SERIES OF LETTERS.*

LETTER I.

You kindly allow me to lay before you, in a series of letters, the result of my researches into beauty and art. I have a lively sense of the weight, as well as of the attractiveness and

dignity of this undertaking. I am to speak on a subject that stands in immediate relation to the best portion of our happiness, and in no very distant connection with the moral dignity of human nature. I am to plead the cause of beauty before a heart which feels and exercises its whole power, and which, in an inquiry where one is so often necessitated to appeal to feelings, as first principles, will take the most difficult part of my office on itself.

What I would ask of you as a favour, you generously convert into a duty, and leave me the credit of a meritorious service, for a work proceeding merely from my own inclination. The freedom of the course that you prescribe presents no obstacle; but rather, it is a requisite for me. Being little practised in the use of scholastic forms, I shall scarcely be in danger of sinning against good taste by the abuse of them. My ideas, derived more from uniform intercourse with myself, than from a fertile experience of the world, or from the study of books, will not disown their origin. They will be found guilty of any other fault rather than of sectarianism, and will sooner fall through their own weakness, than be upheld by authority and foreign strength.

Certainly, I will not conceal from you that the following assertions rest mostly upon Kantish principles. But ascribe it to my inability, not to those principles, if, in the course of these investigations, you should at any time be reminded of any peculiar school of philosophy. No; the freedom of your mind shall be to me inviolable. Your own feelings shall furnish me with the facts upon which I build; your own free course of thought shall dictate the rules on which I am to proceed.

Concerning those ideas which predominate in the practical part of the Kantish system, philosophers only are at variance; but men in general, as I trust to prove, have at all times held the same opinion. When freed from their technical form, they appear as the antiquated maxims of common sense, and as the facts of that moral instinct which the wisdom of Nature hath appointed as a guardian for man, until a clear understanding constitutes him of age. But even this technical form, which truth secures to the understanding, she hides from the perceptive powers; so that the understanding must painfully destroy the object of internal sense, in order to use it for its own purposes. The philosopher, like the chemist, discovers the union only by disuniting the parts: only by the torture of art is made manifest the work of spontaneous Nature. In order to grasp the flitting image, he must force it into the fetters of rule; must mangle its beautiful body into ideas, and confine the living spirit in a beggarly skeleton of words. Is it a wonder that natural feeling is no longer to be found in such a counterfeit, and that truth, exhibited in the report of the analyst, appears a paradox?

Grant me, then, your indulgence, if, in the following researches, inasmuch as the subject is presented to the understanding, it is, in the same degree, withdrawn from the senses. What holds true as the testimony of moral experience, must, in a far higher degree, hold true of the manifestation of beauty. The whole of the magic rests in the mystery; it is by the necessary combination of its elements that the being is upheld.

LETTER II.

BUT shall I not very easily be able to make a better use of the freedom that you grant me, than to occupy your attention on the stage of fine art? Is it not, at least, untimely to provide a book of rules for the use of the æsthetic world, when the concerns of the moral offer a much nearer interest, and the spirit of philosophical inquiry is so urgently called on, by the circumstances of the times, to employ itself in the most consummate of ancient works of art,—in the construction of true political freedom.

I would not willingly live in another century, nor have laboured for another. Man is even as good a citizen of time as he is of the state in which he dwells; and, if it be not becoming, nor scarcely allowable for a man to exclude himself from the customs and usages of the circles in which he lives, wherefore should it be an inconsiderable duty, in choosing his mode of working, to concede a voice to the necessities, and to the taste of the age.

* Addressed to the reigning Duke of Holstein Augustenburg, and first printed in the *Horen*, in the year 1795.

This voice, however, seems nowise to incline in favour of art, and, least of all, to that kind of art which is the object of my researches. The course of events has given to the genius of the time a bias, which threatens to estrange it more and more from ideal beauty. This last must let reality alone, and elevate itself, with becoming boldness, above the wants of the real; for art is a daughter of freedom, and, from the requirements of mind, not from the poverty of matter, will she take instructions. But now want rules, and bends debased humanity under his tyrannous yoke. Utility is the great idol of these times: for it, all powers are to drudge; and to it, all talents are to do homage. In its gross scales the spiritual devotedness of the artist hath no weight; and, robbed of all encouragement, vanishes from the brawling market of the age. Even the spirit of philosophical inquiry despoils the imaginative faculty of one province after another, and the limits of art are narrowed as science extends her bounds.

Philosophers, like politicians, turn their eyes, full of expectation, towards the place of political exhibition, where now, as men believe, the destiny of mankind is to be decided. Does it not then betray a blameable indifference to the welfare of society, to take no part in the universal talk? As this great question of right, in its constituent parts, or in its consequences, excites such interest in every one who calls himself a man, it must be especially interesting to every independent thinker. A question which formerly was answered only by means of the blind might of the stronger party, is now, as it appears, to be made amenable to the tribunal of pure reason; and whosoever is able to take his seat in the centre of the whole, and to raise himself to the standard of the species, may venture to consider himself an assessor at the judgment of reason, since he, both as man, and as citizen, is equally a party, and beholds himself more nearly or remotely involved in the result. It is thus not merely his own case that in this great trial of right comes to the decision, it is to be declared according to the laws, that he, solely as a reasonable spirit, is capable, and endowed with right, to dictate.

How attractive might it be for me to investigate such a subject with such a spiritual thinker, and so liberal a citizen of the world, and to commit the decision to a heart that dedicates itself, with beautiful enthusiasm, to the welfare of humanity! How agreeably surprising to me, in such a diversity of position, and at the great distance which the relations in the actual world render necessary, would it be to meet your unprejudiced mind on the field of the ideal in the same result! But I withstand all the charms of this inquiry, and let beauty precede freedom, believing that I shall be able, not merely to exult upon my conduct on the plea of inclination, but also to justify it upon the ground of principle. I hope to convince you that this subject is less alien to the wants than to the taste of the age, and that man, in order to solve the political problem in practice, must traverse the æsthetic path, because it is through beauty that man arrives at freedom. But the proof of this truth cannot be made apparent, without recalling to your mind the principles by which reason chiefly acts as guide in political legislation.

ANALOGIES.

We have often pointed out the analogies of Nature, in order to impress upon the minds of our readers the idea of a universal harmony. This is the genuine music of the spheres; but it is not confined to what is vulgarly called Nature, it is to be found in Providence also. Witness the following specimens, in which there could not possibly be any human concert to perfect the resemblance:—

The original colours are only three in number—Blue, red, and yellow. Walker, in his Principles of English Pronunciation, informs us that there are only three pure or original vowels, *a, e, o*; the rest being compound, or impure vowels. He makes seven vowels in all, *w* and *y* being vowels at the end of a syllable. This makes up the amount of the generally received number of seven colours in the solar ray. Some prisms make five, which is equal to the fixed vowels. The sacred orders of the Catholic Church are three—bishop, priest, and deacon. There are four inferior orders—clerk, acolyte, reader, and door-keeper, which are not accounted sacred, but still re-

quire ordination. The English titles of nobility are seven, three of these belong exclusively to the House of Peers—Archbishop, Duke, and Bishop; the other four are common, or *impure* titles, which are capable of sitting in the House of Commons. The musical octave, and the solar system, are divisible in the same manner. (See *Shepherd*, vol. i.) The seven senses (eyes and ears being reckoned double) are subject to the same primary law of harmony. Even the vegetation and fructification of a tree are similarly arranged. The root, the stock, and the branches, are perennial, or fixed; but the leaves, blossom, fruit, and seed—are deciduous or annual. The parts are seven in all.

These are beautiful analogies which sanctify this number, and the division we have given of it—namely, three-four.

There is another view of the number seven, which is equally interesting, and has been equally prevalent amongst men; namely, that which makes an octave of it. The beast with seven heads, in the visions of revelation, had also an eighth head, which was of the seven. "In the ancient traditions of the Phenicians," says Godfrey Higgins, in his *Celtic Druids*, "the Cabiri are said to have been seven in number, and to have had an eighth associated with them, under the name of Esmun. It was the same with the Cabiri of Egypt, who represented the seven planets, with *Pthas* at their head, making the eighth. The very same history is related by the Irish. Their gods, or Cabiri, were said to have been seven in number, and to have had an eighth associated with them, under the name of Saman (the Evil-Spirit, or Saviour, God of Death, last of the Cabiri). * * * The seven planetary gods, or gods of fire, were considered each as a god by himself—a person. But the whole were considered another, which formed the eighth. They might be considered correctly as seven persons and one god. There is no form of language to convey the idea, except that used for the Christian trinity. As the Christian trinity consists of three persons, and one God, so the Druid system consisted of seven persons, and one God; and this formed, afterwards, the ever happy Octoad of the Christian heretics, Valentinus, Basilides, and Bardasanes." But the God of Christianity is an Octoad also, as well as the God of other nations. St. John speaks particularly of the seven spirits of God; and Christ is represented as holding the seven stars in his right hand, and standing in the midst of seven golden candlesticks, he himself being the eighth, like the sun amid the seven primary planets. He is also represented as a lamb with seven eyes; and the God of the Jews is represented by the prophet Zechariah as having seven eyes, which go to and fro throughout all the earth.

Now, the analogy between these, and some modern octaves, is very striking. The musical octave is their perfect counterpart, there being seven notes in the monochord, and the eighth, which is the beginning of a new series, is necessary to the existence of the seven, and is called an octave. It is, and is not, of the seven. It is the same with the week. Our Christian Sabbath being posterior to the Jewish, becomes an eighth, and holds the same place in the week, that an octave holds in the monochord. The seven orders of nobility, become eight by the king, who includes them all as the source of honour. 'Tis the same with the Pope, and his seven holy orders. White, upon the same principle, becomes the eighth of the seven colours, by being the fountain of each, or a compound of all; and *h* becomes an eighth vowel, by sounding with all the vowels in such a way as to lose itself in all. The common people of England lose it entirely,—thus, with an Englishman, *ha, he, hi, ho, hu, why*, are the same as *a, e, i, o, u, y*, to other people! No other letter but *h* is so accommodating; and, even with accurate speakers, it is merely an asperate to a vowel, when placed before it, and is utterly lost when final; thus, *ah, eh, ih, oh, uh*, are the same as *a, e, i, o, u*.

These analogies are variegated, no doubt, but the same principle prevails in all, and there is no invention or design of man to cause a resemblance. They might be carried much farther. These are specimens of a new science in embryo, which will harmonize all Nature and Providence. "The harmony of the sciences," says Lord Bacon, "that is, when each part supports the other, is, and ought to be, the true and brief way of confutation and suppression of all the smaller sort of objections."

PLATO'S REPUBLIC, OR SOCIAL SYSTEM.

No. I.

WE now begin to fulfil the promise we made in No. 1., of giving an outline of all the most celebrated *beau ideal* systems of society, which have been proposed by philanthropists to mankind. The task is arduous and responsible. We must abridge, and in giving a curtailed account of what the different authors have discussed, with much circumlocution, ingenuity of argument, and eloquence of diction, we become liable to the reproach of wilful misrepresentation, or imperfect comprehension of the subject. Our own conscience will acquit us of the former; and in order to avoid the effects of the latter, we shall, as much as possible, use the language of the authors themselves, to corroborate our statements, work out our details, and finish our pictures.

Plato was born about 2267 years ago; he was a most profound metaphysician, the disciple of Socrates, and the father of mysticism. His philosophy has been, to a considerable extent, incorporated with Christianity, and forms, at the present day, a part of the doctrinal systems of all the Christian churches. The principal difference between Plato and a modern divine of the Catholic school, lies in the names of God, and the Gods. The Protestant, also, may see his own image reflected from the works of the Great Master of Spiritualism, in whose writings are to be found, in embryo, every great leading doctrine which has agitated society since his time.

It is reasonable to suppose, that such a master of metaphysical thought would found his system upon a metaphysical basis. This he has done. He puts it all into the mouth of Socrates. It seems, indeed, as if Socrates wrote the Republic. It begins with a most elaborate analysis of political justice, contained in a conversation between Socrates, Glauco and Adimantus (Plato's two brothers) and Thrasymachus. Justice is discovered to be that principle, according to which, every man is put in his proper place in society, and pursues that employment for which Nature has peculiarly fitted him. "I do not mean," says Socrates, "as to external actions only, but that which is really internal, relating to the man himself, and those things which are properly his own, not allowing any principle in himself to do what belongs to others."

This justice is a compound of three virtues, which require some explanation, as being the basis of the Platonic system. There are, according to Socrates, three original elementary principles within us, viz. reason, anger, desire—all our motives of action belong to, one or other, or all of these. Neither of these is a virtue in itself. Mere reason may be virtuous or vicious; anger may be virtuous or vicious; desire may be virtuous or vicious; but each of these has a virtue corresponding to it. Reason has the virtue of prudence—anger, of fortitude—and desire, of temperance. Prudence, fortitude, and temperance, therefore, become the primary virtues, and justice is merely a compound of all. The whole three-four thus forming a musical monochord, according to the Grecian system of music, called diatessaron. Music is, therefore, the basis of the Platonic republic.

Again, reason is a governing principle; desire is a petitioning, or governed principle; anger partakes of the nature of both—being a governor in respect to desire, but a subject in respect to reason. Anger is, also, an ambitious principle, a power-loving principle, and a power-wielding principle; in other words, an inferior governor. Prudence is, therefore, supreme ruler, fortitude is an auxiliary, and temperance is a subject, in the well regulated human system. This well regulated human system, Socrates regards as the model of a political system; and hence, he concludes, that there must be governors, auxiliaries, and mercenaries, in every civil polity; and if these are properly selected and employed according to their respective talents, the result will be political justice.

But now the great difficulty remains—the appointment of all these individual parts of the great machine to their proper places. Socrates proceeds very systematically to work, by taking a number of youths, and training them artificially, persuading them that they were formed in the earth, which is their common mother; and that when God formed them, he mixed gold in some, silver in others, and brass or iron in others;

that those who have the gold are destined to be governors; the silver, auxiliaries; the inferior metals, agriculturists and mechanics. When the various qualities reveal themselves, they are to be separated and devoted to their respective callings, a place is to be selected for a city, and thus the new community begins, with its earth-born children.

The system of training consists of two parts, music and gymnastics. By music, however, Plato understood more than we now attach to the meaning of the word. Music, according to Socrates, is intellectual and moral harmonics; that principle which creates symphony of thought, of speech, and of action, and wages perpetual warfare against all the jarring discords of the soul. The music of sound is only the type of this; but the type is good, and the word music is, therefore, the most appropriate word to represent it. This music, or doctrine, says Socrates, is of two kinds, *false* and *true*. The false is first taught. "I do not understand what you mean," said Glauco. "Do not you understand, said I, (Socrates) that we first of all tell children fables?" This is the most simple and natural method of commencing education. Socrates then proceeds to criticise the fable makers, and subject them to the censorship. He is sore upon the poets. He says they misrepresent the gods, by making them ridiculous, false, deceitful, and subject to every other species of moral deformity. "God is essentially good," he says, "and cannot do evil. No other than God is the cause of our good things; but of our evil we must not make God the cause, but seek for some other. We must not, therefore, permit either Homer, or any other poet, to trespass so foolishly, with regard to the gods, as to say,

Two vessels on Jove's threshold ever stand,
The source of evil one, and one of good.
The man whose lot Jove mingles out of both,
By good and ill alternately is ruled:
But he whose portion is unmingled ill,
O'er sacred earth by famine die is driven."—Homer.

"Nor yet must we suffer the youth to hear what Eschylus says:—

'Whenever God inclines to raze
A house, himself contrives a cause.'

"To say that God, who is good, is the cause of ill to any one, this we must by all means oppose, nor suffer any one to say so in his city, nor must we permit any one, either young or old, to hear such things told in fable, either in prose or verse."

The poets are also to be interdicted from representing God as appearing in different shapes, deceiving men, and playing the mountebanks. Do you think they do so? said Socrates. *Perhaps* said Adimantus. What, said Socrates, can a God cheat, holding forth a phantasm, either in word or deed? *I do not know*, said Adimantus. Socrates finally concludes: "God then is simple and true both in word and deed; neither is he changed himself, nor does he deceive others, neither by visions, nor by discourse,

* It must here be observed, that "ho theos," is the expression used by Plato, and may mean either "God" or "the God." Now Plato believed in a universal God, and in inferior Gods; which inferior Gods are in fact the proper objects of ceremonial worship, the former being a spiritual omnipresent power in unison with creation. Plato's was a sort of Catholic system of mediatorship. It is possible, therefore, that he meant that the Gods should always be represented as good only, even though the Demiourgos or infinite be the source of both evil and good. There is some obscurity on this point, but the text, as we have given it, is evidently the doctrine of modern divines, which the poets, the priests of Nature, have stoutly combated.

† It was a general opinion amongst the ancients that God deceived mankind, and if Plato rejects this article in theology, he receives it in politics, when he tells us that falsification may be employed as a drug by magistrates, and as tactics by a general. Nay, he allows the poets to falsify, but says they must be condemned when they do not *lie handsomely*. If then, the principle be thus admitted in respect to governors and teachers, we do not see how the philosopher can reject it, in respect to the universal governor and teacher, who has evidently employed it both in science and revelation.

nor by the pomp of signs, neither when we are awake, nor when we sleep." The poets are to be enjoined to teach this fundamental truth. They are also to be debarred from teaching the vulgar doctrines respecting hell and its torments—such passages as

"The soul, like smoke, down to the shades,
Fled howling."

are to be strictly forbidden; or,

"With both his hands
He poured the boiling dust upon his head."

The poets are thus to be subjected to the censorship of the governors—and all fearful and incongruous images of God and Nature to be suppressed. The *true* species of music then follows; namely, philosophy and dialectics (or *reasoning*, the gymnastics of the mind). The pupils are taught to regard each other as brethren, and to hold all things in common, only preserving the distinction of the gold, silver, and baser metal, natures, as gradations of rank. Gymnastics of body and mind are, however, postponed till maturity.

(To be continued).

MISSIONARY ZEAL.

JOSEPH WOLFF.—THE ST. SIMONIANS.

THERE is no species of zeal so ardent and untiring as that induced by religious bigotry. What astounding feats have been performed, what fatigues endured, what disregard of life evinced, under its influence! The career of the celebrated Joseph Wolff, who has been for many years traversing the globe in all directions, endeavouring to convert to Christianity that most unconvertible of all people, the Jews, is a remarkable instance of the amazing undertakings it will prompt man to enter upon. In a recent number of the *Bombay Christian Observer*, we find the following extract of a letter from him, dated Suez, 4th of May, 1836:—

"I am going to Jiddah, thence, God willing, cross over to Masowah, and from thence, I intend to proceed to the capital of Abyssinia, Gondar, where the Jews called *Falasha* are residing. After having stopped with him four or five months, and given also Bibles to the Christians, I intend to go to Shoah, thence to Narca, or Enarca, where Christians are, and thence to Timbuctoo, and the Cape of Good Hope. Should I not be able to succeed to those places from Narca, I intend to go from Narca to Melinde, Mozambique, and the Cape of Good Hope. And, after having proclaimed the tidings of salvation in the Cape, I intend (D. V.) to come again to Bombay, thence to Candahar, Kokan, Yarkand, Orenburgh, Kamshatka, Petersburg, America, Marseilles, and Malta. The journey will take me again three years and four months. Oh! dear Wilson, it is a glorious office to be made an instrument of preaching the tidings of salvation through all parts of the world; and I know that the gospel is a light which kindles the fire of the love of God, in the sinners heart in a manner inconceivable. Let us, therefore, disregard the censure of the world, and go on exclaiming,—CHRIST THE LIGHT OF VERY LIGHT."

We must admire the force of spirit which leads him on to such a task as he here proposes to himself; we cannot, however, after reading the annexed passage from his journal, dated Alexandria, 7th of February, 1836, say so much of his charity.

"I met one of the St. Simonians in the streets of Alexandria. He observed that Mons. Dussop had died in his religion. *Myself.*—Of what religion are you? *Mons. Colin* (this was his name).—Of the St. Simonians. *Myself.*—How is your Pere, Mons. Enfantin, going on? *Mons. Colin.*—Oh, he is a great man; he lives now with the peasantry of Egypt (*Felaha*), and eats like a *Felaha*, sleeps like a *Felaha*, and shoots like a *Felaha*? *Myself.*—Has he lice like a *Felaha*? I then asked him why so many of them had turned Mahomedans? He replied, 'In order to make ourselves loved by the Mahomedans.' That contemptible and unprincipled sect is now generally despised in Egypt. Enfantin, their pope, lives with three St. Simonian women, who, sometimes with his knowledge, give themselves over to public prostitution. It must

be said, to the honour of the French Consul of Cairo, that he expresses his contempt for them. A horrid sect; they deserve to be whipped out of every civilized country, and banished to the Cannibals of Africa. I have no mind to preach to such pigs."

No; it is of no use for Joseph Wolff to preach to Enfantin. But why has he *no mind* to do it? not, surely, because the St. Simonians are great sinners, but, because they have *minds* to resist his doctrine; and he contrives to satisfy his conscience, and keep alive the prejudices of the public by repeating the infamous slander of the enemies of men, whose principle fault is, that they are in advance of the Christian and Mahomedan Barbarians who abuse them. We must hear the opposite side of the question before we believe the vilification of this young convert to Christianity, who, like all other novices, is infuriated with hatred against every view of a subject, but that which the Lord has been pleased to astonish him withal only a few years ago. He is running like a mad dog over the whole world, foaming at the mouth, and grinning at all, but biting no one. If he has not got *l—c*, he has evidently got hornets or gnats about his ears, for he travels like an Abyssinian bull in the dog-days, whom neither brake, nor fence, nor river, nor pond, can stop in its fierce career, but who plunges headlong among shrubbery and mud, running water, or stagnant, and then falls at last of exhaustion, a martyr to tickling. What has Joseph done with all his travelling? He has merely visited different countries, and jabbered a little in an unknown tongue to a few savages, who wondered at his odd appearance, and style of speech, listened with curiosity to the strange vagrant, and then went home to tell their friends what a funny old fellow they met, who told them they were all in error, that God was not known amongst them, and that they would all be everlastingly damned if they did not believe that he was in the right. We suspect the St. Simonians are more practical men, but still we cannot inform our readers what they are about in Egypt. We are not, however, surprised at the contempt of the French Consul. It is as much as his place is worth to seem otherwise. Much as we esteem Enfantin, he would entirely lose our respect and confidence, if we believed the testimony of this Apostle of condemnation.

A NATIONAL RELIGION.

THE Jews had a model of a National Religion, which is admirably fitted for universality, in one particular respect. They had a national temple, in which no doctrine was taught. All parties could meet in it: Scribes, Pharisees, Sadducees, Herodians, Essenes—all could meet in this one temple. There was nothing to offend them; but each party had its synagogue besides, in which it preached, read, exhorted, and prayed, as it thought proper. The temple was national; the synagogues were sectarian. But the nationality of the temple would have been destroyed by doctrine or dogma, of any sort: it was wisely withheld, and the worshipper was left to his own silent meditations, which might be Sadducean, Pharisean, Mosaic, Platonian, or Pantheistic, as it pleased God to impress his mind. We feel convinced that this Jewish system is the most practical system. Jesus Christ and his Apostles patronized it. We have no authority to say that it was ever diannulled. It is a twofold system, containing, first, a temple for the heart, and the secret thoughts, exclusively; and second, churches or chapels for doctrinal theology. That such a system is not inconsistent with Christianity, is evident, from the fact, that the early Jewish Christians adhered to it, until the destruction of the city and temple. But much additional interest would be given to it, if the fine arts of music, sculpture, and painting, were employed to aid the imagination in its spiritual exercises—if the great outlines of creation were exhibited in pictorial emblems, and the languages of signs and symbols employed to awaken the spirit that lives in all. No controversy could arise in such a church. It would be purely spiritual—spiritual, because it is tongueless, and necessarily confined to the individual's own reflections. It was a sad mistake of the Protestants, who imagined, that by making church service consist of *talking only*, they would spiritualize the service of God. The tongue is the

greatest fomentor of discord that we know of. It might be totally silenced in the House of God. It was a sagacious remark of Mr. Hume, that "the Catholic religion, adapting itself to the senses, and enjoining observances which enter into the common train of life, does at present lay faster hold on the mind than the Reformed, which being chiefly spiritual, resembles more a system of metaphysics." * Hume, no doubt, meant more than is here expressed—he meant that the Catholic ceremonial was more calculated to excite the imagination, and to encourage inward contemplation, whilst the Protestant doctrinism was, on the contrary, productive of metaphysical wrangling, and logical disputation. There is utility in both, and both might, by the above system, be safely encouraged—the national, or silent and ceremonial system, being the Catholic; and the doctrinal, or preaching system, being the Protestant; the first supported by the State, and the latter dependent solely upon the voluntary principle. A man might then very consistently be Catholic and Protestant, voluntary and involuntary, churchman and dissenter, at one and the same time.

* Humes' England, Elizabeth, c. 38.

EDUCATION IN SCOTLAND.

IN a former number we gave an extract from the *Scottish Guardian*, respecting the state of education in the towns and parishes of Lanarkshire, from which it appeared that the voluntary system had done so little for the education of the public, that in large manufacturing towns, where the intelligence of the well-educated is concentrated, the education of the lower classes is most neglected. The following document proves the same thing. When we consider that in Edinburgh and Leith there is a number of endowed schools, called hospitals, such as Heriot's Hospital, Watson's Hospital, the Maiden Hospital, &c., where children are educated, free of all expense to their parents. What a reproach it is to the manufacturing or commercial system of the country, that one in thirteen should attend school in Glasgow, and one in seven in country villages!—

"By the census of 1831, it appears that the population of Edinburgh and Leith was 162,403. By the Education Returns, it appears that in 1834 there were 20,886 attending school. This gives a per centage of 12 8-10ths, or shows that the proportion of the population attending school is as one to 7½. In Glasgow, it will be remembered, that the proportion was as one to 13. The larger rural parishes exhibit a considerable falling off, though even in them the education is not so low as in Lanarkshire. There are nine parishes, with a population varying between 9000 and 2000. These parishes contain an aggregate population of 35,510. Of these there are 3,920 attending school. This gives a population of 11 in 100, or 1 to 9 of the population. When the parishes become smaller, however, the difference is very perceptible. This will appear more distinctly by presenting the results alongside of each other:—

| | Proportion attending School. | |
|--|------------------------------|-----------------------------|
| Edinburgh and Leith,..... | 12 | 8-10 in 100, or 1 in 7½ |
| Parishes whose population varies from 9000 to 2000,..... | 11 | in 100, or 1 in 9 |
| Parishes whose population varies from 2000 to 1000,..... | 13 | 9-10 in 100, or 1 in 7 1-10 |
| Parishes whose population is under 1000,..... | 14 | in 100, or 1 in 7" |

TO CORRESPONDENTS.

Being requested to explain the meaning of an assertion we made respecting the future religion of the Mahometans, and to reconcile it with the rejection of the historical falsehood of the Koran; we reply, that the Koran is Revelation. In this the whole secret lies. No Revelation that we are acquainted with is historical. Revelation has a peculiar language of its own—a mystical language, which employs words almost as much to conceal, as to convey, a meaning. There is an intentional

obscurity about it—its purpose is not to teach any thing that belongs to the sphere of human intellect, such as history, geography, geology, astronomy, chemistry, or any other science. Its sole object is to throw a halo around the mind, through which, in vision, we may see the over-ruling providence of a Power Supreme, and by our own experience and labour, our touching and polishing, at last complete a beau ideal image of that power which shall stand the test of all intellectual criticism, or human philosophy. The rejection of the Koran as a history, therefore, does not imply the rejection of the Koran as a revelation, any more than the rejection of the first chapter of Genesis, as a history, implies a rejection of its divine analogy, or its direct inspiration. In fact, the circumstance of its being an express revelation, would be to us a proof that there was something more in it than a mere external history; that it was an internal, or prophetic, or symbolic history; in fine, any thing but what is vulgarly called a fact, which is the province of human learning, and not of revelation. God is too much the God of order, to interfere with the special vocation of man, by revealing histories. There is no way of obtaining a history but the vulgar way. When the Mahometans arrive at this stage of spiritual discernment, they will throw away the cover of the Koran entirely, and merely regard their prophet in the light of a mystic servant of God, sent to teach the unity of the Godhead, and to reclaim the idolators of the East. In this capacity he will always be respected; but his reputation as a historian is quite another thing. As a prophet we regard Mahomet as a true messenger; as a historian, we regard him as a notorious, but not a wilful liar. The same may be said of the Hindu books. The great superiority of the Bible over all other books of the kind, lies in this, that its historical records are not revelation. If we thought they were, we would not depend upon them. It is chiefly because they are not revelation, but national records, that we do give credit to them; though we consider them, as histories, equally fallible with all other histories, and in many respects contradictory and false, though generally correct. The historical Bible will stand because it is human. The historical Koran will fall, because it is divine; the historical trumpery of the Hindus will also fall; but that peculiar portion of revelation in each, which does not contain a confusion of revelation with human science, will stand; and that portion, we say, will be found to be the same in all,—and future generations, when they have separated the wheat from the chaff, will find, to their astonishment, that the wheat of all religions is the same, and that men were only quarrelling about the chaff.

We have no hesitation in saying that Mahomet was a true prophet of God, and that the historical falsehood of the Koran is no proof to the contrary. Upon this principle, we would not have the slightest objections in a Mahometan country to profess Mahometanism, if we thought, that by that means, "in becoming all things to all men," we could be instrumental in curing their bigotry, and enlarging their conceptions of the universal God. Upon this principle we believe, if we may judge from his doctrines, *Enfantin* has acted; and is, no doubt, engaged in winnowing the wheat, and shovelling the Egyptians the difference between the letter and the spirit. The fruit will appear in time. Such a man is not cast away. He is a Jacob, a Joseph in a strange land.

We wish "Hermes" would not use such ultra-montane, or transmarine words, as "aesthetic:"—still we cannot translate it—"perceptive" is not strong enough. It means something belonging to a sense of the beautiful.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Pantheism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*
"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 5, Vol. III.]

SATURDAY, JULY 29, 1837.

[PRICE 1½d.]

WHAT WILL CHRISTIANITY SANCTION?

Do they themselves, who undertake for hire
The teacher's office, and dispense at large
Their weekly dole of edifying strains,
Attend to their own music?—*Cooper.*

The Scribes and Pharisees sit in Moses' seat. All, therefore, whatsoever they bid you observe, observe and do; but do not ye after their ways, for they say and do not.—*Jesus Christ.*

BECAUSE we oppose the clergy, we do not, therefore, oppose either true religion or virtue. We have no doubt that Jesus Christ himself, were he returning, would rail against the whole fraternity of priests. Religion and priestcraft are two very different things. Neither are we to determine what Christianity will sanction, by what the priests will sanction. The priests are divided in opinion, and more divided in affection; and a house divided is by no means respectable authority.

Were the Pope elected by universal suffrage, and the affairs of the Church conducted by an appeal to the Christian feelings of the Church Universal, we would then not only repeat with respect that part of the creed which says, "*I believe in the holy Catholic (universal) Church,*" but we would also revere the ecclesiastical authority of the Pontiff, and endeavour, through him, as the direct agent of Providence, to effect all the reforms of which the Church stood in need; and these reforms we should ultimately obtain. But the Pope is chosen by a few Cardinals, and these Cardinals are chosen by the Pope!!! and this is the sham Church, which calls itself universal! Were the Catholic Church reconstituted upon the principle of *universal* suffrage, the greater proportion of all the sects in Europe would join it, and make it the most powerful engine of redemption for human society which it is possible for ordinary humanity to construct.

Christianity is the greatest power in the world. United, it is invincible. But how could it be united? By a repeal of all the decrees of Councils, commonly, but falsely, called General Councils, and a commencement, *de novo*, of a universal system. Let every Church remain as it is, hold its own doctrines, and preach and pray as it pleases; but let there be a point of general union, in which all parties, when they had acknowledged a proposition, would agree to co-operate. Let a Pope be the representative of the point agreed upon, and of nothing else. This is a sort of chimera! We are not proposing it as a plan likely to be adopted, but as an illustration of a subject. What, then, we ask, would be the point agreed upon, supposing the churches of Christendom combined to elect a chief by universal suffrage? Would it be a doctrine or article of faith? Would it respect the trinity, election or reprobation, original sin, justification by faith, worship of images, forms of prayers, or any external or intellectual subject? Would it regard even the Scriptures, and the authenticity of the sacred canon? Certainly not; on all these intellectual subjects the Church Universal would be divided. They would all, however, agree on this point, that we ought to do unto others as we would wish them to do unto us. We do not say they would practise it; but they would all subscribe to the proposition.

This, then, would be a starting point to begin with. It would be extremely difficult to proceed any further, but the circumstance of having a central receptacle for universalities would have this happy effect, that as conflicting parties settled down into the sobrieties of a principle of brotherly love, instead of a principle of intellectual wrangling, they would know where they could always co-operate like children of a common parent. This moral duty was regarded by Jesus Christ as the basis of religion, and really, to this day, we cannot discover any other moral foundation of a practical system. Now, what does this moral maxim sanction? It sanctions any system of society which will put an end to poverty, by the distribution of wealth amongst the children of men. It will go to any practical extent of equality.

But this, although a basis, a sort of moral or material basis, would not be enough to constitute the union a Church, or a Christian Church. What more is necessary? Something that all Christians would acknowledge—"Behold, I am with you always, even to the end of the world." "Whatsoever ye bind on earth, shall be bound in heaven; and whatsoever ye loose on earth shall be loosed in heaven." A church so constituted has power to *bind* and to *loose*—to alter and amend—to destroy and to construct. It cannot err, if it work with universal subjects, and refuse to dabble in small matters. If it make all men equal before the law, and give all men equal chance of figuring in life, it does all that men will ever require of it—the quarrels of individuals will never be ascribed to it. The above words of Christ evidently show, that his Church was a progressive Church, not an *articled* Church—not a paper and book Church—but a *living* Church, with the spirit of God in it as the chief agent. Of this truth the Catholics seem to have some faint idea, when they declare that the authority of the Church is greater than the authority of the Bible. This is merely a truism, but yet it is a truism which the Protestants seem to deny. The Bible is merely a book. It has no meaning in itself. The meaning is in the mind that reads it. Whether is greater, the book, or the mind that reads and analyses the book? The book is a dead letter; the mind is a living spirit. The latter, surely, is first in dignity. The book, also, being written for a progressive Church, is susceptible of new meanings as the Church progresses, but these meanings come from the living spirit of the Church; and creeds, and articles, and decrees of Councils, prevent their elicitation. The Church, therefore, is greater than the book, for the Church explains the book; but it does not ~~for~~ the explanation for posterity, like the Council of Trent, and the thirty-nine articles; it only maintains its *binding* and *loosing* rights, and these are indefinite. "*Whatsoever,*" says Christ, "ye bind or loose shall be bound or loosed." What can be more explicit? The power of the Church is indefinite.

But what do we mean by a Church? Not a priesthood, certainly. A priesthood is usurpation—it is in ecclesiastics, what a hereditary aristocracy is in politics. In China and Turkey religion and law are one. There is no priesthood—there are no clergy and laity; but the whole population is both lay and clerical, and Church and State offices being one, are open to all. This is what we mean by a Church; for, if religion be of

any use at all, it ought to be law; and if law have any virtue in it, it ought to be religion. Moreover, as we do not regard a law to be sacred or binding, which is not the expression of the will of the people, so we do not believe a religious system a Church, unless it be equally universal in its constitution. The reason why the Church at present is less popular than the State, is merely this, that the people have less to do with it. Introduce the popular will into the government of the Church,—in its *binding and loosing* capacity, as ordained by Christ—and it becomes a popular, a favourite institution once more. Indeed, it is the final resting-place of the public mind. The mere State will deceive the people. They will never redeem themselves by politics. It is a Church, and a Church only, that can bring salvation. And what is the difference between a Church ruling a State, and a State ruling a Church? The difference is very important. The Church, with all its imperfections, is the representative of fraternity and love—of the feelings and the affections of the heart; the State is merely the representative of trade and commerce. Were the Church popularized, it would be intensely interesting. It would take up, in an especial manner, all those topics which peculiarly affect the people, such as the condition of the poor—the education of children—the improvement of morals, &c., which mere politicians seem to regard as of minor importance. But it would be better to convert the State into a Church, than to call a convocation of the clergy, for this would be dividing what ought to be single. But how can the State be converted into a Church? It will grow into a Church *by vocation*, having found political wrangling useless, and legislation endless, lawmakers will return at last to the only basis of a sound social system, that of doing to others as they would be done by; and binding and loosing both gospel and law, as seems most conducive to the happiness of the people. Politics will then cease; for, whenever legislators adopt the basis of Christianity as a principle of action, and carry it out with spirit to its extreme consequences, it is all over with political wrangling. The State is then a Church, and the Church a State, for ever.

But what will ye do with those who believe in the operation of the Holy Spirit upon their souls, and make it an especial guide in the affairs of life? They are much easier to deal with than those who stick to the thirty-nine articles. The former have a living witness within them, that you may reason with; the latter have a dead letter, a cold lifeless corpse as their director, which is insensible to persuasion. *Practically*, this Holy Spirit is just reason itself. The Quakers profess, in a particular manner, to be under its influence. They are only partially so, however. They have their creeds and articles of faith like the Church, and, with all their pretensions to the Spirit, their chief rest and confidence is in the letter. But a revival of Quakerism has lately taken place, to a very *alarming* extent, under the inspiring zeal and eloquence of Elias Hicks, who has been converting the Quakers by thousands (in the United States), from the letter to the spirit of the Word. Isaac Crewdson begins his refutation of this heresy, by saying, "In contemplating that desolating heresy, which, in the United States of America, has lately swept thousands after thousands of our small section of the Christian Church into the gulf of Hicksism and Deism, a heresy, which, in proportion to our numbers, is probably unparalleled in extent in the history of the Church of Christ, it may be useful to bring before the view of our Society, in this country, the errors that have led to such fatal results." What errors are those? Merely the first principles of Quakerism itself, that the spirit is superior to the letter.

We shall examine a few of those fatal errors. The following is one of the extracts given by Isaac Crewdson himself, to show into what a gulf of perdition the Hicksites have fallen, by preferring the spirit to the letter. We extract it from the *Beacon*, and the *Beacon* extracted it from "*The Quaker*," the official organ of the Hicksites in America:—"When we speak to the natives (Indians) of our country, we have reason to suppose that they have a *higher sense* of this divine light in the soul than the professors of Christianity generally have. They *appeal* to it in all cases respecting the soul. They appeal to it abundantly, as I have witnessed among those with whom I have had converse; especially those who have never had inter-

course with any except their own nation. The religion of Christ and the gospel is *one* in all the nations of the earth; and I have no doubt, that there are those in every nation of the earth who have the religion of Jesus, and that they are saved by it, and by nothing else."—P. 6. Crewdson calls this an insidious doctrine; yet nothing can be more Scriptural and more *Quakeral*. The preaching of the gospel to the heathen is not the communication to them of that which is not within them, but a deliverance of the simple truth from the rubbish of superstition with which it is surrounded. You do not require to plant true religion, God himself has planted it, and left man merely to weed the ground, and cherish the tender nursing. The following is another specimen of Elias:—"Some will set up a particular system, and tell much about *old things*, the prophets under the law, and about Jesus Christ in that outward body, asserting that his death made atonement for our sins. What astonishing ignorance it must be, to suppose that material blood, made of the dust of the earth, can be considered a satisfactory offering for a spiritual being, that is, all spirit and no flesh! I say, what astonishing ignorance!" He advises men to turn to the light within them, without which the Bible is a sealed book, and becomes a curse to them. "I do not undervalue the Scriptures, but I feel it a duty to set them in their right place, and I dare not set them above it."

We have alluded to the Hicksites only for the purpose of showing how far Christianity can go, how susceptible it is of polish, how consistently, even with itself, it may be divested even of that which, among its outward lip-disciples, is considered its very essence. Here is a sect of pious Christians, who are so far from suffering themselves to be guided by the text of Scripture, that they consider themselves as the judges, the superiors of Scripture, by virtue of the living spirit within, which is greater in authority than the dead letter without. This is the true Catholic spirit, and this spirit is sufficient to save the world, if the Church be reconstituted upon the principle of its supremacy—Otherwise there is no hope. But it is curious and interesting to perceive how Rationalism on the one hand, and Spiritualism on the other, are evidently tending to the very same centre, namely, the recognition of the authority of the living church. This spiritual Catholicism of Hicks, is practically the same as Owenism, i.e., the two parties might agree in practice, for they both follow the light within. The truth is, they are both following the spirit, but the one party follows it with a consciousness of its divinity, the other of its humanity only; the one seeks it socially, the other individually.

But these two opposite parties are better Christians than the "*letter*" Christians of the Churches and Chapels. The Owenites seek to establish a social system, founded upon the moral basis of Christianity, as given by Christ himself, and the Hicksites endeavour to establish a Church upon the faith of the promise of Christ to his followers, "Behold I am with you always, even to the end of the world;" "whatsoever ye bind or loose, shall be bound or loosed."

We consider that these two parties united would make a Christian Church, for the one has divine authority which is an essential ingredient, and the other has a political organization, calculated to promote Christian morality. The two bases with which we set out are indispensable, and these two, which belong to Christianity itself, and form its very essence, will sanction the following constitution of a system:—

1. The Church universal, represented by an individual, selected for the office by the general will, and possessing, in that capacity, divine authority, in every thing he does, by the expressed or tacit consent of the church.

2. A social system of production and distribution of wealth, founded upon the Christian principle of doing to others as we would wish them to do unto us in similar circumstances.

This is all that is necessary. Christianity will not only sanction it, but it demands it, and *foretells* its accomplishment; indeed, Christianity is nothing but Babylon, the city of confusion, until this consummation be effected. All who know any thing at all about the Christian religion, know this universally acknowledged fact, that a time of Apostasy precedes the final establishment of the Gospel. During that time of Apostasy the true Christian cannot be a politician, for the kingdom of Christ

is not of this old world; but it is distinctly stated that a time *shall come* when "the kingdoms of this world shall become the kingdom of our God, and of his Christ." When such a period arrives, Christianity will be political. There is therefore a provision for political economy in the gospel of Christ. This provision we have discovered in the two fundamental principles revealed.

But cannot we do with one only—namely, the moral? What is the use of the divine authority? The use is very manifold, but there is one particular use, which may be more intelligible to those who dispute the necessity of such authority, than any other argument, and that is the authoritative suppression of all religious fanaticism, which would otherwise spring up like weeds in the social system, in spite of any pretended rationalism supposed to be created by science and circumstances. Wherever there is a want experienced, Nature rudely supplies it. Nature and Art together supply the want, better than Nature alone. Art, therefore, must be associated with Nature in the ecclesiastical constitution of a social system, if that system be a practical and permanent system; and the authority of a universal system is so supereminent, that opposition of individuals would act upon it, merely like gnats on the hide of a rhinoceros.

The greatest difficulty to be experienced in the constitution of a social system, is the marriage question. We do not pretend to be able to settle this any more than any other disputed point. All we maintain, is this, that the Christian Church has a right to bind and loose at pleasure, and put any meaning it pleases upon the law and the gospel, only, let it do it *for love*. They much mistake the nature of the Christian religion, who suppose that it *necessarily* enslaves. Its corruption enslaves, but the genuine gospel is the full liberty of the heir and the free-born, when he has come to his inheritance. It is the end of the outward law, being the law of the mind and the affections. It is susceptible of being refined even to the entire abolition of laws and magistrates of every kind. In this respect, it is more susceptible than man himself. It is not from Christianity that any difficulty proceeds in re-organizing society and re-modifying its habits and customs, it is from men and women only. If benevolence be the motive, and increased happiness the object, you have the authority of Christianity for whatever you do. *Having this authority, use it.*

PLATO'S REPUBLIC, OR SOCIAL SYSTEM.

No. II.

THE reader must exercise his own imagination with regard to the nature of the moral and intellectual education recommended by Plato. It consists first of piety towards the gods as models of moral excellence, authors of good, and not of evil—lessons of moral rectitude in respect to the social intercourse of life,—and mental and bodily exercises for imparting vigour to the twofold nature of man.

This education being pre-supposed, we shall endeavour to represent, as clearly and briefly as possible, the establishment of a society, founded upon the triple basis of the governing, the auxiliary, and the mercenary, classes.

The governors and auxiliaries are to be selected upon the pure aristocratic principle,* and compelled to govern, willing or unwilling; the latter is preferable. "Every city," says Socrates, "in which the governors are averse to undertake government, will, of necessity, be best established, and most free from sedition; the love of power is, therefore, to be discouraged, not by education only, which, being merely theoretical, is not sufficient security for the practical realization of the principle; but a political contrivance is also employed to reduce the love of power to a level with the love of obedience, so that the latter shall be quite as acceptable to the governed, as the for-

mer to the governors. The governors are doomed to poverty. They alone shall not touch gold or silver; they shall neither drink out of them, nor suffer them to be in their houses. They shall merely have enough; they shall be kept like watch-dogs, to watch the community, and shall become the servants of those who obey them. They shall not be free to travel, or feast, or wanton; but shall be used for the good of the State—not the State for them. Community shall begin with them, and be most perfect amongst them. "Let none possess any substance privately, unless there be the greatest necessity for it. Let none have any dwelling, or storehouse, into which, whoever inclines, may not enter; as for necessities, let them be such as temperate and brave warriors may require; and as they are appointed by the other citizens, let them receive such a reward of their guardianship as to have neither overplus nor deficiency at the year's end. Let them have public meals, as in encampments, and live in common. They must be told they have a *divine* gold and silver in their souls, and have no need of the human"—(? material).

The reader must here recal to mind the threefold division of the human soul, viz.—Reason, Anger, and Desire. These guardians, or governors, correspond to the two first, which are both ruling principles. Reason is the root of Wisdom; Anger, of Fortitude. Anger is regarded by Socrates as the soldier of the mind. It is the spirit of offence to evil, and of defence for good. If often misdirected, it is because it is corrupted and misinformed, not because it is essentially bad as an elementary principle of our nature. Its informer and legislator is reason. Reason, in a well governed mind, dictates to anger, and anger fights for reason. There is so much intellectual affinity between the two, that Plato makes both governors. Hence the auxiliaries rise to the governorship, when the fire or fighting principle of youth is quenched by age and sobriety. Fifty is the age for a senator or legislator, when an auxiliary may rise to the first rank, and put on the beard of wisdom, and the look of experience.

With regard to the third, or mercenary division, the social system of Socrates is somewhat obscure. The community is evidently meant to be less perfect in this division. It admits of every variety of trade and commerce which abounds in the present system of society. Merchants—money—shopkeepers—hirelings; and yet a species of community is to be observed in it; that community, however, we suspect is to be under the control of the governors, whose duty it is to determine what amount of private property may be safely intrusted to individuals. Moreover, the mode of life, as we shall perceive when we come to speak of marriages, is such as to moderate the desire of wealth for *selfish* purposes, to such a degree as almost to destroy it, whilst provision is made by public honours, civic crowns, and other tokens of approbation, for giving encouragement to every species of energy which is calculated to add to the wealth, or promote the happiness of the entire community. This third class, however, is the most free of all in respect to the use of wealth and money. In respect to *authority* it is least free. The balance of freedom is meant to be as fair as possible.

This third class, like desire, its prototype, is a many headed, reckless monster. It forms the great mass of the people; it is, therefore, the principle subject to be dealt with, the clay to be fashioned into the image of virtue. Hitherto, that clay has been too dry, it has been dust, scattered by the blasts of prejudice and ignorance, impatient of control, and the sport of insubordination. Whose is the master mind that shall infuse the principle of attraction, and cause the various parts to adhere, and form a healthy and innocent system? The system of Socrates is very simple; namely, to put every man in his proper place. This is theoretically perfect; but, like the laws of our blessed country, of which Blackstone says, that in principle they are almost perfect—the practice, we fear, will belie the excellence of the theory. Socrates admits the difficulty, and even talks of the possibility of his republic being dissolved by sedition and herey, after it has been established, and working well for many generations; but still the great master of reasoning is not at a loss for schemes by which the difficulties are to be surmounted.

* Aristocracy among the Greeks had a meaning very different to what it now conveys to the public mind. It meant the *government of the best*—i. e., a government in which the best men bore rule; not the richest, nor the most noble in birth, but the most excellent in wisdom and virtue. *Aristos* is Greek for *best*. Plato's republic is, therefore, an aristocracy in the pure sense of the word.

The main-spring of the whole scheme lies in the marriage system. This, indeed, is the pivot upon which the whole political question of a social and anti-social system must turn—"Whether should mankind be one family or many families?" that is the question to be discussed. We are now treading upon delicate ground, and subjecting ourselves to the reproach of the fastidious, the prejudiced, the mock-modest, and all the other nameless and indescribable classes of antisocialists throughout the world. But we have this consolation accompanying the performance of our task, that we are not giving our own opinions, but merely transcribing the opinions of the divine Plato and Socrates, men whom the combined host of saints, Papist and Protestant, orthodox and heterodox, have agreed to regard with the most unaffected reverence. They were truly pious and devout men, removed, as far as the best of men can be removed, from every sensual and degenerate principle of action, and influenced by no other motive than the good of mankind, they expressed the unadulterated feelings of the heart, in language too elegant to be despised, and too chaste to proceed from minds impure. We associate Socrates with Plato, in the invention of this social system, because we believe that when Plato dramatizes Socrates, he does not misrepresent the opinions of his master, nor belie the philosophy for which he was renowned. If the language, and the ideas, and the arrangement be Plato's, they are sanctioned by Socrates. They are supposed to be such as the shade of Socrates would approve of. The mantle of the great dialectic philosopher fell upon Plato. He is merely the amanuensis of Socrates. He has an original genius of his own, and that, too, of a very exalted order; but his genius adored the superior genius of the prince of moralists; and his conscience was too chaste to identify, when dead, his name and character with opinions to which, in life, he would not willingly have subscribed.

Let us now treat of women, therefore. Women, according to the Platonic system, are to receive the same education as men, and to be eligible to the same employments; to act as legislators, guardians or soldiers, magistrates; in fine, to do whatever their genius seems to fit them for. But, it being very evident that Nature has originally constituted the female sex weaker than the male, we are informed that experience will teach the propriety of allotting to them employments of an easier nature than those which are given to the harder sex. The reasoning by which this, as well as all other maxims of the republic is demonstrated, is very acute and ingenious, but our readers must endeavour to conjure it up in their own imaginations, as we have not time to enter into the details of each of the elaborate demonstrations, which occupy in all ten books, and form a volume of considerable size.

The best men are to be appointed to the best women, and the most degenerate men to the most degenerate women; and thus two races, one of peculiar excellence, and another of peculiar degeneracy, are to be continued, as an essential feature of the social system, which requires superior minds to rule, and inferior minds to obey. This species of policy was familiar to the ancient philosophers. It is somewhat revolting to modern feelings, though secretly practised by all that can attain to it. But the moderns employ the superiority of *caste*, to obtain superiority of wealth—the system of Plato is merely the reverse.

At stated periods, determined by the *prudence* of the governors, there are to be public festivals, called marriages, appointed solely for the state purpose of the continuation of the species. These marriages are to be preceded and accompanied by prayer and sacrifice, and all the ceremonials of religion. On these occasions the governors are to contrive to match the sexes in such a way, as that the best shall associate with the best, and even in cases where the ballot* is employed, it must be so con-

trived, that the *depraved* shall accuse his own fortune only, and not the governors. These festivals are to be given to men between thirty and fifty-five, and women between twenty and forty; and no two shall ever have permission to hold sexual communion at any other time, without the permission of a magistrate! The frequency of these marriages, and the amount of reproduction, are to be determined by the Malthusian principle of making population keep pace with the means of subsistence. To those who distinguish themselves in any honourable employment, the most ample liberty of sexual intercourse is to be given, that, under this pretext, the offspring of the best may be the more numerous. *Love* is a civic reward. The children of such are begotten at the state marriages to be accounted legitimate children, the loves of the parties legitimate loves; all other children and loves, not sanctioned by law, to be esteemed bastards and adulteries. Bastardy and adultery become thereby crimes against the state. Such children, and the children of the depraved, are to be "hidden in some secret place as is proper;" destroyed, we suppose, like Achan and his children, as unholy, as the Lord commanded Joshua. This was the policy of ancient times.

After the time of child-bearing, there is no official notice taken of women, except that they shall not associate with fathers or sons. All are to be accounted fathers, who might be fathers by age; and all men twenty years younger than themselves are to be accounted sons. Upon the same principle, a woman thirty years younger than a man is to be accounted his daughter. Intercourse between such is forbidden as incestuous. The spirit of the moral law is thus preserved, but the meaning of the text is altered; it is *translated* into another system of society.

(To be continued.)

AN AFFAIR OF HONOUR; ALIAS, A DUEL IN RHYME.

THE following little poetical note, signed PATER PATRIE, is evidently ironical. It is also clever. The sarcasm is delicately expressed—for this reason we forgive the misunderstanding of the writer, supposing it to be original, and personally addressed to ourselves. The author seems to be opposed to our notions of government, and thinks proper to identify a paternal with a military and tyrannical government, to give a sharper point to his sarcasm. It is very probable, that the difference between us is more in words than in things. Language is, unfortunately, in such a state at present, that that which seems plainest to the common mind, is most unintelligible when analyzed. We certainly never meant to advocate any other species of government but that which was in unison with the general will of the governed, and consequently, Neros, Napoleons, or Robespierres, have nothing whatever to do with our opinions. So far as they were popular, they were legitimate: but "Father of his Country" is a cant phrase, which is very defective, inasmuch as the true and legitimate ruler of his country is as much a son as a father; he is not only a son of the soil, but he is a son of the public mind. A man cannot form the mind of the age, but the mind of the age can form the man. The "chosen of the people" is the son of the people, and is, we believe, the true meaning of "the Son of Man," who is the only legitimate governor. All other governors are usurpers. We have written a short impromptu reply to the epistle, which, if not poetry, is at least rhyme, and embodies the above sentiments. If we have mistaken Pater Patrie, we hope he will forgive us, as we heartily forgive him for his misunderstanding of our sentiments:—

NERO TO SENECA.

A LETTER TOUCHING PATERNAL GOVERNMENT.

Wisely the living do the work of death,
In killing mortal men.—*A sentiment of Socrates.*
I think the Romans call it STOICISM.—*Addison's Cato.*

The August Emperor greets
His master in philosophy—
Nero of Seneca entreats

That he would die.

* We suspect that if Plato and Socrates had passed a few months amongst our modern Radicals before they invented this curious system of ballot, they would have stumbled over it. The mob of Plato's republic must be fools indeed, if they could be wheedled into such a confidence as this in governors who deceived them in love affairs, which even inspire fools with genius. We suspect the governors themselves would be more frequently deceived than the governed.

The laws, the axes, and the rods,
Now serve no tender-hearted boy :
He sits a god among the gods,
And bids thee die.

Too long thy bootless words he heard ;
Thy pride of spirit soar'd too high :
Cato and Brutus have concurr'd
That thou shouldst die.

Not always be a babbler vain—
Convert thy teaching—prove to th' eye
Thou art, indeed, the worthy man—
Teach men to die.

As one sang o'er the burning city,
So will he dissipate on high
Thy smoke of conscience—without pity
Dissolve and die.

When she who bred him—she who would
Bring Love's young brood to view the sky—
When *these* lie murder'd in cold blood,*
Wilt thou not die ?

Those who have trodden out the soul
Look in the dark for sympathy.
Down—scribbling slave! full is thy scroll—
Depart and die.

Time shall not clothe thee with the shame
That thou didst make philosophy
The pander to a tyrant's fame:
Then calmly die.

PATER PATRIÆ.

* Alluding to the deaths of his mother and of his wife.

SENECA TO NERO IN REPLY.

A LETTER TOUCHING FILIAL GOVERNMENT.

When death speaks from the Tomb, it gives life to the living.
—A sentiment of Plato.

Reputation! Reputation! Reputation! Oh! I've lost
my reputation!—*Cassio in Othello.*

Canst thou beget a people's mind ?
Mould it like potters' clay ?
When thou say'st "loose," do men unbind ?
O Pater Patriæ!

Is it with fear, or heart and will,
Thy slaves do thee obey,
When they thy rude commands fulfil ?
O Pater Patriæ!

Pater shall never judge the earth—
The Son shall bear the sway—
The Public Faith must give him birth—
The Filius Patriæ.

The People's *wants* beget the Son,
On whom their faith shall stay,
He Father is, the anointed one,
Sole Pater Patriæ.

I die, I die; from such as thee
I calmly steer away :
But, even in life, I hope to see
Fil-Pater Patriæ.

SENECA.

DIVISIBILITY OF MATTER.

THE following extract is taken from the second volume of Dr. Millingen's new work, "Curiosities of Medical Experience." The passage is intended by him to illustrate the principles of the homœopaths, in their infinitesimal doses. The experi-

ments detailed, also show us the difficulty of drawing any radical distinction between what we call matter and spirit, or power; because a visible particle may be divided and subdivided till it becomes invisible and imponderable; and must then, to our senses at least, possess all the attributes of spirit. Matter and spirit, then, are probably but the same thing, after all—the two extremes of one indefinable essence.

"What appears to our feeble organs an atomic fraction, may produce phenomena on the organism which we cannot comprehend, but should not, therefore, be denied. Let one grain of iodine be dissolved in one thousand five hundred and sixty grains of water, the solution will be limpid; let two grains of starch be dissolved in two ounces of water, and added to the first solution, and the liquor will forthwith assume a blue tint. In this experiment, the grain of iodine has been divided into 1-15360. Dissolve the four hundredth part of one grain of arsenic in four hundred thousand parts of water, and the hydric-sulphate will bring it into evidence. Let a five thousandth part of arseniate of ammonia be dissolved in five hundred thousand parts of water, and the addition of the smallest proportion of nitrate of silver will obtain a yellow precipitate. Numerous experiments of a similar nature may be daily resorted to, to prove that the most minute particles of two substances, possessed of chemical affinities, may be brought into action, although diluted *ad infinitum*. But the power that the smallest particle possesses in producing natural phenomena cannot be more evidently proved than by Spallanzani's experiments in fecundation. This physiologist having wrapped up a male frog in oiled silk, fecundation could not take place; but having collected on the point of a camel-hair pencil a particle of the fecundising fluid, he succeeded in vivifying thousands of eggs. Surprised at this result, he dissolved three grains of the secretion in a pound of water, and one globule of the solution was endowed with the same faculty. In this case the globule of water only contained 1-2,994,687,500th part of a grain. This curious experiment has been tried, with a similar result, by Prevost and Dumas. How imponderable and impalpable must be the effluvium which enables the dog to track his master for miles!—the particle of attar of roses, that perfumes a whole chest of clothes!—and what must the power of the aroma be, which is preserved for thousands of years in some Egyptian mummies! Would the vulgar believe in the wonders of the solar and gaseous microscopes, unless they were exposed to view? where we behold, in amazement, myriads of individuals in one drop of fluid, each of them as perfect in organization as could have been the mighty mammoth of old, or the sagacious elephant of our days, endowed with distinct habits, destructive and reproductive propensities and faculties."

THE TRANSCENDENTALIST'S DIALOGUES.

No. IV.

ON "THE ONE"—(Continued from p. 27.)

Transcendentalist—Materialist.

Trans.—At the conclusion of our last dialogue, you resolved to search for the pure one in pure space; now, to prevent loss of time, I tell you at once that your search will be useless; space is infinitely divisible, that is, divisible to such an extent, that whatever "one" you arrive at, that "one" is resolvable into a many. Time is also infinitely divisible, and you can never come to an indivisible moment, which you can call a pure "one."

Mat.—Then must we give up our search altogether? If we can neither find the one in space or time, nor in the things which are in space and time, where the deuce are we to look? There is nothing left, in which to search.

Trans.—Nothing left? Are you quite sure there is nothing? If all these tables and chairs, and these walls, were removed, would there be nothing remaining besides empty space?

Mat.—Nothing but ourselves.

Trans.—And have we searched ourselves for the "one."

Mat.—No.

Trans.—Then still our task is unfinished, and I rather expect we shall be more successful on this occasion than we have

been hitherto. One point we have arrived at, and that is, that we must not search for the "one" in the things connected, but in that which connects them. I did not tell you so at the time, but it was very senseless to look at pure space as the bond that connects various bodies,—things are connected in space; but why you for a moment imagined that space connected them, I cannot conceive.

Mat.—No; I confess it was absurd enough. But I was carried on by the discussion to search everywhere possible. Of course, space holds nothing together; it is the mere place in which they are held by some other power.

Trans.—And now let us labour hard to get an exhausting conception of the "one." By an exhausting (*erschöpfend*, German) conception, I mean one which should embrace every possible signification of the "one." Thus, "one prospect" merely applies to the "one" in space,—"one hour" to the "one" in time. Now let us try to find out what it is that constitutes "oneness," wherever the *one* may be; and whether there is not something common to *one* hour, and *one* yard, which constitutes the oneness of both.

Mat.—Now, methinks, we are going the right way to work; for if, after a troublesome investigation, we had discovered what constituted *one* yard, *one* square foot, *one* prospect, and so on, we might have been quite at a loss to know what constituted *one* hour, *one* day, &c., and therefore, though we might have been marvellously enlightened as to the constitution of a particular kind of *one*, we should have been quite in the dark with respect to the constitution of the "one" in general.

Trans.—And now let us begin with the most general "one" in space, namely, *one* prospect. Look out of my window, at the various houses, trees, passengers, and so on, and tell me, if you call the motley scene *one* prospect.

Mat.—Assuredly.

Trans.—When you say that these houses, &c., form *one* prospect, you do not mean that there is any very intimate connection between them; that is, you do not suppose that the existence of yonder red house, depends on the existence of yonder hollow tree?

Mat.—Certainly not.

Trans.—Now tell me.—Do you observe a man looking out of the window of yonder white cottage?

Mat.—I do.

Trans.—That man can perfectly see the red house, but the hollow tree is concealed from him. Now, there is *one* prospect before his eyes; but that *one* prospect is not formed of the same objects as yours. Thus, the combination of the house and the tree partly constitute *your* prospect, but not *his*; as to him, they are not combined at all. To you a combination of one set of objects forms *one* prospect; to him a combination of another set. And you say that there is really no intimate connection between the things themselves; therefore, I think we may say, that they're being *one* prospect solely depends on somebody being here to look at them.

Mat.—That seems clear enough; a prospect is only a prospect while it is looked at. Indeed, I think we have been rather guilty of tautology while speaking of *one* prospect—the word prospect in itself meaning *one* extensive combination of various things present to the eye.

Trans.—But do you believe that if nobody was here, that house and that tree would still stand at the same distance from each other?

Mat.—Of course they would! The houses and trees stand in certain relative positions whether we are here or not; what depends on us, is merely whether these or those shall be included in *one* prospect. As, for instance, if I were a painter, I might merely delineate all I saw through this pane of glass, and call that a landscape; or I might add what I saw through this other pane, and it would still be a landscape, though of a larger extent. Now, this including of more or less in one view, or even shifting my quarters, and taking in different objects, depends wholly on myself, but that is all.

Trans.—Well, then, do you suppose, that if there were not a single perceiving being in the world, that tree would still be a mile from that red house.

Mat.—Certainly.—What has a man's looking on to do with

the real existence of a house or tree; or of the length of ground which divides them.

Trans.—I now understand you. Even supposing there were not a soul in the world, that distance would still be *one* mile.

Mat.—Yes; no doubt. But, understand me, the English mile is an English measure; and, of course, the use of such a measure depends on the existence of Englishmen. Therefore, mark, when I say it would be a mile, I merely mean that its length would be the same as it is now. Do not entrap me on account of my use of this word.

Trans.—Certainly not. The distance it appears is *one* mile, and as that occupies a portion of the length of space, must we admit that another mile begins after that.

Mat.—Oh, certainly, and another—and another—and another—till we have performed the circumference of the world.

Trans.—I see; you mean that there is a circle drawn round the world, the circle being larger or smaller, according as it cuts the equator or not, and that what we call *one* mile is a portion of such a circle.

Mat.—Of course.

Trans.—That, in fact, the mile before us is a portion of some circle, being divided from the remaining portion at the points where the house and tree stand. But now I would ask one question, what divides the circle?

Mat.—The house and the tree to be sure.

Trans.—We will see. Let us start from the trunk of the tree, and trace the line to the front of the house. Is the house of any width at all?

Mat.—Yes, the width of the house is measured by a line drawn from the front to the back.

Trans.—Which begins at the end of the other line. Then, in fact, a line drawn from the trunk of the tree to the front of the house, may be continued uninterruptedly all round the world to the very point whence we started?

Mat.—Of course. The line is never broken.

Trans.—Then how can it be said to be divided?

Mat.—That is a frivolous question! Look here; I draw a line on this slate, I now draw another across it; the first line goes on continuously and yet is divided at the point of intersection.

Trans.—My good friend, I know that this happens while we are here looking at the lines, and I know that the house and tree divide a long line, while we contemplate them, but recollect that we are talking of a case where there are no perceivers whatever. No ocular demonstration is available, as in that case we are perceivers. I, as an active being, start from the trunk (I am now supposing myself as taking a walk). I pass through a variety of objects. I stop at the house, and collecting in my mind, the number of objects I have passed through, and comparing them with time, &c., I say they occupied the distance of a mile. That I, an active being, can start from a point and stop at a point, I can understand; that I can sum up two or three objects, and stop before I arrive at the fourth; but what creates a division in a line, where there is no perceptive to say, here I stop and go no farther; this I say is to me wholly unintelligible.

Mat.—I will reflect on this. But I say, what has all this to do with the "One?"

Trans.—An immense deal. The *one* is an almost inexhaustible subject. We shall go on still heading our dialogues with this title, and depend upon it that often as we may seem to wander from our text, the *one* will pop up its head every now and then, and tell us that it alone is the actual subject of our discussion.

GOETHE'S OPINION OF THE STATE OF SCIENCE.

OUR scientific men are rather too fond of details. They count out to us the whole consistency of the earth in separate lots, and are so happy as to have a different name for every lot. That is argil; that is quartz; that is this, and this is that. But what am I the better if I am ever so perfect in all these names? What am I the better for these lots? what for their names? I want to know what it is that impels every several

portion of the universe to seek out some other portion—either to rule or to obey it—and qualifies some for the one part, and some for the other, according to a law innate in them all, and operating like a voluntary choice. But this is precisely the point upon which the most perfect and universal silence prevails.

Every thing in science is become too much divided into compartments. In our professors' chairs the several provinces are violently and arbitrarily severed and allotted to half-yearly courses of lectures, according to fixed plans. The number of real discoveries is small, especially when one views them consecutively through a few centuries. Most of what these people are so busy about, is mere repetition of what has been said by this or that celebrated predecessor. Such a thing as independent original knowledge is hardly thought of. Young men are driven in flocks into lecture rooms, and are crammed, for want of any real nutriment, with quotations and words. The insight which is wanting to the teacher, the learner is to get from himself as he may. No great wisdom or acuteness is necessary to perceive that this is an entirely mistaken path.—*Mrs. Austin's Characteristics of Goethe.*

A SNAKE IN THE GRASS.

THE following passage, from the *Christian Remembrancer*, is somewhat more Catholic in its spirit than is usual with Protestant divines. Our readers must be aware that the chief point of controversy between Catholics and Protestants, respecting the circulation of the Bible, is the comparative weight of the authorities of the Bible and the Church. The Catholics maintain the superior authority of the Church or the living Word. The Protestants maintain the superior authority of the Bible, or the dead letter. Hence the Catholics, from principle, object to the circulation of the Bible among heathens, unless accompanied by the commentaries of the Church regnant. The Protestants would send it as naked as it was born. The Catholics, however, prefer *viva voce* instruction, and the use of sensible signs, and that Nature prefers this latter method, is evident from its success; but the Protestants regard Nature as God's enemy, in other words, the devil, except when she becomes an auxiliary to them and their orthodoxy:—

"We cannot but regard the idea of converting nations by the Bible, without note or comment," says the *Christian Remembrancer*, "to be an egregious mistake, proved so to be, not only by the evident failure of the scheme, but by the testimony of that very Bible which is affirmed to be the instrument of conversion. Moses did not write his Pentateuch, and then advance to the conversion of his countrymen, book in hand. The Old Testament arose gradually; nor was its canon complete till the Jewish mind had been abundantly trained for its profitable study. Not one book of the New Testament was written for unconverted nations. The Bible, therefore, is its own witness that it was not intended as the preliminary instrument in their conversion. Its truths were communicated by the Apostles to the Heathens, not all at once, but singly, and as they were able to bear. There was also strong meat for nativity; but there was milk for infancy. There is a spiritual, as well as natural plethora, which is not less fatal in its tendency. Put Euclid and Newton, without note or comment, into the hands of a peasant, and tell him to discover the system of the heavens, and you will have some idea of the proficiency which a Heathen will make in Christian knowledge with a Bible, similarly circumstanced. The idea, therefore, of converting the Heathen by Bibles, without note or comment, is unwarrantable, both by experience and Scripture. We are not aware that the Bible Society has produced one instance of a convert, who had never heard of Christianity, except through Bible without note or comment, of any description whatsoever."

There are only two ways of converting nations. 1st, By the word, as Mahomet converted the Arabs, and the Knights Templar, the Poles. 2nd, By political interest, a specimen of which method we have in the conversion of the South Sea Islanders, who were led as a people, *en masse*, to embrace Christianity, because they perceived that the Christians had large ships and

fine clothes, and could accomplish many wonderful things, for which the islanders were not competent. They, therefore, quarrelled with their own gods, flogged them well, and discharged them. Were this latter mode of conversion systematically pursued, and the conversion of whole nations attempted by a *coup de main*, we might occasionally hear of some remarkable changes in the Heathen world; but this miserable petty Protestant system of proselytizing individuals, and these, too, of the lowest order, is more calculated to excite hostility against Christianity, in many countries, than to further its progress.

NUMBER OF INSECTS.

In the Royal Entomological Cabinet of Berlin, there are twenty-eight thousand species of beetles, and from the presumed superiority, in point of extent, of the Coleopterous order, Burmester assumes that the actually known amount of insect species, and their relative proportions of number, in the different orders, may thus be distributed in round figures:—

| | |
|-------------------|--------|
| Coleoptera | 36,000 |
| Lepidoptera | 12,000 |
| Hymenoptera | 12,000 |
| Diptera | 10,000 |
| Hemiptera | 4,000 |
| Varia | 4,000 |
| | <hr/> |
| | 78,000 |

Stephens, with his usual accuracy, establishes the following numbers of each of the orders, as regards *British* species of insects: they must, however, be considerably increased by the addition of many minute Hymenoptera and Diptera, noticed since the publication of his catalogue:—

| | |
|-------------------|-------|
| Coleoptera | 3,300 |
| Lepidoptera | 1,838 |
| Hymenoptera | 2,054 |
| Diptera | 1,671 |
| Hemiptera | 605 |
| Varia | 544 |

IMPRISONMENT OF NAMES.—One of the choicest tricks of the law we have heard of, is that by which a man's body is liberated whilst his *name* only is incarcerated for the offence. This is at present frequently practised at the Havannah. A slave-ship captain is judicially sentenced to prison for trading in human flesh. He purchases his liberty from his judges, upon condition that he appear in society under a new name until the term of his imprisonment has expired. Thus Captain Cannibal is condemned by the worthy judge to one year's imprisonment for stealing and selling his fellow-men. Captain C., in private, compromises the matter, and for a small consideration, it is agreed that the name of Captain Cannibal alone shall remain in prison for the time specified. The person lately called Captain Cannibal, therefore, assumes a new name, such as Captain Maneater, and is known in society for twelve months by the latter cognomen. If any one asks for Captain Cannibal at his own domicile, "he is not at home: he is in prison;" but if any one asks for Captain Maneater, he finds Captain Cannibal. The Jesuits, no doubt, invented this trick!

A HINT TO THE BLIND.—Thomas Aquinas, being closeted with Innocent IV., when an officer, brought in a large sum of money, produced by the sale of absolutions and indulgences, "You see, young man," said the Pope, "that the age of the Church is past, in which she said, 'Silver and gold have I none.'" "True, holy father;" replied Aquinas, "but the age is also past, in which she could say to a paralytic, 'Rise up and walk.'"—The English clergy may find a very good moral in this story.

DESPOTISM AND DEMOCRACY.—(From *E. L. Bulwer's Athens*).—And as I have elsewhere remarked, it is indeed the nature and prerogative of free states to concentrate the popular will into something of the unity of despotism, by producing, one after another, a series of representatives of the wants and exigencies of the hour, each leading his generation, but only while he sympathizes with its will, and either baffling or succeeded by his rivals, not in proportion as he excels, or he is outshone, in genius, but as he gives, or ceases to give, to the widest range of the legislative power the most concentrated force of the executive, thus uniting the desires of the greatest number under the administration of the narrowest possible control—the constitution popular, the government absolute, but responsible.

MINISTERIAL GOVERNMENT.—When Louis XI. was touched with the miseries of his subjects, his Ministers remarked, that they might think themselves very happy that they were not reduced to live upon grass.

PATERNAL GOVERNMENT.—In Hintza country, some time ago, there happened to be a hamlet of very old and feeble men. "Poor people!" said the Amakosa King, "Why are they not killed, and put out of their misery?"—*Alexander's Western Africa*.

TRUE PROGRESS IS PAINFUL.—The passage from a lower to a higher state of existence is always painful—hence, birth is painful—death (when valuable), is painful. To be taken from our old acquaintances and associations, whose instructions are exhausted, is painful: to be shaken out of our old notions to a higher stage is painful. Whereas, to sink is easy and pleasant—to hear over and over again our old ideas with merely a little variety in the manner, called novelty, is the delicious reverie of steady and consistent, that is, stick-by-the-way-philosophers. The old school precept was "take pains," and you will excel; the new school precept is, "take pleasures," and you will be happy. The school yet to come must reconcile both.—C. L.

PUBLIC SPIRIT.—A very large portion of mankind think they have little or no stake in the general welfare and improvement of the human race: that is, in their own improvement. They seem to think because there are prisons for convicts, asylums for lunatics, workhouses for paupers, &c., &c., that they are safe, and assured of all the blessings of life, provided they can succeed in the acquisition of wealth. They are too busy to perceive that their labour is half consumed in efforts to counteract the poverty, vice, and crime which their own course of life engenders in society. They condemn as utopian all attempts at improvement, though such attempts are in fact justifiable on the merest self interest. C. L.

GOETHE AND SPINOSA.—It is a singular fact, that, next to the Bible, the book which Goethe was fondest of, and which confessedly exercised the greatest influence on his mind, was Spinoza. So constantly, indeed, was he studying this writer, that Herder, on one occasion, is said to have exclaimed to him, "Why, you literally never read any Latin book but Spinoza!"—*Notes to Hayward's Translation of Faustus*.

ESTABLISHED LOGIC.—About three weeks ago, at a meeting in Edinburgh, to give important information on the state of religion in Sweden, the Rev. G. Scott, the Swedish missionary, spoke of the "purity of doctrine of the Swedish church, the excellency of her ritual, the scriptural and devotional character of her Psalm Book, the efficiency of her discipline, and yet, alas! the too general formality, coldness, and deadness of her condition, and the consequent evils existing in the land!" The *Scottish Guardian*, the organ of one half of the Scotch Establishment, prints this, but cannot understand it.

TO CORRESPONDENTS.

One of our correspondents has written to us, on the half of an old letter, apparently, and we find, in a strange hand, the following stray sentences, evidently referring to the Shepherd:—"The Satan of Heraud is intellectual liberty, versus, moral;" and, "Qy.—Does the Editor understand the motto from Coleridge?—namely, 'All theology depends on mastering the term Nature.'" We shall answer only the latter at present, because we mean to write an article on the former. What Coleridge meant by the motto concerns us not. We appropriate the motto. But we do not profess to appropriate it in the same sense as Coleridge appropriated it. Every man must appropriate the motto for himself. Coleridge perceived, what every thinking mind has perceived, the difficulty of believing in two self-determining powers,—viz., God and Nature; as also the consequences of regarding them as identical. If Nature be one power, and God another power—and if God be not responsible for what Nature does, then Nature is a self-subsisting God. Again, if God and Nature be esteemed one universal existence, this is Pantheism, which is denominated an accursed doctrine by the disciples of sectarianism, and formed no part of the creed of the great dialectician of modern times. The attempt to separate God from Nature, will mystify the clearest head; not even Coleridge could wade the deeps of this vulgar theology. Is there any man who can rest satisfied in the faith of two independent powers who exist together, in any other sense than the two polar energies of a magnet, which are really one? No; and men are afraid to regard them as one! On the one hand, they are puzzled to understand an unintelligible absurdity; and, on the other, they are afraid to admit a simple truism, which leads to the abolition of all ceremonial forms, and lip professions of religion, and is execrated by priests and their accomplices on this very account. We do not pretend to understand anything. Every subject whatsoever is too high, too deep, and too broad, for us. But, coming into a world, in which men act upon certain modes of reasoning, which are unsatisfactory to our mind, we battle immediately with these men, like an animalcule thrown into a glass of water amongst other animalcules of opposite principles, and, in doing so, we act from the impulse within, which is our sole authority. That impulse within, is the preference we give to a mode of reasoning, which begins by regarding existence of every kind and degree as a "perfect unity," and making this unity (God or Nature, or both) responsible for every mode—the cause of every mode. We regard Nature, therefore, as merely the sensual manifestation of God; its modes are perishable,—but its power, or divine energy, is imperishable or eternal. The modes being perishable, may be called profane, evil, or imperfect; the imperishable is divine, in the highest sense of the word; but the evil, or the perishable, is divine, in the lowest sense of the word. Hence, it follows, that in our mind, divinity conveys no idea of imperishability or authority, until we discover what degree of divinity is meant, which polar extreme it belongs to, or what intermediate position it holds between the two. The highest order of divinity is universality, and the social and liberal principles which peculiarly belong to it. The lowest order of divinity is individuality, and the selfish principles which are akin to it. But the apparent self-determination of individuals we believe to be a deception. There is only one power in existence. That power is "All, and in all."

We have some more correspondents to answer, or insert, but we must defer them to next week.

CHRISTIANISM THE BEST SOCIAL SYSTEM.

Blazoned as in heaven's immortal noon,
The cross leads generations on.—*Shelley.*

Other foundation can no man lay than that which is laid.—*New Testament.*

THE emblem of the cross is certainly strikingly characteristic of this world, in which virtue seems to be placed for the express purpose of being thwarted and vexed to the utmost. It was a part of the Platonic system of education in the republic, to rear the guardians thus—by trying them in every possible manner, consistent with health and future usefulness, and rewarding those with the highest honours who manifested the highest order of virtue, in braving the ideal evil which was artificially let loose upon them. Plato and Christ adopted the substance, without the emblem of the cross. The Christians have adopted the emblem, but they are averse to the substance. Instead of taking up the cross inwardly, and crucifying the selfish principles, that the resurrection and ascension of the social principles might take place, they have merely painted the cross on flags and banners, cut it out in ebony or ivory, erected it in stone or bronze, on cupolas and monuments, emblazoned it on shields, and interwoven it with other pious devices of the painter's and the sculptor's art, and thus deluded their consciences with the false persuasion, that they had taken it up in the selfishness of the heart. Alas! it is only the image or idol of the cross that has been taken up. The poor creatures who call themselves Christians, and pity the poor heathen who worship idols, little think how deeply they themselves are sunk in that very idolatry which they deplore. We are not speaking in reprobation of images and crosses, for these things may all be used in profusion when the heart is right; we are speaking of the *old man* of the heart, who is sinful and corrupt, and who cannot use any thing aright, whether it be a stone god or a spiritual god, and who ought to be dislodged, in order to make way for the new man, who takes up the cross in his selfish nature, and then, by this very act, becomes competent to use every thing aright, whether it be statues or pictures, crucifixes or relics.

Christianity requires to be *translated*. Every thing about it is, at present, read in the *old man's* language, and hence it becomes a cross to us in our social feelings, because we refuse to make it a cross to our selfish feelings. "Take up your cross," says Christ, "and follow me." This was the only advice he gave—"Follow me!" What is the meaning of this? The meaning evidently is, that we are to follow the man who, as the Son of God, "was rich, yet for our sakes became poor." "If any man come to me, and hate not his father and mother, and wife and children, and brethren and sisters, yea, and his own life also, he cannot be my disciple; and whosoever doth not bear his cross, and come after me, he cannot be my disciple." The same is said of houses and lands, and all things appertaining to *self*. It is the *meum* and *tuum*, the *mine* and *thine*, that constitutes the evil. This we are required to hate. *Poverty* is the door of the kingdom of heaven, that is, of the

true Christian system. The kingdom of heaven is given to the poor; and this kingdom is rich in itself as a whole, though each individual be stripped of all private possession, or right of possession, even to his very life, which is not his. The Jesuits adopted this model to a greater extent than any other society; but they adopted it very partially, and they were merely *one* sex; but in so far as they did adopt it, they increased their own power and their own happiness.

This crucifixion of self is identically the same as the extension of self, or the socializing of self. "Love thy neighbour as thyself;" that is, let self be larger than it is in this old world, do not confine it to your own body, or your wife and children, and your earth-begotten relatives; let it be as broad as the Church, and lost in the magnificence of the living body of Christ, of whom all men are members, and to whom alone all things belong. Christ is the heir. The living Christ, *to us*, is the Christ of this world, in whom the spiritual Christ resides. All things belong to him, in whom the fulness of the godhead dwells. There is only one proprietor. The "mine and the thine," therefore, must be abandoned in the individual sense. This is the cross. If any man refuse to take it up he is not a Christian. We, therefore, regard the whole Christian world as apostate; Churchmen and Dissenters are equally degenerate in our eyes. They are so infinitely removed from the Christian model, that we regard all their petty controversies about doctrines, and forms of worship, and forms of church government, as insults to the feelings of a Christ-born spirit, which can be satisfied with nothing short of the two fundamental principles of Christianity, namely, the absorption of the selfish in the social principle, and the recognition of divinity in the church so constituted. On these two pillars stand all the laws that are necessary to rebuild society.

What is it that makes men infidels, but the abhorrence which is felt at the awful apostacy of the Christian church, which men, not being able calmly to analyse, hastily ascribe to the religious principle, and thus transfer their energies to politics, hoping to accomplish the redemption of man by making laws for trade and commerce, at the rate of five or six hundred, or one thousand, bills per annum? It is the natural transition of inexperience. It will be of short duration. The bills will confound them. They are the bills of Antichrist. Christ has only one bill, and that is the Cross. Pass that bill, and then burn the statute-book. "The cross, the whole cross, and nothing but the cross." Why don't the Radicals raise this standard? it might shame the sham Christians. The reason is obvious—neither the Radicals nor the Owenites are practical men. The cross is the most electrifying banner they could wave. They are trying to supplant it with something else—but there is too much power in it to be put down, whether you take it in the right sense or the wrong. The battle is between the false cross and the true.

What other social system has taught more than Christianity has taught, and the Antichristian Church trampled upon? Neither Plato, nor More, nor St. Simon, nor Owen, has been able to discover another foundation. It is the same principle of equality and brotherhood which pervades all. There is only this difference between the system of Christ and that of others,

the *divinity* of the former,—as the hereditary lord of human society—against whom it is vain to make war, but with whom all difficulties may be removed, and all obnoxious doctrines cancelled. Even the keys of hell belong to the Church, to open and shut at pleasure. The doctrine of hell, and its punishments, is entirely at the disposal of the Church, and is translatable into any other meaning. The power of forgiving sins was one of the last privileges conferred by Jesus Christ upon his disciples. “Whosoever sins ye forgive, they are forgiven; and whosoever sins ye retain, they are retained.” The English translators have translated this “remit,” instead of “forgive,” because they were afraid of giving encouragement to Popery, which made a corrupt use of the power; but the meaning is plain enough, even with the word “remit,” and no one disputes it. Who then says that this power does not belong to the Church? He is not a Christian. But it can only belong to the Christian Church,—i. e. to a Church constituted upon the basis of Christian communion, of which the Lord’s Supper is merely the type, in which rich and poor eat occasionally together, until the substance be established as the prevailing custom of society. The old Catholic Church is the corrupt image of the new. All that the old has done in figure, the new will do in reality. The Catholic claims are just and well-founded, if the primary condition of social love be complied with as a basis. These not being complied with, in the false music (to use a Platonic phrase) of the Christian discipline, the whole social fabric is disorganized, and every act, every form, every rite and ceremony, partakes of the elementary corruption. But let the Catholic Church be truly organized, and, we have no doubt it would, in respect to hell and its punishments, declare that there were not two distinct places of rendezvous for good and evil, that all men went to one place, and that there was only one simple mode of rewards and punishments employed by God, viz., the one employed in this life, which smarts for a conscious fault, and approves for a conscious act of social beneficence. These are the hell and the heaven, which, through the magnifying glass of slavish fear, and the mystification of fanaticism, have assumed such ridiculous and impossible features, according to the character of the age which delineated them; but which finally resolve themselves into the simple laws of natural justice, so familiar and so acceptable to all men, even in this life. We say even this power is committed to the Church, for God has given all power to the Son, and the members of his body, and a living, a real power, it would be, for, if the Church condemned a man, he would *really* and *truly* feel condemned; and if it justified him, he would *feel* justified. In this respect the keys of heaven and hell belong to the Church, which has power, even over the conscience, to loose and to bind.

All Churches enjoy this power to a certain extent, but in a very limited degree, on account of the exclusiveness of their constitution. Universality alone can perfect that power. But the prejudice is very strong against universality. Some of the greatest blessings of life are those which create aversion at first. Curses are sometimes eagerly courted, and blessings fervently deprecated. Some divines have even drawn an argument in favour of death from this circumstance; concluding that it is likely to be the greatest of blessings, because it is universally dreaded.

A very modest creed, and yet
Pleasant, when one considers it,
To think that Death itself may be,
Like all the rest, a mockery.—*Shelley.*

Present Churches are merely close corporations, less free and vital in their administration than even a commercial establishment. But still, even in these petty conventicles, the subjection of conscience to the opinion of the sect is very discernible. General approval of a man’s conduct is a satisfactory quietus, and if any secret qualms be experienced by some, who are nominally justified by the assembly of their friends, it is only because there are secrets unrevealed which may alter the verdict when the veil is removed. Thus, also, public political characters rejoice in the support and commendation of public opinion, which, when decidedly expressed, is superlative autho-

rity in respect to public conduct; but only imagine the circumstances reversed, and a burst of indignation vented forth against an individual in consequence of an act which he committed, even with a benevolent intention, and you may form some idea of the power of a universal church over the conscience, in making either a hell or a heaven in a man’s mind, according to its judgment of his actions.

We do not consider the people at large to be competent for more than merely laying the foundation of a system. A legislative people we regard as a chimera. The people are only qualified to decide upon the fundamental moral basis. In this one respect we consider them infallible. “Democracies,” says Blackstone, “are usually best calculated to direct the end of a law; aristocracies to invent the means by which that end shall be obtained; and monarchies to carry those means into execution.”* This is a memorable sentence. There never was more political, and ecclesiastical, and purely religious truth, contained in smaller compass. But have the people ever *yet been permitted to direct the end of the law?* Never. And, whenever they are permitted so to do, they will only agree upon the grand Christian basis of fraternity and equality. The very disunion of the people in their religious and social capacity, would be the means of effecting *this* political justice, merely by the balance of power, and the composition of forces, if such a system were attempted at present; but unanimity would produce a more desirable result.

There is every thing, therefore, in Christianity that is necessary to rebuild this ruined world. The very want of system, which its opponents have complained of, is its greatest perfection. The system is unity and progress. “All power,” said the founder, “is given to me in heaven and on earth.” ‘I give the same to you; only unite upon the principle of Christian communion, and in the belief of divine authority, and the keys of hell and heaven, and the sceptre of the earth, are yours. The system is for you to make, when you are ready to make it.’

Some system makers have presumed to tell us at what age wisdom begins, and when the vigour of health decays; how many councillors there ought to be in a community—how long labour should last per diem—and how early a child may begin the intellectual discipline of reading and reasoning. This is forestalling human experience, and superseding human discretion, which may safely be permitted to judge for themselves, when living in comfort and security under the shade of their own fig-tree. They have even pointed out the only practical mode of building habitations, determining the size, and fixing the shape upon Conservative principles to all generations. This is certainly more than ever Christ taught. But that more is not an improvement. For no individual has a right to plan for society, unless he be its legitimate representative. All that Christ said was, “follow me;” “organize yourselves upon my principles, and then follow the spirit that is in you. That spirit is my spirit, whenever these principles are adopted, and it will lead you into all truth; but, until you receive these fundamental principles, you will be tossed about with every wind of doctrine, misled by the delusions of the devil, and bewildered by the conjurations of lawyers, the materialism of priests,† the mysticism of fanatics, and the swindling tricks of innumerable foes, which your own folly will generate in every department of society. I know that you will reject this spirit, and follow that of the old world for a long season, vainly hoping to mend that world by various measures of legislative policy; but my spirit will come again, and rebuild the Church upon the only principle upon which a Church can be built, and then the kingdoms of this world shall become yours and mine.”

This is simple nature, and pure rationalism, the only sound political economy. The people have been blinded to this gospel of the poor by the casuistry of priestcraft. They are even taught to believe that this genuine gospel of Jesus Christ is

* Introduction to Commentaries.

† Materialism is the basis of priesthood, especially Protestant priesthood; because it gives a self-determining power to Nature, which does things with which God has no concern, and for which he is not responsible. This gives birth to Deism and Atheism, which are merely the rebel sons of priestcraft.

blasphemy and impiety. Professing Christians will even be shocked at the profanity of our rough outline of their master's doctrine. So complete is the apostacy, that the living spirit of the Son of Mary is never to be perceived, even lurking behind the scenery of modern priestcraft. Infidelity is even nearer the kingdom of Christ than the thing called faith by the pseudo-pietists of Christendom. But the germ of Christianity is immortal; it may be buried in the earth for generations and centuries, but the decree has been issued that revive it must, and we hope to be instrumental in nursing the tender plant, whose branches will yet overspread human society.

TO THE EDITOR OF THE SHEPHERD.

Hear the continuation of Schiller's letters. The word aesthetic has been introduced into the German language, by Baumgarten, a philosopher of the Wolfian-Leibnitzian school. Kant and his followers have adopted this name, which has been translated into German, *Kunstlehre*, that is, discipline, or doctrine of the arts. Since the archetype of beauty is the standard of all the fine arts, which archetype is nothing but the divine principle of love, the æsthetic, or artificial education of mankind, has no other meaning but the development of the divine principle in man.

HERMES.

ÆSTHETIC LETTERS, ON THE CULTIVATION OF THE HUMAN BEING.

BY SCHILLER.

LETTER III.

Nature commences with man no better than with the rest of her works; she acts for him, when he, as a free intelligence, cannot yet act for himself. But this is the specific distinction of man—that he remains not stationary, as mere Nature formed him, but possesses the capability to retrace, by sudden efforts, through the aid of reason, the steps which Nature previously took with him, and thus to convert the work of need into a work of his own free choice, and from the physical necessity to rear up the moral.

He comes to himself from a slumber of the senses, and assuredly knows himself as man; he glances around, and finds himself in a state. The constraint of needfulness cast him herein, before he in his freedom could make choice of this place.* Necessity instituted his condition according to the simple laws of Nature, before he himself could do it according to the laws of reason. But in this necessitated state, that proceeded only from the calls of Nature, and was calculated only to answer those calls, he could not, nor can he attain his freedom in the moral character—and sad would it be for him if he could! By that very right, therefore, by which he is a man, he abandons the domain of this blind necessity, as he, in virtue of his freedom, separated from her in so many other particulars; as he merely, to show one example, abolished by moral practice the vulgar character that exigency had impressed on sexual love, and ennobled it by fairness. Thus he, in his maturity, recalls his childhood, even as the artist does; he pictures to himself a state of nature existing in idea, which state, indeed, has not been furnished by experience, but is necessarily established by the inherent determination of reason; he obtains in this ideal state a final purpose, which he know not in his actual state of nature, and a choice of which he was then inca-

pable; and now proceeds altogether as though he were commencing anew from the creation, and were exchanging, with clear insight, and with free purpose, the state of independence for that of mutual compact. However skilfully and firmly blind self-will may have grounded her work, however assumingly she may maintain it, and with whatever show of honourable worthiness she may environ it, he must, in this proceeding, treat it altogether as though it had never been; for the work of these blind powers possesses no authority before which freedom needs to bow, and all and every part must be adapted to that highest final purpose which reason has erected in his peculiar form of being. In this way the endeavour, of a people arrived at maturity, to transform their natural form of government into a government of courtesy,* originates, and is prepared aright.

This natural government (as every political body may be termed, that originally derives its institution from force, and not from law,) is now indeed opposed to the moral man, to whom mere legal moderation must serve in place of law, but it is quite sufficient for the physical man, who gives laws to himself only in order that he may settle with the powers that be. But at present the physical man is *real*, and the man of courtesy is only *problematical*. Then, if reason abolishes the natural government, as she needs must, if she will fix her own in its place, she risks the physical and real man for the sake of the problematical man of courtesy;—she risks the existence of present society for a merely possible (although morally necessary) ideal of society; she takes from man something that he really possesses, and without which he possesses nothing, and then points out to him something that he should, and possibly ought to possess. But should she have reckoned too much upon him, she would for the sake of a (high notional) humanity, in which he is yet deficient, and may be deficient without damage to his existence, have torn from him the means of supporting the (lower) animal character, which yet is a condition of his manhood. Before he had time enough voluntarily to hold fast to the law, she would have drawn the ladder of Nature from beneath his feet.

The chief consideration, therefore, is, that physical society must not cease for an instant in *time*, while the moral is forming itself in *idea*; that, for the sake of attaining the dignity of man, his existence should not be put in peril. If the artificer has to repair a clock, he lets the wheels run down; but the living clock-work of the government must be repaired whilst it is beating, and herein lies the question—How to exchange the revolving wheel during its rotation? That support must be sought for the continuance of society, which will render it independent of the natural government that is to be dissolved.

Such support is not to be found in the natural character of man, the selfish and the violent, that aims much more at the destruction than at the preservation of society; neither is it to be found in his character of courtesy, which, according to our previous supposition, is yet to be formed, and on which, because it is free, and because it is never manifested publicly, the lawgiver has never worked, and never could securely reckon.

* *Seinen Naturstaat in einen sittlichen umzuformen.* These words, *sittlich*, customary, *sittlichkeit*, customariness, are exceedingly important. I wish to be permitted to use them as synonymous with *courteous* and *courtesy*; the *court* being the highest standard of *custom* to a subject nation. Thus Spenser writes:—

"Of courts it seems men courtesy do call,
For that it there most useth to abound.
And well besemeth that in princes' hall,
That virtue should be plentifully found
Which of all goodly MANNERS is the ground
And root of civil conversation."—B. vi. c. 1.

If ever this courtesy shall be extended to the people, the laws will come to be delivered in the form of recommendations and requests, the taxes will truly become *benevolences*, freely paid; and it will be discovered, as it was by Queen Elizabeth, that the coffers of the people are the best treasury of the prince. Could she have placed her treasury in their hearts, it would have been better still.

* *Stand, stance*, though used in archery, is rather obsolete.

"Did I request thee, Maker, from my clay
To mould me man? Did I solicit thee
From darkness to promote me?"—*Par. Lost*, x. 743.

"For mis'ry seiz'd me at my birth,
And cast me helpless on the wild—
I perish!—Oh, my mother earth!
Take back thy child."

Jas. Montgomery.

The purpose of æsthetic* culture, then, so far as we have proceeded, is resolved into these points—to abstract the wilfulness from the physical character, and the freedom from the moral; to make the former subsist in harmony with the laws; the latter depend on the impressions; to remove the one somewhat farther from material objects, and bring the other somewhat nearer to them; and thus gradually to generate a third character, that being allied to both these, may smooth a passage from the dominion of undisguised force to the dominion of the laws, and so far from impeding the development of the moral character, should rather serve as a sensible pledge of unapparent courtesy.

* Note on the word æsthetic, derived from “aïsthanomai,” I feel, I perceive, and expressing the state of being spiritually alive in feeling and perception.

Were I required to give a simpler title to these letters than the æsthetic, I should call them Love Letters. They are conceived by that spirit of love, which being at first educed from the soil of female beauty, springs up and expands into all the relations of life, investing each of them with beauty and with sanctity. The form of letters is indeed peculiar to these, but every work of art is in its essential nature such a letter, conceived in solitude and secrecy, and “cast silently into everlasting time,” yet never failing of its destination; for being given in charge to all that is vital in humanity, it will not perish but with life itself. They are the offspring of ideal passion:—

“That doth reject all show of pride, admits no outward sign,
Because not of this noisy world, but silent and divine.”

ANTIQUITIES—DRUIDS—TRINITY.

There is no particular study to which man is addicted, which may not be turned into ridicule. The most sacred and the most profane are alike susceptible of caricature. Lawyers, clergymen, and physicians are all burlesqued, and the poor antiquary contributes his share of the public merriment. But it is in the individual himself, and not in the study where the ridiculous is perceived—every species of knowledge is useful, and every department of study tends either to discover hidden truths, or to detect suspected errors.

By the aid of antiquarian research, we now know more of the history and character of primitive antiquity, than was ever known to the literary world, since the Christian epoch. Contrary to the commonly received opinion, that we lose more and more the knowledge of the past as time progresses, and that as we increase our knowledge of science, our knowledge of history must either retrograde or remain stationary, we find that a knowledge of antiquity progresses with every other species of knowledge; that as geology is reading backwards the history of stratification and creation, so antiquarianism is reading backwards the history of man and of human society.

We spoke some time ago of Egyptian antiquities. But a new field of inquiry has lately been opened up in Tuscany, and another in America, and one, probably still more interesting than either, is likely to become the scene of keen research in a short time, under the patronage of the French Government; we mean the ruins of Carthage, a colony of Phenicia, intimately connected with Asia Minor and the great empires of ancient civilization. It is perhaps a very fortunate thing, that the contemplated excavations of Carthage have been deferred so long, and that in the meanwhile, considerable progress has been made in that department of antiquarian research, most likely to throw light upon the valuable discoveries, which shall, without doubt, be made in those subterranean repositories of ancient relics. In the meanwhile the harvest is not come, the career of human curiosity is not yet closed; there are more worlds to conquer, abundance of material for future generations to seek out and examine. There are ruins in all parts of the oriental world, now preserved in most desirable security by incurious ignorance and barbarism, and this sweet repose will never be disturbed till the light of civilization dawn once more upon the land which

gave it being. The antiquary will follow this light, spade in hand, the miner of history; and his labours will retrace the steps of time, whose memorials, like the sun, will rise from the earth, and restore to view the knowledge which has been lost or faintly perceived in a long night of intellectual darkness. The bowels of the earth are shelves of the library of Providence. Treasures of knowledge are there preserved, which, when they are found will no doubt unmystify many of the pages of history, and enable us to understand the moral reason why cities were sunk, and barbarians placed over them, till the day star arose. Man must fall and rise again. It is done *once* on a great and magnificent scale, but when he rises, he not only recovers all that has been lost, but he finds more by his fall than he could ever have discovered in a state of unbenighted progression.

Signor Campanari is now exhibiting, in Pall Mall, several curious relics of Etruscan antiquities, consisting of Sarcophagi in which many specimens of Etruscan art were deposited, such as tripods, vases, urns, and different utensils of admirable workmanship. The sculpture is peculiarly excellent, evidently of the Grecian school; yet the language of the inscriptions, is neither Greek nor Latin, but something a kin to Phenician and Irish, thus corroborating the opinion of those who suppose that a Celtic dialect at one time overspread the whole western world, and formed a bond of union amongst its inhabitants, now utterly lost or broken by incognate tongues. Latin and Greek are more allied to the Sanscrit of India, than to the Celtic of ancient Europe.

It is only within these last thirty or forty years, that the literary relics of ancient Druidism have obtruded themselves upon the notice of the learned world. Before the end of the last century, our only source of information respecting the Druids, was, the classical literature of Greece and Rome, which was very partial and imperfect. The imagination of the pious, however, filled up the shapeless outline, and, says Mr. James* in his Patriarchal Religion of Britain, “exhibited to the world, a picture so highly coloured with human blood in the Vandal style, that Druidism has been looked on by most, ever since, as a monster too hideous to be mentioned, except in terms of abhorrence and disgust.

“All this time,” continues Mr. James, “a vast treasure of original records on the subject, lay *undisturbed* in the various parts of the principality covered with the dust of ages, and suffering wofully from the ravages of time. The ancient British Druids and Bards had committed their traditions to writing at the time they were in danger of being lost through the invasion and persecution of the Romans. These were afterwards transcribed from time to time, by different hands, as appears from notes subjoined to the copies still extant.

“But the language in which these records had been preserved, being the ancient British, rendered their contents inaccessible to most, except the natives themselves; and they apparently were all asleep; however, at length some of them were roused from their lethargy, by the constant misrepresentations that issued from the press, and began to explore these fast decaying remains of Druidic lore, with a view to vindicate the general character and religion of their remote ancestors, and the result was as follows:—

The author then enumerates the principal publications, which arose successively out of this lately begotten zeal for Druidical research.

“About the year 1792, a short sketch of Bardism, which had been from the commencement a component part of Druidism, and was still a surviving branch of it, was given to the public by William Owen, Esq., F. S. A., the celebrated Philologist and Lexicographer. It was embodied in his introduction to the heroic elegies of Llywarch Hen.”

Two years afterwards appeared another still shorter epitome of the Druidic system, from the pen of Edward Williams, the venerable bard of Glamorgan. In the year 1804, the Rev. Edward Davies, curate of Olveston, published under the most illustrious patronage, his “Celtic Researches on the Origin, Traditions, and Language of the Ancient Britons.” After that

* Curate of Almonbury, Yorkshire—1836.

the valuable memorials of Druidism were published, in three octavo volumes, under the title of "The Myfyrian Archaeology," by the late Owen Jones of London, a native of Denbighshire, at his sole expense.

Mr. James' Patriarchal Religion of ancient Britain, is compiled from the authorities above alluded to. Being a clergyman, his principal object has been to show, from an analysis of Druidical records, that the religion of the Druids was the same in substance as that of the early patriarchs of the Jewish Church. Simple religion, unmixed with forms and ceremonies, is the same in all countries, and in all ages; but the singular respect of the Druids for the Trinity, is still preserved on record in a work called the Triads, supposed to be written by the Druids themselves. In this respect the Druids were rather in advance of Abraham, Isaac, and Jacob; for, although these three patriarchs are a triad in themselves, they do not appear to have paid any particular respect to the triune views of God and Nature. Their principal religion was to take care of themselves, and live in peace, if they could, like sensible men. The Druids were a literary fraternity, who had more opportunities of acquiring natural knowledge than could be enjoyed by simple shepherds; and there was no revelation made to Abraham of religious truths of any kind, except this, "that through his seed should all the nations of the earth be blessed." This seed, St. Paul says, means "faith,"—in other words, faith shall save the world. What Abraham thought of it we do not know, but it is probable that he thought, as any other old gentleman who loves an only son would think. He has had a son after the flesh, but the nations are not yet blessed, and his own flesh seed have refused to receive the flesh deliverer. It is probable, therefore, that even this revelation, as Abraham understood it, was no truth at all. How far it is a truth yet, even in the minds of modern divines, is a subject for learned dispute, on every side of which much can be said.

But, if such modern inquirers after the secrets of antiquity have made bold attempts to penetrate the mist of ages, and even to ascend in vision to the flood itself, and the world beyond it, they are outstripped by others, who regard the Druids merely as degenerate moderns, who succeeded a more noble and intelligent race of men, to whom the secrets of Nature were still more penetrable in proportion to their distance from the times of authentic history. These superior patriarchs are called by O'Brien, in his Round Towers of Ireland, Hyperboreans, Tuathdedananna, and Dánnan Boreades. "Originally the Druids were a humble set of men, without science, without letters, without pretensions to refinement; but, having succeeded here (Ireland) to the fraternity of the accomplished Dánnan Boreades, who, in the revolution of affairs, were forced to communicate their acquirements to the opposite but prevailing priesthood (i. e. of the Scythian invaders), those latter so far profited by the ennobling opportunity, as to eclipse all other Druids, as well in Europe as in Africa."—(*Round Towers*, p. 57.)

These are bold speculations, not altogether unfounded. There are materials, both literary and architectural, extant to give them plausibility, and, as we have remarked, there is no reason to doubt that we may yet be able to read history backwards, so clearly as to give satisfaction upon some of those interesting points. Mayhap, even the Hyperboreans may prove the degenerate successors of still greater men; and the pigmies of Coshocton, lately discovered, entombed in Ohio, United States, and measuring between three and four feet and a half, may prove at last to be the parents of science and of art. We shall know more of these things when we meet with the shades of the mighty dead.

The antiquity of the Trinity, however, is a curious question. Both Faber and Cory have searched it out, with singular industry, amid the ruins of ancient philosophy. It is almost, if not altogether, universal in some shape or other. Cory, in his introduction to his *Ancient Fragments*, published in 1832, says, that from a comparison of the legends of the east and west, he concludes that "the most universal idea of a deity is that of a male and female principle constituting a hermaphrodite,—the one—the universe itself, from which proceed three hypostases, or persons, which separately are one with the monad who re-

presents the whole."* In a later work, just published, the only knowledge of which we derive from the *Literary Gazette* of July 22nd, Mr. Cory asks, "How comes it, that a doctrine so singular, and so utterly at variance with all the conceptions of uninstructed reason, as that of a Trinity in unity, should have been from the beginning the fundamental religious tenet of every nation upon earth?" The reviewer regards this as too sweeping an assertion, for he seems to except Arabia, Mexico, and Peru. The exceptions, if they are exceptions, are trifling; but we discover something still more sweeping in the assertion, that the doctrine is at variance with all the conceptions of uninstructed reason. It is nothing more than the musical theory of the Greeks, called diatessaron, the three-four system of Socrates and Plato, of Pythagoras, Timæus Locrus, Aristotle, &c., who naturally derive it from sensible signs in Nature. Thus Plato did not require revelation to teach him that the vital parts of the body were three—the head, chest, and abdomen; in the former of which he placed reason, in the latter anger, in the third desire. He could not avoid it, neither could Aristotle avoid perceiving that every sentence, as well as every line, had a beginning, a middle, and an end; that time was past, present, and future; and the monad is that which makes them all. What more natural than the idea of this monad? Mr. Cory, writing from an ecclesiastical college, naturally desires to prove that the Trinity is not the religion of Nature! We, on the contrary, believe that it is the religion of Nature,—that Revelation is but a branch of this religion of Nature—to which we must all return, like prodigal sons, with our Bibles, our Encyclopedias, and our grammars and dictionaries, in our hands, and be reconciled. We not only maintain that our religion is the most universal in meaning, but it most universally commends itself to the head, and the heart, and the desires of mankind, in all ages and countries; and, moreover, it has all the authority of antiquity, both sacred and profane.

Both Mr. Cory, and Mr. James, and the *Literary Gazette*, however, seem to be blind to this analogical fact, that the law, being the representative of unity, and the gospel of division or liberty, the Trinity is with propriety concealed among the Jews and the Mahometans, the latter being merely the second or Ishmaelic branch of the family of Abraham. The attempt to force the Trinity upon this family is rather hazardous; and the singular connection between the Jews, and the old American nations, acknowledged by the *Literary Gazette*, and apparently insisted on by Mr. Cory, in searching for the ten tribes, may perhaps associate the Americans with that department of progress which represents the unity. The Gentile Church, or the Church of reason and science, is the Church of the Trinity. What the Jews did know of it was borrowed from the outer court. Jesus Christ appropriated it, and sent it out by authority.

* This is just the doctrine of the *Shepherd*; the most ancient doctrine—agreeing with all revelation, and of which every other religion is merely a corruption.

THE TRANSCENDENTALIST'S DIALOGUES.

No. V.

ON "THE ONE."—(Continued from p. 36.)

Transcendentalist.—Materialist.

Mat.—The observations you last made to me were a little obscure, but, by reflection, I think I have arrived at your meaning. You mean this: any given length or breadth, as, e. g. a mile, a square foot, &c., is but a portion of some greater length or breadth, and it is only because I, or any other perceiving being, apprehend such a portion and no more, that this portion is constituted. Thus, suppose there is a straight line,

A B

continued infinitely at both ends, which I have expressed by dots, you mean that the finite portion which lies between A and B would not exist without a perceiving being to set those bounds. It is not the mere A or B that creates the division, for

the line is continued just as much as if they were not there; but the presence of a perceiving being, who proceeding from A, and stopping at B, as it were, arbitrarily declares that those points shall be the boundaries of a finite line.

Trans.—That is exactly my meaning, and I am delighted that we have arrived so far. There has often been an apparent childishness in our dialogues, especially the third, of which I was most anxious to get rid. But these conversations, trifling as they may seem, have brought us to one important result, namely, that in no portion of matter shall we find that which is really *one*, really self-subsisting; that talk of what we may, we must assume the presence of a perceiving being, and hence, that it is the absurdest thing in the world to place matter as the origin of all, mind included. However we may have wandered, we have been all along usefully employed in striking at the bulwarks of that deadly atheism, which gives matter the predominance. But, perhaps, you do not see what a length we have gone. I will show the extension of what we have deduced. Referring to the line drawn above, we find the portion between A and B separated from the rest by the act of a perceiving being. And how does the perceiving being do this, how does he gather, as it were, the small portion into his mind—must he not begin at A, mentally draw the line to B, passing over a number of dots in his passage? But I will render this plainer. If I draw a very long line, the whole length of a wall, which is yet not so long but that its whole length may be perceived without turning the head, and then draw a line of an inch in length, will it not take you a longer time to apprehend the length of the former than of the latter?

Mat.—Most assuredly.

Trans.—And, therefore, do you not see that apprehension is succession—that in apprehending a line, you pass from point to point, and that it is, by stopping in your journey, that you have brought the object to a one?

Mat.—Methinks I do not see my way so clearly as before.

Trans.—Look here! there is a whole bag full of halfpence; I have emptied them on the table—now clutch up a shilling's worth at one grasp—neither more nor less.

Mat.—I cannot find out what makes a shilling's worth, without counting.

Trans.—And what do you mean by counting? Do you mean going on adding one to one, thus—1, 2, 3?

Mat.—Of course. What else should I mean?

Trans.—Well, then, now count out one shilling.

Mat.—(after having counted.)—Here is a shilling's worth, namely, four and twenty.

Trans.—But why did you stop? Why not go on counting twenty-five, twenty-six, &c.? There are plenty more halfpence on the table.

Mat.—Yes; but you told me to count out a shilling, therefore I stopped at the twenty-fourth.

Trans.—Now you know what I mean. With your mere eyes you saw the halfpence just as much before you counted them as afterwards. But you see you could not bring them to a *one* (one shilling), without first counting them—i. e., performing a successive operation, and then stopping and dwelling on those you had counted. Now, observe the use of memory in this matter; had you forgotten the first while you were at the third, you could never have summed up twenty-four, but the oneness which you gave them, as it were, inclosed them. You pronounced that the halfpence *altogether* made *one* shilling. Observe the progress: first, there is the adding together one, and one, and one, the power of mind which accomplishes his addition, we call the imaging power.

Mat.—Is not "imagination" a better sounding word?

Trans.—Yes; but "imagination" has in this country acquired a peculiar meaning. It signifies the power by which we create images not belonging to the outer world, as centaurs, mermaids, &c. Now, I suppose the sensible world to lie before us, in a large unapprehended mass, and that we, by an act of imaging-power, model our various sensations into objects. The German for the word imaging-power is *Einbildungskraft*, while that for imagination, in the confined English sense, is rather *Erdichtungskraft*. Enough of this. The imaging-power, as it were, goes on adding one to one, building a something, but is

not of itself sufficient to complete that something; just as if you had gone on counting the halfpence, and never stopping, and an infinity of halfpence had ever been pouring on the table, when you would never have made up a shilling, for you would have passed over the very bounds that constitute that shilling. Then comes another power, which is the understanding, and commands the imaging power to stop—prescribes a rule—says, so far shalt thou go, but no farther. You *understood* what a shilling was before you began to count.

Mat.—Certainly; or how should I have known how many to count.

Trans.—This was the proposition in your mind, twenty-four halfpence equal one shilling. That is, twenty-four and no more must be added, to form the unity called a shilling. This *understanding* what a shilling was, told you the requisite bounds you must put to the progress of the imaging-power. Now, do you not follow the same plan with other objects? I lay this sheet of paper on the mahogany table, both table and paper are present to your eyes, to separate them must not you draw in your mind the line of demarkation? Must you not go on dot, dot, dot, all round the sheet of paper? And yet you must not go dot, dot, on to infinitum, or you would never complete your addition; but here the understanding assumes the mastery, and declares that your addition shall stop when you have come to the corner whence started, if you would apprehend *one* object. So is it with a wide prospect, you may add this house to this tree, and this tree to this garden, but would you make it *one* prospect—(and you cannot otherwise have a prospect at all), you must limit the addition at some point or other.

Mat.—And with respect to "the one?"

Trans.—Why, observe! There would be no "*one*" in the world without perceiving beings. You cannot find a single one in the world of sense, which is not a portion. Look at yonder cottage, it occupies but a portion of space; above, below, all around it, are other objects which limit, and which indeed constitute its form. But what renders the cottage a *one*, as distinct from the things about it? What, but your beginning at a certain point, going on adding, and then collecting the whole into a *one*, as I said before. The one is in the mind of the observer; he collects more or less sensations into this one; and hence, those things which we called aggregate *ones*, in distinction to pure *ones*, are merely *one*, so far as they are bound together by the *one* in the mind.

THE SELF-CONCEIT OF THE PRETENDERS TO CHRISTIANITY.

"Among a few of the American tribes indeed," says the writer, of the article 'America,' in the *Edinburgh Encyclopædia*, after affirming that some of the tribes have no idea of a God, and not even a word in their language to designate him, "there appears to be something like an irregular pointing at more correct notions of a Deity. They have some indistinct and wavering discernment of a being who made the world, and presides over the changes which take place upon the earth. They even call him the great spirit: but they attach no idea to the word spirit, which would leave us to believe that they have any conception of a God, who is divested of corporeal organs. They have no temples, no ministers of religion, and no established form of public worship. And their mythology is so wild, and so incoherent and absurd that it does not merit a place in any regular history. Ariskoni or Agriskouè, the God of Battle, is the chief Divinity of the American Indians. Him they invoke by a solemn imprecation and appease by various ceremonies, when they go forth to war; and they believe that they will be successful, or otherwise, according as he is more or less disposed to favour their wishes. They acknowledge also a being, whom they denominate the Master of Life; and a great number of inferior spirits, or genii, who take part in the concerns of mortals, and occasion their happiness and misery. They are, of course, divided into the beneficent or malign. From the latter the diseases and calamities incident to human nature, are supposed to originate, and on the agency of the former the cure of diseases and success in undertakings of smaller importance, are imagined to depend."

Now this account of Indian Theology is evidently intended to

excite contempt and pity in the readers' mind; and yet how amazingly like the religion of our own enlightened country it is in some respects, and how superior in others! We will suppose a native of China making the tour of the world, in order to publish an authentic account of its different countries, and their various inhabitants, to the people of the Celestial Empire. It is not improbable that he would describe the religion of the English people in language, somewhat resembling what follows.

"Amongst the English there is something like an irregular pointing at the idea of a Universal Deity. They have some indistinct and wavering discernment of a being, who made the world in six days, and then took rest on the seventh, and ordered all men ever after to rest on the seventh day also. They call him Jove or Jovah, sometimes Providence, but more frequently God. They say he is a Spirit, and that he is omnipresent, and that by him all things exist, but yet they talk of him coming down, and looking down, and interfering, and neglecting, as if things existed well enough without his care or administration. They have also temples in which they cry and pray to this spirit, to interfere and bless them, and save them from something which might befall them, if he did not put forth his shield to protect them. The prayers they repeat, were made for them nearly three hundred years ago, and they have been chiming them over almost every day since. Their mythology is very wild, and incoherent. They believe in an inferior God, called Satan, who is the God of evil—but they never pray to him to cease doing evil. They pray to the other God to bind Satan. They differ in this respect from the Ceylonese, who pray to Satan himself, and entreat him to be quiet, by offering him sacrifice. The English are horrified at this practice of the Ceylonese, and send out missionaries to prove that the prayers should be offered to the good God, and not to the evil one. I asked some of them why the good God suffered the evil one to molest them. They said it was because their first parents had eaten some fruit which the good God forbade them to touch. I laughed, but seeing them offended, I restrained myself, remembering that I was a stranger, and enjoying the hospitality of a people, naturally kind and generous, but strangely benighted in religious opinions. They told me that this God called Satan is the leader of a large band of rebel and marauding spirits, or genii, whose principle employment is to corrupt political and religious institutions, and to multiply human evils; that these genii were once in heaven, but rebelling against God's only son, the son and his angels cast the rebels down into hell, where they built a large palace, called Pandemonium, where they hold their councils, and where all the schemes of desolation upon earth are contrived. Such success attended the machinations of these demon Gods, that all men would inevitably have perished, and God would have been obliged to send their souls to perdition to please his justice, if God's son had not proposed to become a man, and please his Father by dying on a cross. This has saved a great number of human souls; but still the greater proportion are lost, by being consigned to the power of the demon Gods, who will endow them with their own nature, and take them to the bottomless pit for ever. The principal object of these English barbarians, in their public worship, is to persuade the good God to save them from the bad God and the bottomless pit. I asked some of them which of the two gods was the God of Nature. They said the good God was the God of Nature, but the bad God was the God of this world, and had crept in and corrupted all that the good God made, so that now it was hard to say which of the two was the God of Nature. They pay a great sum of money yearly to priests to teach the people this curious doctrine, and they send preachers to all parts of the world to teach it to other nations. There are some in China, I am told, and these barbarians say they have made some converts. I do not doubt it. There are many fools in China, who, having weak minds of their own, are easily swayed by stronger minds. I have made a convert in England. I have converted my man servant to the faith of the universal God, and might convert many more were I so disposed; but it would not benefit them. The attempt upon my servant was merely an experiment. He is exceedingly zealous in his new faith, and wonders he never perceived such simple and consoling truths before. The Christian religion is a very great source of contention among this

people. There are innumerable sects which hold different shades of opinion concerning it, and who revile, hate, and persecute each other, on account of these differences. It is evident that they themselves do not understand it."

Suppose we read the above in a Chinese publication, could we say it was an inaccurate description of Christianity in England? Certainly not. Then pause and think before you condemn the savages of America, or of any other country, merely from a one-sided account of some bigotted missionary, of some vagrant gentleman, or half-pay officer, who has traversed the wilds of uncultivated nature, to collect materials for obtaining literary celebrity, by the publication of something new and interesting to the satiated minds of this reading, priest-blinded, generation. Last week we quoted the opinion of Elias Hicks upon the Indian theology, which, he says, is decidedly more spiritual and more consistent than that of self-conceited Christians. We believe that all that has been popularly taught about Polytheism is misrepresentation, and that it will be discovered at last that all nations have had, and still have, more or less distinctly the idea of one God. Even the Egyptians, those notorious Polytheists, according to Jamblichus, who is excellent authority on such subjects, "believed in the origin of all things from one, with different gradations to the many, which are again held to be under the government of the one." (*Jamb. sec. 8, c. 2, 3*). Who is this one, and who can he be, but the true God? The minor gods are merely personifications of attributes existing in him, or coming out from him, into separate manifestation. These are, properly speaking, the objects of outward worship. The true God cannot be worshipped outwardly by forms and ceremonies. The people are sure to corrupt every outward rite. This is the experience of ages, and the learned and the unlearned are equally prone to this apostasy. The only truly sacred rite is that by which society is constructed upon the principles of equality and fraternity. But nothing short of a stupendous and overawing miracle can accomplish this, if ever it shall be accomplished in this world. We think that something like a model of it may be effected; but every thing in this world is mockery. Even the kingdom of Christ, which the Church has forgotten to expect, is probably only a type, or lustrous shadow, of a better state of being. We know not; but this we know, that the churches and chapels of Christendom are merely pretenders to the name of Christian schools and temples. The whole world is under the dominion of the wicked one; the true God that men worship is not the God they mean to worship. There is another and a greater God still in reserve for better men, and a more perfect social system. We cannot love or respect the God of men, whose notions of right and wrong we despise.

A DIALOGUE BETWEEN THE SHADE OF SOCRATES AND A RADICAL.

Socrates.—And so you think, if the people made the laws, all would be well?

Radical.—I do.

S.—Does it require knowledge or ignorance to make good laws?

R.—Knowledge, to be sure.

S.—What sort of knowledge?

R.—Every sort, I suppose.

S.—And you think the people possess every sort of knowledge?

R.—No; they are very ignorant.

S.—Then the majority of the people, not being possessed of this knowledge, cannot use it?

R.—But they can choose a man who has it, to represent them.

S.—But I suppose they will dictate to this man what to do, and in this case it will be ignorance dictating to knowledge?

R.—It looks like it.

S.—Let us look at it again. There are two species of knowledge—intellectual and moral. The *first* consists of learning, or science; the *second* is merely a *sense* of right and wrong in moral actions. Which of these is most common?

R.—The latter, I judge; it is almost universal; every sen-

sitive being receives it by instinct, without the discipline of schools and colleges.

S.—Well: the people possibly may have this moral knowledge, without having the intellectual knowledge?

R.—I believe they have.

S.—With this moral knowledge, then, they may safely act the part of dictators or legislators?

R.—I think so.

S.—But what sort of legislation would it be which originated in moral discernment? Would it be moral legislation, or commercial and trading, protocol and scheming, legislation?

R.—Moral legislation, I believe.

S.—Moral, only; then there ought to be a distinction drawn between the moral legislation of the people, and the intellectual legislation of the experienced?

R.—Perhaps it would be better.

S.—But which of the two is greatest?

R.—The moral, in my opinion.

S.—The moral, certainly. The foundation then should be laid in the moral sense of the people, and the superstructure should be raised by the skilled and the experienced?

R.—I think so.

S.—Why then should the people trouble themselves about this or that intellectual measure,—the effect of which they can know nothing of? There is only one act of legislation which the people can pass as a body, and that is an act by which society is reconstituted upon the principles of social equality and universal fraternity. If this foundation be laid and preserved, legislators will have little to do, and in doing that little they can do no harm to a well-disciplined, thinking, industrious, cleanly, sober, and cheerful people.

R.—It is very true. I think we trouble our heads about too many things, we are quite confounded, and every day increases the confusion. I see now what you have always told me, but I never could understand, that it is not the intellectual, but the moral principle, that can do us any good. If intellect is to save us, the popular sovereignty would be our ruin; but, if the moral sense is to save us, popular sovereignty may prove a blessing. But it can only be a blessing by the people confining their legislative propensities to the fundamental moral principles of law, for, if ever they enter into the complex details, we look in vain for repose to our agitated population.

S.—The people then would become a church or a moral association, and in this church the state would act according to the fixed and eternal law of social equality; which law of social equality would preclude the possibility of hereditary privileges, private appropriations of land, monopolies, and other plundering arts, by which the people are deprived of their rights. This is as much as can be done in this world by law, and if men were well educated, and trained to industry, and a high sense of honour, individual discretion would finish what the law had begun. You confound yourselves and divide your ranks by your political economy, your currency, your ballot, and your other nonsense. Teach the people that one moral act is all that they ought to pass, and then they may sit down and rejoice in the deliverance of themselves and their children. Plato and Christ have both taught this great truth. I taught Plato. You will find no better teachers than we three.

R.—I believe not, you are generally esteemed the wisest and the best of men, but are not well understood.

S.—We spoke darkly, from necessity. It was the custom of the times in which we lived. You, in this age of freedom, cannot understand the influence which compelled us to act as we did. It was the purpose of Providence that it should be so; and the Spirit of the age is his agent for compelling men to fulfil his designs. You are more free;—and there is a change coming upon the public mind, of a moral character; if properly directed, it will produce great good; but if you go back to the intellect, study minor details, and forget the principle, you will die as you have lived, murmuring and growling, abusing and censuring, and vexing yourselves more than your opponents.—*(Shade disappears.)*

R.—The old gentleman is right, he has given me many a good lesson since I was in the habit of being visited by his spirit. But what is the use of it? I cannot convey this simple

unlettered wisdom into the public mind, which is at present charmed by the serpent, and eating the forbidden fruit of knowledge, which it was told us at the very creation would be our ruin. I believe it, and see it now in a new light. This tree of knowledge will be the curse of the people; it is the tree of life alone that can save them, but that is guarded by the cherubim. Who are those cherubim? I will ask the old gentleman the next time I see him.

TO CORRESPONDENTS.

A Theocratist.—*We were very much pleased with the letter of a Theocratist, and also with the accompanying periodical. We shall feel obliged to him if he send us the remaining numbers. His final object and ours are identically the same, we believe. Our opinion of the means may differ. If, however, there be something in us offensive to him, he ought to remember that we also have feelings which may be offended in like manner. Now that which most offends our feelings in him is the apparent fleshliness of his creed respecting the person of Christ. Our own idea of the Son of God is, that it is the Spirit of God in the Church. Our correspondent hankers after the body of Jesus Christ, which has disappeared long ago, and as far as we are concerned, as far as our knowledge extends, has no existence; but the Spirit of God in the Church is always present, either in a state of humiliation or exaltation. During the great apostasy of the Church, the Son has been crucified. During the dark ages the Sun has been darkened, and the Moon, that is, the Church, has been turned into blood; but the Son of God in the Church will rise again, and redeem the Church, according to the promise. We suspect our correspondent is rather more Jewish in his creed than we are; he forgets the mystery of types, which are employed in the old Jewish Church to signify universal truths. He is mistaking a type for a substance. Jesus Christ was the last of the Jewish types. He prefigured the Son of God. But as it was usual in the law to talk of the sacrifices, atonements, and types, as if they were the real substance, that the people might know no more than was intended to be doled out to the age for the time being, so also the Apostles spoke of Christ as the final substance, though Christ and the Spirit spoke of another coming, in language even less mystical than was employed to predict the first coming. The whole Church, Greek, Roman, and Protestant, errs in this one point—in mistaking the type for the substance, and trusting to an arm of flesh. It is vain for our correspondent to attempt to bring us back to the flesh, now that we have embraced the spirit. We do not reject the mission of Christ and his Apostles. We have the highest respect for them; but we cannot suffer ourselves to be so far deluded as to regard any fleshly sacrifice, whether of lambs, goats, or man, or God-man, to be equivalent to the great and only sacrifice for sin, which is to be performed in the heart by the crucifixion of self.*

The Association our Correspondent speaks of is neither for him nor for us. The time has not yet come for a union capable of acting with efficiency. The people must be humbled, and disgusted, and disappointed, still more. They must “rage and imagine a vain thing” for a little longer. They are as yet too confident of the utility of political schemes. We hope our Correspondent will think seriously on what we have written, as we consider him to be in advance of the Church, and only wonder that he does not follow the advice of the Spirit, “Come out of her, my people, and be not ye partakers of her sins.” Let him also know that we also believe in “God manifest in the flesh,” i. e. in the body of Christ, for the universal Church—a God “who is with us always.” But a God who goes away and leaves us, is not exactly suitable for our necessities. Who is it that leaveth the sheep when the wolf cometh?—the true shepherd, or the hireling?

C. L., on education, next week.

The article on Love, by a lady, we suppose, we will use in a more amorous number than the present.

Alienus.—We will go on and sketch the outline, whatever be the consequence.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Pantheism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 7, Vol. III.]

SATURDAY, AUGUST 12, 1837.

[PRICE 1½d.]

TWIN IDEAS.

But I have lived, and have not lived in vain.
My mind may lose its force, my blood its fire,
And my frame perish, even in conquering pain,
But there is that within me which shall tire
Torture and time, and breathe when I expire.
Something unearthly, which they dream not of,
Like the remembered tone of a mute lyre,
Shall on their softened spirits sink and move,
In hearts all rocky now, the late remorse of love.

Byrop.

HITHERTO we have talked of a system; might it not be prudent to pause awhile, and consider whether no system might not be better? The latter seems the more probable and possible of the two. It is an easy matter to get into confusion, but it requires exertion of mind and body to produce order. It is easy to fall; but it is difficult to mount. Evil seems to come without exertion; good is the offspring of labour and perseverance. The weeds cover the earth of their own accord. Nature is exceedingly bountiful in weeds. It is only the skill and the wakeful industry of the husbandman, which make the soil productive of such fruits as man has appropriated to himself. Uncultivated nature is, probably, better for the brutes; but if the lord of creation designs to fit the world for his own special enjoyment, he must become a *second* Author of Nature—the Son—the subordinate ruler of the world.

Is it better that the Father or the Son should reign; that Nature, primary Nature, should rule, or art, *i. e.* secondary Nature, bear the sway—or may there be a compromise between the two, and how can that compromise be made?

Some say, let us banish religious discussion from all public affairs! We say,—well, banish it! do banish it! We should be very glad indeed to see religion entirely banished from public discussion. It is not a subject for controversy. It is for feeling, it is for the heart; it is a principle of life, a sort of moral respiration, an atmosphere of being. It is not a thing to fight for, like a piece of land, or a cargo of merchandize. Drive it out of public discussion, that is, drive it into the heart, and let it there work in secret, and manifest itself morally in the conduct. That is all we seek. We ask no more. Drive it into its proper element, its own sanctuary, and do not suffer it to come out into the intellectual arena of strife. But if, by banishing religious controversy from public affairs, you mean confining it to private and social affairs, we rather doubt the possibility of this scheme, and the utility of it after it is accomplished. What is public justice or morality, but the outward exhibition of an inward principle of religious or moral feeling? If men are at variance privately, or secretly, on these first principles, confusion must reign outwardly in society. One party complains, and demands a reason for offensive conduct; another party, in reply, gives a religious reason—and thus the controversy is necessarily renewed.

It is really a fact, whether men perceive it or not, that religion and self-interest are at the bottom of all political institutions.

There is a party in society, of curious personal experience,

who, not knowing what a religious motive is, deny its existence, and ascribe all profession of religion to hypocrisy. This party has mixed itself up largely with reform, and introduced its own peculiar phraseology into the language of Liberalism. It employs the selfish argument alone. It stirs up the personal interest of the poor to assert its rights against the self-interest of the rich. It disdains the religious argument, and endeavours to row against the stream of public feeling, by decrying it as hypocritical or knavish. This has woefully retarded the cause of reform. A character of sensualism has been attached to the party. Its opponents have taken advantage of the exclusive materialism of its views, to depreciate its character in public estimation. They have designated it as grovelling, base, unidéal, unpolished, and connected it with revolution, bloodshed, assassination, and every species of disorder. This is, no doubt, a slanderous and unmerited reproach. But still there is a substantial reason for it. There is its exclusive use of the selfish argument, and the recommendation of knowledge, political knowledge, for the sole purpose of obtaining selfish ends of a sensual description. These selfish ends are useful ends, beyond a doubt. Necessaries for the body are the first cravings of Nature. All men feel these cravings. Some feel these cravings only; but others feel them in common with, and in subordination to, an appetite of a more refined and ideal character. These latter are not to be caught by the political bait alone; and they have natures delicately susceptible of impression from the music of thought, which belongs to the supersensual department of being. Many of these are Reformers at heart; but, not satisfied with the ostensible character of its principal agitators, they withhold their suffrage.*

Thus it happens that liberalism is at variance with itself; but the *ultra* has preferred the alliance of the rough and unshaved, and, in so doing, it has preferred the minority to the majority. We have long endeavoured to ascertain what portion of the multitude belong to this bearded party of liberalism, but find it impossible. We have tried the newspaper standard, but it is imperfect. A daily paper starting upon ultra-liberal principles, of the common character, is a certain failure. The liberals cannot, or will not, support a daily paper. The *True Sun* has never paid its own expenses. The *Constitutional* had a circulation of less than one thousand. This, however, may be accounted for by the poverty of the popular party. But how are we to account for the comparatively small circulation of ultra weekly papers, compared to those which they, who call themselves the people, in an especial manner accuse of truckling to the money-mongers and shopkeepers? Poverty will not account satisfactorily for this circumstance, for we do not even find them in the coffee-houses, where a demand would be sure to introduce them.

* A few weeks ago, in the Borough, we overheard one working man ask another man (who had come out of his shop without his coat) for whom he meant to give his vote. "I don't know," said the other; "I cannot well vote for any other than Harvey; but though he is a very clever and active man, I do not like his mind." What the man meant, we know not; but evidently he meant a something, which even talent and liberalism could not supply.

The personality and abuse of political controversy will for ever prevent the possibility of bringing it to a close, and the Tories have a peculiar advantage over their opponents, in addressing the religious feeling which the liberal party might with great propriety propitiate. Moreover, although a Radical paper is not more virulent than a Tory paper of its own level, there is a peculiarity about Tory virulence which we have never seen pointed out, or even alluded to, which forms its specific distinction, when compared with its counterpart. There is a humour, a playfulness, a jocularly about it, which the other religiously abstains from. So, that if you were about to draw the caricature of a Tory and a Radical editor of the first-water, you would naturally give the former a jolly, waggish, pompous, and supercilious, haughty, tyrannical air, if it were possible to combine all these features in a single outline; whilst, to the latter, you would adjudge sternness, gravity, austerity, implacability, and vituperativeness of the highest order. If we are correct in this draught of the two extremes of faction, we think the difference may very easily be traced to the rejection of the poetry of thought by the Liberals. It has often been observed that this is not a poetic age. The observation is just, and there may also be justice in the remark—that mere poetry is of little use; but mere prose is equally useless. There is a taste for poetry (we do not mean either blank verse or rhyme) in human nature; it is as universal as the musical appetite. When pure and simple, it is always ensnaring, and when intermarried with important prosaic truths, it not only enriches the latter, but imprints them on the memory, by enforcing the attention. Now, poetry is essentially musical; it may be biting, and sometimes sarcastic, and even harsh, and severe to excess, but it must always be musical. The music of debate, when that debate is harsh and severe, is best preserved by the exhibition of good nature or jocularly, faintly perceivable through the mist of vituperation. This is seldom or never seen in the censures of the Liberals, it is almost always discernible in those of their opponents. Now, this music is not only a religious feeling in itself, but it is almost the necessary consequence of adopting the religious feeling as a guide. The religious principle is highly poetical, and the most cultivated minds will always rally around it. It is the "sweet home" to which the wanderer returns, after having searched in vain for happiness amid the bustle of society.

How easily might liberality and reform invest themselves in the richest robes of religious and poetic thought! They imagine they would lose by this procedure! On the contrary, they would find it a key to the hearts of men. The religious principle of the world is a false principle—its Christianity is false—its morality is false—its faith is corrupt. All is false about that very bond of union which is one of the strongest elements of human society.

The twin ideas we are comparing are the persecution of religion generically by name, and the persecution of the false specifically.

When the former plan is adopted, there is a stigma immediately attached to it. The latter is the most politic, and the only method which can possibly succeed.

But when it is adopted, how should it act? Does the true religious feeling necessarily lead to a system of society? Can it not exist independent of politics? It cannot. It is a principle of action. It reveals itself, when genuine, in every department of human activity; *first*, in the domestic circle, the education and government of children; *second*, in the social relationships of life; and *third*, in the universal government of the community. A man cannot be religious as a father, and irreligious as a public officer. If so, he himself is a knave, and his affairs are in disorder. But may not true religion be developed in the heart, and yet the present system of property and private intercourse be preserved? No. True religion condemns the present system of property; and were it generally developed in the public mind, a regeneration would very speedily take place upon equitable ground. But would it be essentially necessary to reconstitute society upon the model you have suggested in the *Shepherd*? That depends entirely upon the degree of pure religious principle imbibed; perfection in principle, will lead to perfection in practice; but any deficiency within, will reveal itself without. We do not pretend to determine what

society will ultimately accomplish, or how much pure reform it at present could accomplish. All we have ever aimed at is the outline of the pure Christian model. We think it very easy to determine that such a system would go as far as we have suggested. But we allow that it is rather too fanatical a hope to anticipate a complete realization of a Christian policy, more especially at a time when priestcraft has succeeded in obliterating almost every vestige of its master's simple doctrine. But in reviving the knowledge of Christ's doctrine, we are putting a weapon into the hands of the poor, which will be of more real service to them than their present prosaic denunciations of political vengeance, and the zoological growlings of their infuriated and unpolished disaffection. We would show them how to make war with their oppressors in a more effectual and systematic manner, by referring to a common and simple standard of acknowledged authority, and by insisting, either upon a fulfilment of the Christian law, or a renunciation of the Christian name by their opponents.

This would reduce the great public controversy within a small compass. It would collect the scattered leaves of sybilism. All the people would understand the true object of both parties, and the object of discussion would be the simple question, whether is the selfish and wealth-grasping system, or the social and wealth-diffusing system, the system of Christ and the gospel of glad tidings to the poor? There can be no doubt that the present mock Christians would be shamed, and thousands would be convinced by the religious argument, whom no selfish considerations of a pecuniary or sensual character could ever induce to listen to, or treat with common respect, a mere prosaic or political doctrine.

It is a strange infatuation which has seized the modern novices in philosophy that the religious argument is an impractical mode of proceeding to regenerate or ameliorate society. This is a wide departure from truth. The view which we have taken of it in the preceding paragraph is a sufficient confutation of the erroneous notion. But if you want corroboration, we send you to the Liberals and the Radicals, to their newspapers and their public associations; to their plans, their opinions, their notions, their contrariety of movements—a whirlwind of action by no means difficult to control, by the spirit which directs the storm. Ask all these parties what is the standard they appeal to? They say the people. Well, what is the people? Is it the party which broke down Mr. Bell's hustings at Coventry, or the party which voted for his return? There is no people. The people, as an active speaking body, is not yet formed. "But we want to form them," say the Radicals, "and for this reason we claim universal suffrage." "Well, very good; but is that an inspiring theme? do you find it very electrifying?" "Not very." It is too sensual; it is pure prose; it is deficient in feeling, and yet it is the only theme of a universal character, to which the Radical musicians ever tune their pipes. It cannot array or rally the people. It never can form the people. But supposing it to succeed, what next? You must teach the people what to do, and that is merely what we think it prudent to tell them at present, to arrange themselves on the side of true Christianity, and with spirit to attack the false. It is impossible to imagine any other mode of procedure of a practical nature. It would cut the old world to the very quick. The old world may recover from any other wound but this. It is the death blow of Satan's kingdom, when the people arrange themselves on the side of Christ, and claim in Christ's name the government of the world. The present generation of materialists have in their wisdom adopted other views, but the children will find out the mistake of their fathers, who will go down to their graves, in disappointment, the victims of their own miscalculations.

EDUCATION PRACTICALLY CONSIDERED.

BEING THE SEQUAL TO

"EDUCATION IDEALLY ENGENDERED."

By moving the lowest part of a mass we move the whole; whereas, on the other hand, we may operate on the higher strata without penetrating to the bottom.

By applying to the lowest conditioned human beings (that is to say, the immoral and the lazy) progressive plans of education,

ou force a movement, on the part of all classes superior to the lowest, which by persuasion or moral appeal would never be accomplished. When "the peasant's toe comes so near the courtier's heel as to gall his kibe," he will move forwards, but not till then. Thus a national movement may result from individual beginnings.

They who have power are fearful of losing it by any movement, progressive or retrograde. They act as cautiously as a man carrying in a crowded street a shallow dish brimfull of milk to his starving children. Even the slightest concussion makes him a loser.

They who have no power are likewise the ignorant, who know not how to attain it, though they have as strong a will; supposing that in worldly power alone is the desirable good. Both parties, it is true, are equi-distant from the source of real education; and the movement must not be expected to originate with either as a class. It is therefore vain to project joint-stock efforts either of money or minds. The former is attracted by the profit to the subversion of moral progress. The moral mind, alas! exists not in sufficient force, for that is in fact the result we have now merely in hope. From a few individuals only, as in all ages when real progression has ensued, can we rationally expect any actual advance in education.

Any practical plan for immediate application will consequently be limited to such amount of money as benevolent individuals can singly apply; and to such number of pupils as the few devoted and talented teachers, which the commercial spirit does not involve in its soul-destroying vortex, can reasonably and justly undertake. These are the two great difficulties to be overcome, but the latter is by far the greatest of all. Compared to the apathy of monied men or women, the disregard of the public, the intrigues of politics, the drawback of sectarianism, or any other deadening influence, the want of the real teacher, abounding in love, and light, and energy, is the master defect. He is the great unknown, which the manufacturing notions of modern popular philosophy, with all wealth and science to boot, cannot ever hope to draw forth.

Under these considerations the realization of the subject would be a sort of Missionary or "Camp School." An actual example of self-denial and universal good—tendency, moving, as necessary or convenient, from place to place, as fast as a progressive foundation had been laid in any neighbourhood; so that by small means much good seed should be sown.

Suppose the teacher or teachers ready, the shepherd prepared to lay down his life for the sheep, and of duly qualified intellectual and physical capability, a moderately sized house may be taken with at least—acres of land. To the building should be added temporary wooden rooms of large dimensions, a sort of long tent, erected over a gravelly dry spot, sufficient to accommodate all the inmates in hammocks at night, and to serve for general purposes in the day time, after the manner of Captain Brenton's asylum. Almost every article of consumption being produced or made, within the institution, in the simplest manner, economy would be carried out to the fullest extent.

Of mere intellect there is perhaps enough already in every stage of society: at all events no apprehension need be entertained on that account. The primary object, therefore, is, by the influence of love and truth, to let be developed in each pupil, a conscious re-union between him and the re-mitting power, to lay firmly the foundation of virtue, not in mere words, but in the actual living existence of each one. The secondary object is to carry on the education of the outward faculties, as well the senses and organs in themselves, as in connexion with some work of the most extreme utility, such as agriculture, gardening, carpentry, implement making, and the like.

Though such minutiae need not be discussed here, it may be observed that for each pupil to be engaged exclusively one hour per day in the first object, from one to four hours, according to age and other circumstances, given to intellectual pursuits, the remainder to various manipulations and amusements, appears an arrangement which would enable one principal teacher, with several subordinates, desirous of further improvement in their own being, to operate most effectively on any given mass of ignorance or wayward disposition. As the latter description of youth requires to be placed in a mental atmosphere, super-

turated, if possible, with moral life, an excess of immorality would endanger the whole affair.

Another reason for having a moveable exemplar school is that after a few years spade labour, with the produce consumed on the spot, and the manure remaining, the land would be brought to as high a state of production as could, under the ordinary systems, be afterwards kept up. From this source alone constant profitable employment is found for the scholars, of whatever age or capability; and their presence becomes a physical and moral blessing wherever they may pitch their tent. Of course any external modification of the idea could be effected, suitable to the views of parents or patrons. All that I assert a necessity for is the presence of one concentrated and centralizing mind, yielded willingly and sacrificially up to the good work; and for at least one establishment where the poorest and the vilest shall not be excluded. Mind is the atmosphere in which mind is developed; and the brick and mortar arrangements, though not to be neglected, are very subordinate.

If the government could pre-select those who without some interference will inevitably fall into the criminal class, it would certainly be advantageous to the nation to pay for such prevention. And although Britons are not born and brought up in strictly defined castes and occupations, like some Asiaties, there is considerable approximation to that condition. The son succeeds the father for many generations in similar employment; and that parish police must be very unobtrusive who could not point out clusters of families wherein neither integrity nor industry is acknowledged, but whose youthful members are sure hereafter to prey on the morals of society in some mode or other.

An education which by such unexampled means could secure, in patient submission to the eternal law of human being, these enumerated grand objects; that is to say, the development of the living conscious moral sense, and handicraft energy; actual god-love, and practical neighbour love, working constantly together in intellectual clearness, would do much towards placing poverty in a new position, at once gratifying to the benevolent heart, blissful in result to each pupil's being, and, it is hoped, in harmony with the forward progress of human redemption.

C. L.

THE SATAN OF THE POETS AND THE PRIESTS, COMPARED WITH THE SATAN OF NATURE.

IS our first number we alluded, *en passant*, to the Satan of Herard, in his "Descent into Hell," and other Poems. The observation was rather vague, or indefinite, and it was a mere accident which prevented us from enlarging upon it at the time. The subject is important; but it is almost impossible, in the present state of our language, and popular theology, to allude to it without mystery and offence. The phrase which is employed by one mind, with a consistent meaning, is received by another as a positive absurdity, merely because the latter wants the expletives, with which the former supplies the defects of language. A note in a correspondent's letter, received by us a few days ago, upon this subject, is perhaps more indefinite and unmeaning to the general reader than any form of expression we have ever used. "The Satan of Herard is intellectual liberty, *versus* moral." We believe the writer means that the intellect is not in its proper element when free, or master, but when subject as a servant to the moral principle. This is true enough, intellect is inferior; but, when intellect and morality of the first order are separated, it is difficult to imagine which of the two is most devilish; and, when they are united, they are one, and the intellect rejoices in its subjection. In supposing, therefore, a controversy between the representative of *beau idéal* orders of intelligence and morality, we must give an inferior degree of intelligence to the former, for the highest order of intelligence loses itself in the highest order of morality, and never would oppose the moral supremacy. It is evident, then, that the Messiah of the poets ought to be superior in reason to the Satan of the poets. Have the poets made him so? No; and where he fails, is in a deficiency in the moral principle. In other words, the poets have only been able to give the victory in argument

(not gunpowder and steel, like Milton's vulgar war in heaven) to the Messiah, by divesting the Messiah of a portion of his moral perfection, and making him a tyrant. They could not help it, the muse would have *struck*, rather than given a different result upon the false theological principles they assumed.

Satan is supposed to be a *beau ideal* of something. He is at the head of his profession. That profession is *evil*. What is the evil? Pray, what is the evil which this eminent actor, "by merit raised to his bad eminence," professes. We suspect it is *hate*, the negative of love, which is God. *Hatred* is the Satan of Nature. Love is the God of Nature. Is there love in unrelenting cruelty?

We regard the two Deities as the exact counterparts of the chemical, positive and negative forces, which pervade ALL inanimate nature; and of the moral, positive and negative affections which pervade all animate nature. Satan is to God, what an alkali is to an acid, or hatred to love, or prejudice to charity. There is neither good nor evil in either essentially, but only relatively. If love produces pleasurable sensations, it is good to him who enjoys them. He who feels the pleasure, feels God within him, blesses God for his bounty, and expatiates on his goodness; but that very love which he feels, may be the means of tormenting a fellow-creature, who, through the atmosphere of his own feelings, not more selfish than the other's, ascribes the *love*, the hated *love*, to witchcraft and the devil. There is virtue in *hating* evil.

In the two polar principles of Nature, one is always supposed to be more active than the other; therefore, one is called positive, another negative. It is not really so. But it seems to be necessary so to represent them. One thing is clear, they cannot act alone. Were there no creation, we might suppose there was no Satan. That is no opposition principle, for the Deity would be at rest, and the Satan which originates in the creative power would be still. But as soon as a creation appears, and separate individuals are produced, Satan must begin to work. The two selves can only have intercourse by means of Satan. Whenever *THE ONE* is broken Satan appears. Satan is one self looking at another self. If the two selves do not fully understand each other, and if the moving principles within are different, alienation is the necessary consequence. This is the beginning of the satanic nature, and there is no end to its variations. Satan, therefore, is the representative of the selfish principle. But, as selfishness fights with selfishness, so Satan fights with Satan; in other words, he leads both armies to the contest. Satan, therefore, is a divided power, whose tendency is to destroy itself.

Being divided, he must needs have a double personification, and here it is where the grand secret of Nature, and the failure of the poets and the priests, lies; namely, in the double personification. Satan is the leader of both opposing selves. If two parties claim each a right, to the exclusion of the other party, both parties are satanic. But each calls his own leader God, and his enemy's leader Satan; just as he calls his fellow-soldiers friends, and his opponents enemies. Out of one universal Deity, therefore, necessarily arise two divinities, God and SATAN.

Did men understand and love each other, these two would become one.

The God of this world, or evil, is Satan—or God divided. The God of the world to come, or good, is God—or Satan united.

To oppose the universal God to Satan, therefore, is an impossibility. The God who is opposed to Satan by the poets and theologians, is Satan himself in his dexter character. Their Satan is his sinister character. The Father, Son, and Satan of Milton, are only one Satan, in several characters.

"Son, thou in whom my glory I behold
In full re splendence, heir of all my might,
Nearly it now concerns us to be sure
Of our omnipotence; and with what arms
We mean to hold what anciently we claim
Of Deity or empire. Such a foe
Is rising, who intends to erect his throne,
Equal to ours, throughout the spacious North," &c.

Milton did not intend this to be Satanic, but he could not help it. *Mind* would not otherwise delineate a *party* god, for a party god is a Satan. Hence the failure of *Paradise Lost*, in attempting to "vindicate the ways of God to man," upon the principles of scholastic theology. The Deity of Milton is a partizan. The Son is a simpleton, with royal power. Satan is a desperado, of imperturbable courage, full of cunning and resolute daring, but destitute of wit to defend, by argument, his own cause. Milton seems to have been afraid to suffer God and the Devil to contend by reason, the only legitimate mode of controversy to be adopted by such superlative intelligences; he therefore settles the dispute with steel, powder, and shot, and makes the rebel angels tear up mountains by the roots, and hurl them with vengeance on the heads of their invulnerable opponents. This is exceedingly heathenish, and vulgar in conception, totally unworthy of the power of mind and beauty of diction, which will always rank the "*Paradise Lost*" amongst the Pagan poems of the very highest excellence.

All the poets have failed in their Satans; but, more especially have they failed in their Messiahs, when contending with Satan. It is not from want of *ability* in the poet, but of *liberty*, whether intellectual or moral, we know not. There is a *fear* discernible, which weakens the impression, and makes one wish that the character had either never been attempted, or drawn with the force and vivacity of colouring which Nature has really given to the original. We believe no man ever read a dramatic representation of Satan and the Messiah, whose imagination did not infinitely outstrip the poet's utterance, and shroud, in the magnificence of his own conception, the paltry striplings which the fear of public censure or of God's avenging wrath, had clipped and cabbaged in the poet's mind, till the original idea was so horribly distorted, that it could no more be called the legitimate offspring of the muse, but the bastard offspring of priestcraft and the muse in a personage. Milton's Satan is merely a knight-errant; a sort of Orlando Furioso, without the chivalry; a madman, dashing out his own brains; a fiend.—Klopstock's is worse, for with Klopstock there is redemption from hell; Abaddon, the repentant fiend, is received into glory.

"—Mid eternal gloom had God
Far from himself and his creation, fixed
Hell's dismal bounds; for in the universe,
That theatre of mercy, was no place
For woe eternal found."

This is very reasonable.* But how, in this theatre of mercy, such an incorrigible fiend as Satan, who committed evil, *con amore*, regardless of the eternal punishment which followed it, could find an existence, can only be made known by the muse in canonicals. It is evidently not natural. It is something like Egyptian sculpture; it may be sublime, but it is very ridiculous.

Heraud is more spiritual, and therefore preferable in our estimation. Not that we regard the Satan and Messiah of Heraud as fully brought out, but there is something lurking behind the curtain of speech, whether intended by the poet or not, which betokens something which Milton's slavish fear and scholastic theology was afraid to reveal. Thus Satan says to Messiah:—

Hell's Majesty obeys the Son elect
Of the eternal universal Sire,
Then wherefore *thine* alone? or of thy sect?
So I appeal from thee to Him whose fire
Consumes and purifies (and why not me?)
And my reward for services require,
Demand my guerdon of his equity!
Where is sin's strength *but in the law*? Death's sting
But in sin's being?—Am not I he

* That is to say, if you take it without the context; but the hell of Klopstock, although out of the universe, is a real place. This is a most singular poetic licence. But poets, like fools, are privileged characters, although like fools, especially kings' fools, they teach the noblest truths.

Who am of Death the power and the king?
For whose sake wreak I vengeance? For mine own?
 They wrong not me—I want no worshipping!
 I do his work, a rebel to his throne—
 For why? because I deign not to confess
An equal my superior—God alone,
 Who made me what I am, nor more nor less,
 Him I adore, the invisible!—not thee,
 The visible intelligence express,
 The Mediator to the creatures. He,
When hath he spoken? Him would I believe,
 But laws by thee repeated, I am free
 To obey or disobey, reject, receive,
 Even as it likes me. Faith is for the slave:
 Free souls will know, endeavour, and achieve.

Then why my suffering? and what its source?
 What crime to be like God, if he be good?
 And that sought I by reason and discourse,
 By might asserted, and in battle wooed.
 If God be love, would not his love attract
 All creatures to himself, well understood?
 Oh! my desires were lofty as mine act!
 Supernal, still ascending, to attain
 The highest point of glory, to transact
 With the Invisible, above the train
 Of seraph and archangel, ministries
 Sublime and great; vain aspiration, vain.
 Father of Spirits! mine angelic eyes
 Pined to behold thee, and mine ears to hear:
 Impatient of eternal mysteries,
 I rushed into the Holiest! What found there?
 No God of Love, but a consuming fire,
 Wrath terrible, and vengeance most severe!
 No witness of his love, but of his ire,
 I look in vain the evidence to find
 Of the far bruited mercy of thy Sire.
 His justice may have proof, yet the stung mind
Doubts of the justice that gave being to
 Creatures for death and misery design'd,
 Transitive or enduring—made to do
 And suffer wrong—the populace of hell—
 Who sought but to become as one of you—
 Demons and men; and fell even as I fell!

What Heraud himself thought of this, we know not; but in the next stanza he calls it an insensate plea, and sets Messiah to refute it. We shall see next week how the muse assists him, and whether she be dressed in her pure Grecian robes, or in sacerdotal garments. What the reply wants in force, it makes up in length. The poet wrote Satan's speech from the heart; the Saviour's came from the head. It is an Alexandrine line, a wounded snake; not betokening want of talent, but want of truth—and poetic truth is a thing which cannot be forged.

THE RED COW;

A FABLE OF DISSENSION, SHOWING THE NATURE OF SCHISM
 IN THE UNIVERSAL CHURCH.

Murderer.—We are men, my liege.

Macbeth.—Ay, in the catalogue ye go for men;

As hounds, and grey hounds, mongrels, spaniels, curs,

Shoughs, water-rugs, and demi-wolves are cleped,

All by the name of dogs.—*Shakspeare.*

IN a former life I was dissatisfied with my fellow-beings. I had looked into the works of Homer, and I said—"Why should not all men be poets?" I had read of Leonidas—"Why should they not be patriots?" I had seen the face of Socrates, as in a glass—"Why should they not be philosophers?"

Thus discontentedly questioning, and not knowing who could answer me, I verged continually to all various points of doctrine; and was torn round like a balloon at sea, which a whirlpool and whirlwind concurring would carry all ways at once,

towards all unknown things and places; till, after a time of agony, the heavier being torn away, the lighter tended upwards to the world of mind. A very strange world is that, for there is neither space nor time, but all things are themselves purely, without growth and without decay, abiding in the everlasting life; and that life is being, and knowledge, and power, and virtue, and beauty, and glory, and eternal joy to all that partake of it; and they have perfect freedom, independence, and necessity in choice; and they have all things in themselves, and themselves in all things; subsisting by an eternal, but pre-established harmony, according to a wonderful manner in the world of mind.

And in tending thither I was calmed, and floating freely, as in an element—neither too light nor too heavy. I was carried pleasantly along, till I found myself where the wise ancients dwell. And when I came there, each saw my want in my face, and looked kindly on me; and Æsop, who sat lowest, but next to, and far above me, told me a fable.

"There was a cow, and she was red, and she fed in the infinite plain where all creatures are ever feeding. But she was well fed and ill fed. For the sun shone warmly, and the soil was fertile; and thus she had abundant food; and the more she ate, the less she stirred; and thus she was ill-fed, for her feeding tended to death. And as the nature of cows is, she could only see some parts of herself. But there was a little muddy pool in which she was pleased to stand when she neither fed nor slept; and there she looked upon that part of herself which was red, and upon her shadow, which was not red, and being elated with the making of a shadow which the light of heaven by diminution made, and which indeed had neither shape nor beauty, she grew to be a syllogistic animal, knowing that a good argument loses nothing by order, and a bad one looks all the better for being put in martial array. After standing, therefore, a long time in the muddy pool, and meditating shallowly on what was without her, she leaped up suddenly and ran among the herd, thus lowing forth her sentiments:—'I am a cow, and I am red, and therefore I am a red cow,—a very perfect pattern for all cows that be; and, therefore, there are no white ones.' And all the herd laughed at her, for there were many white, and even black ones; and they thought her more foolish than became a cow. So she found they did not think like her, and she saw the white and the black cows as they were roused from their resting-places; but though she saw that they were truly white and black, she did not think them so good as the red ones, nor so properly to be called cows; but she dared not say so. Thus she kept this remnant of ignorance as a secret piece of private property, and it always hindered her knowing better."

Then I was instructed; for I saw that after a human fashion I had been imitating the vaccine reason of the red cow; and I was ashamed and pleased, and I thanked Æsop, which he said was mannerly on my part, adding, that I should find but very few to thank me for comparing them to the red cow. C.

PLATO'S REPUBLIC, OR SOCIAL SYSTEM.

No. III.

HAVING established a community of property, Plato does not consider it necessary to trouble himself about the theories of political economy, which seem to have occupied the attention of the rulers and people of Greece, as keenly as those of our own country. The forum was a scene of intense political excitement, more so than our Exchange, for attendance was not confined to money-mongers alone, it was a general rendezvous for the whole population, who clubbed together in parties, discussed the affairs of the republic, and guided the current of political opinion.

"But what now, by the gods," says Socrates, "as to those laws relative to matters of exchange, and to their traffic one with another in the forum, and, if you please, their traffic likewise among their handicrafts, their scandals, bodily hurts, and raising of lawsuits, their institution of judges, and likewise such imposts and payment of taxes as may be necessary, either at the forum, or at stores. * * * Shall we dare to establish any of these? * * * I imagine that a true lawgiver ought

not to give himself much disturbance about such a species of laws and police, either in an ill or well regulated state; in the one, because it is unprofitable and of no avail—in the other, because any one can find out some of the laws, and others of them flow, of course, from the habits arising from their early education."

Such is the summary manner in which Plato passes over the whole science of political economy, as a subject so exceedingly trifling, that it is beneath the dignity of a wise legislator to frame artificial laws for a people who are living under the government of a moral system, whose continued influence is favourable to the development of the social virtues. Under such a system it will be more difficult to break than to obey the laws. The sense of honour, when finely cultivated, is a more powerful motive of action than obedience to the dead letter of any legislative enactment.

We must not omit to mention the last, and in Plato's estimation, the most important feature of this social commonwealth—that to the Delphian oracle belongs the greatest, the noblest, and most important of legal ministrations—the institution of temples, sacrifices, and other worship of the gods, demons, and heroes; likewise the depositing of the dead, and what other rites ought to be performed to them, so as to make them propitious.*

It is a very small proportion of the ten books of the republic which is occupied in sketching the outline of the social system. It is too simple to require much detail; and the author has employed the remainder of his work in analysing principles and characters, classifying them, and tracing them to their primary sources and ultimate consequences. The "good" he sets above all knowledge. The being good, and the knowledge of good, are the highest human attainments; but he that is this good, and *knows* it, can discourse of it; hence discourse, or dialectics, is next in order to "the good" and an essential qualification of a governor, whose value is to be determined by the goodness which he possesses. But goodness in the Platonic sense is not supposed to exist apart from the development of the intellectual faculties. Hence arithmetic, geometry, and all the universal sciences, are particularly insisted upon as essential qualifications of a ruling mind. The sciences which form the principal subject of inquiry to modern *sanans*, and constitute the Protestantism of philosophy, had not a distinct being in those times of infant universalism. Harmony, analogy, and music, were the geni of wisdom; and as that is accounted the sweetest and the best music, which is most irresistible in captivating the attention, in calming the passions, and tuning the spirit to sensations of pleasure and social unanimity, so, in like manner, was that accounted the highest order of wisdom, whose influence, by the prose or the poetry of speech, or the power of example, was greatest in producing the same harmonious and moral result. In those times, however, mind had not yet gone through the analytical process of science; hence its synthetical attempts were failures. Philosophy was in infancy. Its general object was correct, but it met with difficulties from the progress of experience in the arts and sciences

* Some sectarian philosophers, who ascribe the Pythian oracles to priestcraft, without knowing any thing of the subject, may smile at the credulity of the universal philosopher, or perhaps, keep up the spirit of their creed, by ascribing this sentence to Plato's craft, in humouring vulgar prejudices. But Plato did not write for the vulgar; and he who defied public prejudice so independently in other respects, would not slavishly succumb to it in this. Plato, and all his sect, believed in the reality of the Pythian inspiration, and they had better opportunities of studying the subject than we, whose knowledge of it is chiefly derived through the mist of Christian bigotry, and the gloom of the dark ages, the obscurity of which is not yet past. The Mahometan ladies, according to Miss Pardoe, produce the Pythian phenomena, by means of a drug, for their amusement in telling each other's fortunes. It produces insensibility and ecstasy, in which the mind and the tongue act as in somnambulism. But Nature's resources are not to be limited to drugs, or any other specific employed by human art; she has secret arts of her own.

which it could not surmount without adopting principles of a less complicate nature than those which ignorance always prefers to the simple.

There are some interesting observations on the fall of the republic. Plato had no idea of a universal system. His republic is merely a city with agricultural territory, formed upon the model of the Grecian republics, subject, of course, to the influence of the action from without. But, independent of this action from without, there is a corrupting influence from within, which is capable of overthrowing, according to the Grecian philosopher, the best organized human institutions. Plato demonstrates this point in a very ingenious manner. He says there are five different species of republics—aristocracy, oligarchy, timocracy, democracy, and tyranny. The first is the best, in which the *best* rule. Oligarchy is that in which a party rule. Timocracy, in which the wealthy and powerful rule. Democracy, in which the whole rule, and Tyranny, in which one rules. The aristocratic man is he in whom the best principles maintain the ascendancy. The oligarchic man is he in whom a few insect principles have usurped the ascendancy. The timocratic man is he in whom the love of wealth and honours is the ruling principle. The democratic man is he who is tossed about by every variety of principle, and the tyrannic man is he who is a slave to one domineering principle. An aristocratic man may lose his virtue by ceasing to discriminate between the right and the wrong. Indolence may begin the defection, and the conscience may lose its ascendancy; favouritism may blind the perceptive faculty, and he may fall into an oligarchic state, in which a *set* of principles may retain the hold of his mind. The oligarchic man being led, not by the love of the *best*, but by a party, may fall into the timocratic state by giving way to the love of money, and, having obtained a sufficiency, his mind may become objectless, and irresolute, and dissatisfied with life and all its concerns; it then loses decision, and becomes subject to every variety of impression. In this irresolute state it is very apt to become peevish; Nature makes a violent effort to restore the equilibrium; a master passion is employed for the purpose; the man becomes a drunkard, or a sensualist, or an antiquary—a sportsman, or gardener; and the new ruler absorbs all the interest and devotion of the individual, and tyrannizes over time and purse; over friendships and affluities of every description. The fall of a State is exactly analogous. The best State may fall into the condition of the worst; and anarchy is the next step to tyranny. But it can only fall by the above process. Hence arises a necessity for preventing the first step of the descending scale being taken; for, if ever a departure be made from the righteousness of the pure aristocratic government, in which moral worth dictates to intellect and strength, anger and desire, the fall may go on with small consciousness of descent, until a sudden shock reveal the fact, that we have fallen into a state of irredeemable slavery.

The mode in which this descent may commence, according to our philosopher, is one of the most remarkable ideas in Plato's works. It is perfectly unintelligible to us, and we do not believe any of our readers can understand it; but as it has occupied largely the attention of the learned to no purpose, it may be well to give the celebrated passage entire, as a literary curiosity. Here it is—

"It is indeed difficult for a city thus constituted to be changed, but as everything which is generated, is obnoxious to corruption, neither will such a constitution as this is, remain for ever, but be dissolved. And its dissolution is this. Not only with respect to terrestrial plants, but likewise in terrestrial animals, a fertility and sterility of soul as well as of body takes place when the revolutions of the heavenly bodies complete the periphery of their respective orbs, which are shorter to the shorter lived, and contrariwise to such as are the contrary, and with reference to the fertility and sterility of our race, although those are wise that you have educated to be governors of cities, yet will they never by reason in conjunction with sense, observe the proper seasons, but overlook them, and sometimes generate children when they ought not. But the period to that which is divinely generated, is that which the perfect number comprehends, and (the period) to that which is generated by

man, is that in which the augmentation surpassing and surpassed, when they shall have received *three* restitutions, and *four* boundaries* of things assimilating and dissimilating, increasing and decreasing, shall render all things correspondent and effable, of which the sesquitertian progeny when combined with the pentad, and thrice increased, affords two harmonies. One of these, the equally equal, a hundred times a hundred, but the other of equal length, indeed, but more oblong, is of a hundred members, from effable diameters of pentads, each being deficient by unity, and from two members that are ineffable, and from a hundred cubes of the triad. But the whole geometric number of this kind, is the author of better and worse generations, of which, when our governors being ignorant, join our couples together unseasonably, the children shall neither be of a good genius nor fortunate, and though the former governors shall install the best of them into office, they nevertheless, being unworthy of it, and coming to have the power their fathers had, will begin to be negligent of us in their guardianship; in the first place esteeming music less than they ought, and in the next place the naked (gymnic) exercises."

This incomprehensible piece of philosophy, we pass without comment, only remarking that more danger is likely to arise from the nakedness of the guardians, than from their miscalculations in astrology and geometry. Man cannot be a philosopher, and go naked at one and the same time. Philosophy itself is the ornamental covering of the sensual nature. The very first impulse of the philosophical faculty is to conceal the sensual. This is beautifully illustrated in the story of the tree of knowledge. It can only be by the complete annihilation of sensualism, that nakedness can be tolerated by the philosophical faculty. But the annihilation of sensualism is the annihilation of corporeal being.

* The three-four musical system or diatessaron.

THE TRANSCENDENTALIST'S DIALOGUES. No. VI.

ON "THE ONE."—(Continued from p. 46.)

Transcendentalist.—Materialist.

Mat.—I have been reading an old book about philosophy, and have found two words which seem to bear on the subject of our last discussion. I mean the words "*in potentia*," and "*in actu*," which may be translated "*in power*," and "*in act*." Now, in the statuary's shop which I passed this day, I saw a great lump of marble, which was a statue *in potentia*, but not a statue *in actu*. That is, it contained all the matter requisite for a statue, and was capable of being formed into a statue, though it was not yet a statue, as it had remained untouched by the hand of the sculptor.

Trans.—But how does this bear on the subject of our discussion?

Mat.—Why, look here. I have drawn a line six inches long; now, according to our last discussion, the two halves of this line would not exist until we had performed the act of division; not only was a perceiver required. Even if we perceived the whole line, it would not be sufficient; even then the two halves would not exist, but we must really have performed the act of division by marking with our hands, or, at any rate in our minds, the point which separates one half from the other.

Trans.—I am not sure* that I went quite so far; but, however, I admit all that you say, and am glad to find that you have so consistently followed me out. But proceed.

Mat.—Now, as I was walking home after our last discussion, I was reflecting in myself that the conclusion was very right, that two halves did not exist till the act of division had been performed. But, all of a sudden, I was startled by an apparent absurdity; namely, that though a line six inches in length was existing, neither of its halves were yet in existence—that six

inches were present, while three were not. This seemed like an absurdity.

Trans.—And did you get over this difficulty?

Mat.—Listen! On going home I found the old book before mentioned, and there I found the words "*in potentia*," and "*in actu*,"† and the thoughts suggested by these words solved the whole difficulty. For, thought I, when I say that a line six inches in length, contains two lines, each three inches in length, I mean no more than this:—that if it were divided at a certain point, the two lines between this point and each end of the line, would be found equal to three inches each. In other words, that an undivided whole was two halves *in potentia*, but not *in actu*; and that, on looking at a whole line, we have no more right to say we see the two halves before division, than on looking on a block untouched by the chisel, we have a right to say we see a statue. Therefore, you see I got rid of every absurdity, for I admitted that a line six inches in length was capable of being divided at one cut into two of three inches each.

Trans.—This is capital! We are now not differing at all, but smiling in concert. What you say is true beyond a doubt.

Mat.—Well, but then other thoughts arose. I referred to the first number of the present volume of the *Shepherd*, and found that in our dialogue there recorded, you showed me a piece of wood, and asked me whether it was a single atom, or composed of a number of particles. And I further found, that I replied, "that it was composed of a great number of particles."

Trans.—(Turning over numbers of the *Shepherd*.) Yes, yes, here it is exactly as you say. Go on, for I am extremely anxious to hear the result of your thoughts.

Mat.—Now, it struck me, that I was a great deal too hasty in my use of the word "composed." I thought because by division we should arrive at these small particles, they must necessarily have existed prior to the piece of wood. Here I went too far, for I now find, that though the piece of wood exists, it is quite possible that the particles may never exist till division has been actually performed; whereas, by the use of the word "composed," I dogmatically asserted a prior existence of the particles.

Trans.—What you say strongly reminds me of a remark made by Tichte, in that most difficult book, *Die Thatssachen des Devisstseyns*. He observes (I quote from memory) that when we contemplate a coloured surface and declare it infinitely divisible, when, of course, we have not infinitely divided it, we mean no more than that we can divide it infinitely, and are, in fact, contemplating our own power.

Mat.—Exactly; it is little matter whether we say we contemplate our own capability to divide, or that of space of being divided. Now observe to what I am coming. You remember we called this piece of wood a "one of aggregation;" because its particles were many, and it was merely their union that constituted the one; now I much question whether it has these particles before division takes place, and hence think it probable that it may be a one in the first instance, and that the existence of these particles is secondary.

Trans.—I think I understand you! I conceive you mean, that if I heap these halfpence together, the result will be really an aggregate one, because the existence of every single halfpenny preceded that of the heap. But, on the other hand, you believe that an extended mass may exist, not preceded by what we call its particles; but, on the other hand, that the mass exists first, and the particles afterwards; and not only is the existence of the former necessary to that of the latter, but even an act of division must precede it.

Mat.—You have hit off my meaning to a nicety. Now what think you of my hypothesis?

Trans.—Think, it is a true one, beyond doubt. What a monstrous absurdity would it be to say that the head of Venus was actually in a block of marble before Phidias had touched it! and as all these little particles must have some form or other, it is not less ridiculous to suppose them existing before a

* "I am not sure, &c." The fact is, I am obliged (on account of my limitations of time) to write an article before the previous one is published; hence, the previous one is not before me, and though I can bear in mind the general drift of a particular dialogue, I cannot always remember the force of every individual sentence; hence the words, "I am not sure,"—T.

† The Greek words, of which these are a Latin version, were originally used by Aristotle; they are—"en energia;" "en dunamei."

section is really made. We first see an extended surface, and on cutting that we have the particles.

Mat.—True; and if a common-sense man* said to me, "What infernal nonsense you talk, to admit the existence of the whole, without admitting that of the parts!" I should answer, I do not admit the existence of the whole, without at the same time admitting its possibility of being divided into parts. At which he ought to be satisfied.

Trans.—My dear fellow, if you attempt to satisfy a mere common-sense man, unless you first tire him out by making him contradict himself, you have given yourself a nice job.—But proceed.

Mat.—Now, in the case of this piece of wood, you observe the oneness of the whole precedes the many of the particles. We have a *one* preceding a *many*.

Trans.—Very good; but then you remember that this piece of wood depends for its form (and it cannot exist without form) on other bodies bounding it; hence the existing of the *one* depends on that of the *many*.

Mat.—True; every thing we call *one* is in fact a portion of something larger, and capable of being divided into small particles. This piece of wood is itself but a portion of the universe, and, as you say, a perceiving being must mentally draw a line round it, and stop, to separate it from the rest of the universe. But you see the universe itself is prior to these portions, which are, as it were, cut out of it. Ah, now I have it! The universe is not composed of parts, but parts arise from a division of the universe. Now we have a *one* preceding the many, aye, and a *one* distinct from any oneness in the mind. The universe is itself *one*; and it is no portion of anything, but is the sum total of every thing—the all—the Pan. No need of a perceiver to start from a point, and stop; he may start from where he pleases, and he need not stop at all. The universe is the *one*.

Trans.—We'll discuss that point next time; but I am afraid the universe will disappoint you.

* As this gentleman was a Materialist at first, I have continued to call him by that name. However, he is now really no Materialist at all; he and his friend being a pair of amicable dialecticians.

ANIMAL ARITHMETIC.

MR. McLEAY, in his *Horæ Entomologicae*, has made a very beautiful arrangement of the animal world into five major departments, each of which is divided into five minor departments. The five major are, 1st, *Acrita*, the lowest species, including 1. *Agastria* or *Infusoria*, the very lowest, without either mouth or alimentary canal; 2. *Intestina*; 3. *Polypi natantes*; 4. *Polypi vaginati*; 5. *Polypi rudes*. The 2nd major division is the *Mollusca*, which are especially difficult to arrange, so that he has left two chasms unfilled up; observing, at the same time, that the great fivefold divisions are so clearly established, that the vacancy at present must be ascribed to scientific ignorance. He gives only three classes of *Mollusca*, viz. *acephala*, *pteropoda*, and *brachiopoda*. * * * The 3d division is *Vertebrata*, consisting of *amphibia*, *reptilia*, *pisces*, *aves*, *mammalia*. The 4th division is *Annulosa*, consisting of *ametabola*, *crustacea*, *arachnida*, *haustellata*, *mandibulata*. The 5th division is *Radiata*, consisting of *echinida*, *stellerida*, *medusida*, *acephalida*, *fistulida*.

"It can scarcely have escaped our notice," says Mr. McLeay, "as somewhat remarkable, that each of the great groups appears to be composed of five smaller ones; for, while it may be true, indeed, that, contenting myself with the ability to pass from the *acephala* to the *pteropoda*, by means of the genus *hyale*, I have by no means determined this disposition to hold good among the *mollusca*, still, as it is equally certain that this group of animals is as yet the least known, it may be improper at present to conclude that it forms any exception to the rule. It would even seem unquestionable, that the *gasteropoda* of Cuvier return into themselves, so as to form a regular group; but whether the *acephala* form one or two, such is by no means accurately ascertained, though enough is known of the *mollusca* to incline us to suspect that they are no less

subject in general to a circular disposition than the four other great groups. It may at first be imagined, that each group resolving itself so constantly into five others is an effect which can only be attributed to some accident, which may have favoured this species of development, but there are too many conditions to be fulfilled before we can consider this supposition as in the slightest manner probable. The regularity which is conspicuous in the whole distribution of the animal kingdom, as above given, can proceed from no other cause than design. Whether this regularity be in Nature, or whether it be merely part of an artificial system, which I am now uselessly proposing to the scientific world for their examination, may not, perhaps, be very becoming in me to determine; but I can safely say, that almost all the groups here laid down have been proposed by others, so that in this respect, at least, there will be room for remonstrance, if I should be judged to have wrested the animal kingdom to any theory of my own."

Whatever truth there may be in the above divisions, there can be no doubt that they are strongly corroborated by the five senses, and the five fingers and toes of animals.

We may observe, that the five great circles, which may be represented by five sixpences arranged in a circular form, the highest order being opposite to the lower, are connected by five intermediate classes—*unicata*, *cephalopoda*, *annelida*, *cirripeda*, and *zoanthida*.

EXTENSION OF SOVEREIGNTY.—The government of the democracy brings the notion of political rights to the level of the humblest citizens; just as the dissemination of wealth brings the notion of property within the reach of all the members of the community; and I confess, that to my mind this is one of its greatest advantages. I do not assert that it is easy to teach men to exercise political rights, but I maintain, that, when it is possible, the effects which result from it are highly important; and I add, that if ever there was a time at which such an attempt ought to be made, that time is our own. It is clear that the influence of religious belief is shaken, and that the notion of divine right is declining; it is evident that public morality is vitiated, and the notion of moral rights is also disappearing. These are general symptoms of the substitution of argument for faith, and of calculation for the impulses of sentiment. If, in the midst of this general disruption, you do not succeed in connecting the notion of rights with that of personal interest, which is the only immutable power in the human heart, what means will you have of governing the world, except by fear? When I am told, that since the laws are weak, and the populace is wild; since passions are excited, and the authority of virtue is paralyzed; no measures must be taken to increase the rights of the democracy—I reply, that it is for these very reasons that some measures of the kind must be taken; and I am persuaded that governments are still more interested in taking them than society at large, because governments are liable to be destroyed, and society cannot perish.—*Toequeville's Democracy in America*.

TO CORRESPONDENTS.

R. S.—We wish to devote the Shepherd as much as possible to universal and social subjects; we leave the minor details to publications, whose professed object it is to discuss them. The development of good principles in separate individuals, is not our object; our object is to bring them into action at the same time, by pointing to the mode of association. If two rogues are obliged to live in a house together, they may be tolerably comfortable; but if you convert one of the rogues, you make both miserable. Query, Whether would it be better to convert one of these rogues only, or leave them both in their original state of roguery? Answer, if you convert one only you make an Abel for a Cain to destroy.

The conversation on marriage and animal food we will use, but we must not have too much spirit in one number.

A Universalist we will answer very kindly next week.

A letter for the Transcendentalist lies at the office.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Pantheism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 8, Vol. III.]

SATURDAY, AUGUST 19, 1837.

[PRICE 1½d.

THE PHILOSOPHY OF DESTRUCTION.

I came not to destroy the law and the prophets, but to fulfil.
Jesus Christ.

"LET the flower blow. Do not nip the bud, for you cannot make another." All sound policy in human conduct is in harmony with the general laws of Nature. The process of growth in plants and animals is a graduated succession of states of being. The seed that is sown in the earth *corrupts*, but out of its corruption springs the living germ of its successor. The gay corolla, that constitutes the flower and the bed of vegetation, disappears when the nursing, which it was destined to envelop, has acquired a being, and strength sufficient to resist the action of the elements. As the fruit perishes, the seed within it acquires new vigour, and retains the embryo of a new plant, when the former has submitted to the universal law of decay, which is common to all, but the mineral world, which is the emblem of the Deity.

Nature has established many schools for teaching wisdom (would we only go there to learn), and the great reformers, which have been raised up at different times, have invariably attended these divine institutions, where alone true wisdom can be found. The object of true science is to teach the modes of Nature's working, and thus to present a model for us, the pupils of Nature, to follow; but science too frequently, nay, always, loses sight of the moral end, and contents itself with the names of things, and parts of things, in endless division. When a man has learned botany, as vulgarly taught, he has learned nothing to make him wiser or better. He knows the names of the seven parts of fructification. He knows the different varieties of each. He knows that each species of plant has a fixed number of stamina and stigmata, and according to this number he classes the plant, if he adopt the sexual system of Linnaeus; but if he prefer the system of Jussieu, or of Tournefort, his mode of arrangement is different. But the great object of all these systems is merely to fix and to remember the names of individual plants. The whole science, as taught in the schools, is merely a science of names—a branch of language. It is the letter, but not the spirit of botany. We may say the same of anatomy, or of any other scientific branch of scholastic learning. The moral of science, which is really the only valuable portion of natural knowledge, is entirely overlooked, and the young student is left to teach himself a moral, if he can, or leave his preceptor, untaught, if he cannot.

Yet there is not one of the sciences which may not singly be made instrumental in teaching the sublimest and the most practical truths. It matters little, whether we observe Nature in large or in small systems. In each, the same everlasting simplicity and regularity of system prevails, and perfection in art is that which approaches nearest the simplicity of Nature. When man first attempts to be a painter, he errs not in simplicity, but in complexity; when he paints a tree, he makes each leaf distinct, and spends a world of time on the monstrous deformity, which after all bears no resemblance to a tree. When experience has imparted a little wisdom, he saves both

time and labour by a single sweep of his pencil, and makes the image of a tree, without defining a single leaf that belongs to it. This latter is the most natural method, but it is *always* the last discovered. It is the end and the perfection of art, which ignorance obstinately rejects, until painful experience confront it.

Genius alone discovers the true method, for genius is a son of Nature. It takes lessons from its mother. Accordingly, we find that all great moral teachers have taught by analogy, not by the artificial forms of science, but by the simple logic of Nature, which schools and colleges cannot communicate.—"The wisdom of this world is foolishness with God."—"The wisdom of the wise shall perish, and the understanding of the prudent shall be hid." The wisdom of schools is hard to learn; and when it is learned, the heart is not better, and the mind is only skilled in names of things. The wisdom of Nature is simple and intelligible to all; it is a moral sense, which is developed before science in children, and is more valuable as a guide through life, and as a source of enjoyment.

Christ not only used the parable and the simile as modes of instruction, but he kept up the spirit of the natural processes by opening the flower of the Mosaic religion, instead of destroying the bud. Christianity is distinctly a new religion, in relationship to that of Moses. But Christ was a faithful disciple of Moses, and his disciples were also faithful to the very end of their ministry. "I came not to destroy the law," says Christ; and yet he came to put an end to sacrifices, and ceremonial rites, as religious obligations. "I came to fulfil." "You have seen religion in the bud, ye have seen the green calyx that concealed the corolla; I will open the calyx, and show you the flower. Do not despise the calyx, although now it is of no farther use, since the flower is ready to blow. The calyx was useful in its season, and will yet remain a long time as a base for the flower to rest upon; but the flower is infinitely more beautiful, and the world shall wonder with admiration at its splendour." The flower has come, and the calyx is forgotten, but something more is yet in reserve; the fruit follows next—the subject of enjoyment. The flower is merely an object for the eye to behold—the fruit is a subject for the nourishment of the body. Is it, then, to be wondered at, if Christianity, having escaped from the calyx of Judaism, and bloomed as a flower for an appointed season, should have to encounter a crisis like its predecessor, and become the matrix of a more pure and nutritious system of religion than has yet been taught? Is there any heterodoxy in supposing it? Is there any impiety in believing that a religion can improve, that mankind can become wiser and better, and that the modes of social intercourse, as well as the modes of faith, may all be amended, even supposing they came directly from the dictation of God? Surely the laws of God are wise, and what is wiser than the system observed in those uniform laws of vegetation, according to which, change succeeds change in regular succession, as the plant rises from one state of being to another? Who told thee, O professor of Christianity, that that which now prevails as an established form of religion, under the name of Christ, is the last form in which the growing word of God in man shall appear? Is there any appearance of its perpetuity? Is it a fruit, or

merely a flower; is it a show, or is it really a substance? A conscientious and fearless mind can have little difficulty in answering this question; but the fearful and unbelieving will dogmatically assert that the gospel is really finished, and that we shall never have any other exhibition of truth than that which we now have. He will quote Scripture, too, to prove it. He will remind us of the curse of the Apostle Paul upon himself, or even an angel of heaven, if either should dare to preach another gospel. Simple creature! How can that be another, which grows up out of the same stem? Was Christianity another religion than that of Moses? It looks very different. Yet Christ came not to destroy the law of Moses, but to fulfil it; and may not Christianity undergo a similar change, not for destruction, but fulfilment, yet so thorough, as scarcely even to leave a resemblance of its present dying condition?

Where are now the tabernacle in which God appeared to Moses? the ark, in which the tables of the law were deposited? Where is now the temple of Solomon, in which the sacred fire descended from heaven and consumed the sacrifices appointed by the lawgiver? Where are now the sacrifices, of oxen, and sheep, and calves of a year old, goats and young kids, for the sins of the people? All these were divine institutions, around which the piety of former ages was gathered, and in whose cause enthusiasts buried their swords and their daggers in each others bowels. All gone to the land of forgetfulness. Yes, these were divine institutions. Divine, but not final institutions. The divinity of an institution is no proof of its immutability. The blossom is also divine; but it dies when the fruit begins to show itself. And even the fruit, when it first comes forth from the hand of its maker, comes forth in imperfection, green and sour, and unpleasant to the palate. But it has the principle of growth within it. However perfect it may come forth in its infantine state, it is not perfectly ripe, nor beautiful, nor sweet. It gathers juice, and softness, and plumpness; it clothes itself with bloom, and appears at last as unlike what it was at first, as a drop of water is unlike a hailstone, or a bit of charcoal to a sparkling diamond. Suppose fruits were reasoning beings like men, had faith in God like our modern schoolmen and perverted Christians, and were to reason thus:—"We are divine productions. God made us good, we have no business to change—God made us sour, we have no right to become sweet—God made us green, we have no right to become blooming—God made us hard, we have no right to become soft and plump." Were a grape, or an apricot, or a peach, to reason thus, would not you say they were very foolish fruits? Yet such is the mode of reasoning adopted by the priests and their adherents. It was invented in the Aristotelian schools, and now forms an essential ingredient of political Christianity, and the basis of Christian Conservatism. "Let us remain green, as God made us, says the Conservative, there is danger in innovation; let us avoid the sun that cherishes and ripens us merely to our destruction; we are more able to resist opposition in a hard and sour state, than in a soft and sweet state; let us hold fast to the primitive order of things. It is sinful to change that which evidently was ordained by the will of God." All the sectarians reason in the same manner. They all hanker after primitive Christianity, and the more light they can discover upon the early or green history of the Church, the more confident they are of obtaining the grace divine that will fashion them after the model that alone is from heaven. Green Christians, indeed, they must be, that have made no progress in eighteen centuries; green crabs that hang in the shade, and at last drop to the earth with adamantine firmness.

What is the use of the spirit of God in the Church? Is it not the sun that ripens the fruit? Did not Christ promise to send his spirit to lead us into all truth? He himself did not teach us all. "Whatsoever he heard of the father he told unto us;" but the Church is a ripening fruit, an institution gathering juice and strength, and destined to come to maturity by a process similar to that of vegetation. This ripening process we will reveal. The end of this ripening process we show, and though the end be very different from the beginning, even as sweet is different from sour, still we say that the fruit is the same; the Christianity is the same; the Church is the

same. * We mean not to destroy Christianity, but to fulfil it."

The great distinction between the sour and the sweet Christianity is this, that the sour is a selfish fruit. It tries to convert individuals, instead of attempting to "bring forth a nation at once," according to the Scripture promise. The attempt to make individual Christians, in an unchristian world, is a very preposterous attempt. Such a law as that of Christ's is not to be kept by individuals. It never has been kept. It is not even taught. We give the sour fruit of priestcraft credit for perceiving that the law of Christ can not be taught literally. It must be accommodated to the kingdom of Satan—a compromise must be made with the devil, whose kingdom the parsons have agreed to defend upon Conservative principles, and perverted the meaning of Christ's law to dove-tail with the robbery and oppression of Christ's greatest opponent. It is a curious treaty, and most sanctimoniously is the compact between Christ and the Devil defended by the successors of Peter and the Apostles. One would suppose, to hear them preach, to see their mimic gesticulations, and listen to their musical intonations, into which are artfully woven the sacred phraseology of selfishness—"the *peculiar* people—the *elect*, the *chosen* people—called out from amongst the wicked world—*predestinated* to glory,"—and all the other pleasing ideas which give consolation to the unripe fruits, by encouraging the hopes of preferment, superiority, power, which are ever connected with the corresponding opposite ideas of a reprobate people, a doomed people, an inferior people, to whom wrath is fore-ordained;—one would suppose, we say, to hear and witness all this ostentatious display of piety and love, that there was really some reality in it. But the very book respecting which all this cant is employed, has taught us that all this ostentatious display is merely Luciferian—it is the shadow of a brighter substance—it is the outward expression of a love which is not yet realized, because the fruit is not ripe; but a love which will be realized by the general adoption of the Christian principle of social love, as the plan decreed in the councils of eternal wisdom for bringing forth a nation at once, and destroying the power of Satan by a *coup-de-main*.

"For the law," says an Apostle, "having a shadow of good things to come, and not the very image of the things, could not, with those sacrifices which they offered year by year continually, make the comers thereunto perfect. For then would they not have ceased to be offered? Because that the worshippers once purged, should have had no more conscience of sins."¹ This is admirable reasoning. If a man is once fairly purged from guilt inwardly, he is no more conscious of being guilty; he is no longer fearful of the punishment of guilt. Has the death of Christ removed this consciousness of guilt? We have put this question to many professing Christians, and we invariably receive for answer, that they are great sinners. One not long ago, told us that he believed God would be justified in sending him to hell for ever, for the sins he had committed. We told him he must be a dangerous character in human society; and that if God were justified in sending him to hell, surely the law would be justified in sending him to the *hangman*. He would not admit this conclusion! It is the character of professing Christians to acknowledge their guiltiness. It is a striking feature of Evangelism, and no Christian or religious sect is without the guiltiness of conscience. Such people are not saved. The Redeemer has not come to them. We can conscientiously say that we have no such load upon us; we once had; but, like the pilgrim who fled from the city of destruction, we laid it all upon the Saviour's back, and we have nothing farther to do with it. "Cast your burden upon the Lord;" we have done so and *will* do so. We have no guilt, our conscience is clear, it is purged in so far as it respects our relationship with God. And now we boldly say, that God is not justified in sending us to hell. We demand an acquittal at the bar of Heaven, and in doing so, we only follow the Scripture advice, to come boldly unto the throne of grace, and into the holiest of all. The flesh Christians cannot do this, *because* the conscience is not purified by flesh and blood.

* Heb. x.

THE TRANSCENDENTALIST'S DIALOGUES.
NO. VII.

ON "THE ONE."—(Continued from p. 56.)

Transcendentalist.—*Materialist.*

Trans.—We are now going to extend our enquiries even to the universe; and first let me make a few remarks. Whatever object is presented to us, is, as we have already seen, a one, which is resolvable into a many; by a process of reasoning we come to the one, which we have called an ultimate particle, but this same particle is never manifested to our senses; and in our former dialogues we discover, that even if we try, by dialectic investigations, to find out its properties, it leads us to a contradiction. There was no sophistry, no play upon words, used in our pursuit. If we admit the existence of an object in space, (as *e.g.* the piece of wood,) in the absence of all perceivers, we must, at the same time, admit the atom. For if we say, there is no ultimate particle, our whole edifice falls to the ground; the theory of infinite division of any body, leads to the non-existence of that body.

Mat.—Aye, by the bye, let us consider that point; we have not yet investigated the theory of infinite division.

Trans.—Why, the upholders of that would suppose this piece of wood to be composed of particles, which particles are composed of other particles, and so on, *ad infinitum*. Now composition cannot be called an essential attribute of substance, but merely expresses the relation in which several substances stand. And yet, by making division infinite, you have no self-stability—you come to no self-existing one—but composition seems the very condition on which the compounded particles exist.

Mat.—I see now the result of our dialectic. If you say this piece of wood has no ultimate particle, you have taken away the very foundation of its existence. If, on the other hand, we admit ultimate particles (or atoms), we are involved in the contradictions exhibited in our former dialogues. This seems odd, that we are wrong whether we admit an hypothesis, or the reverse of that hypothesis. How is it?

Trans.—Because the assumption we set out on was wrong; we assumed this piece of wood as an object existing independent of a perceiving being, which was the very thing we had no right to assume. This piece of wood occupies but a portion of space—it is itself but a portion of the mass of sensible objects—hence (*Dial. v.*) there is need of a perceiver to constitute it. The perceiver constitutes it by mentally drawing a line round it. Its very existence as a separate object depends on that act. Now the ultimate particle we used to talk about, we never even saw, much less did we draw a line about it. But the existence of a portion depends on its being apprehended. And as the atom cannot even be seen, of course it cannot exist (I mean, exist in a separate state). When talking of the qualities of an atom, we are talking of a thing whose very existence is impossible; and when we talk of an infinite division, we talk of an impossible act, for no period of time, however large, would suffice to perform it. Hence, when we talk of the attributes of impossible matters, what can you expect but impossible results?

Mat.—I now see all. If we talk of this piece of wood as existing independently of perception, we must suppose it composed of atoms, and that these atoms are the conditions of its existence; but if we admit that a portion cannot exist without the presence of an intelligent divisor, of course we cannot suppose that an atom, or a particle so minute as to be imperious to the view of any one, exists at all. And even if there were microscopes powerful enough to exhibit this small magnitude, still it would be the intelligent perceiver alone who could declare it a separate thing from the surrounding bodies, and in fact, endow it with a separate existence.

Trans.—Yes; and now look straight before you. You see this table, and you see that it is bounded on all sides; that which bounds it you expect to be bounded by something further, this house has its bounds, on each side it is bounded by other houses, at the bottom by the ground, above by the atmosphere. Set a bound where you like, you must comprise those bounds in further bounds.

Mat.—Yes, I see you must go on till you arrive at the universe.

Trans.—And now observe, our proceeding will be the reverse of what it has hitherto been. Every object, we apprehend, occupies but a portion of space. In our attempts to arrive at an atom we have divided an object, or rather tried to investigate the result of a division. A whole was given (*i. e.* a whole in respect to its own particles), and we inquired respecting the quality of its parts. Now we consider the object no longer as a whole, but itself merely a part of the mass of sensible objects—every given mass is a portion of a larger mass—and so on. The universe is no object present to the senses, nor is it a series of sensible phenomena which have been present to us successively, and have since been apprehended by the understanding. Like the atom, we arrive at it by a process of reasoning; only in the former pursuit we inquired what would be the ultimate result of division, now we inquire what would be the ultimate result of addition. The atom is the ultimate particle, the universe is the ultimate total.

Mat.—Exactly.

Trans.—And as we first inquired whether division was infinite or not, we must now inquire whether addition is infinite or not.

Mat.—We must.

Trans.—Do you remember our old Axiom? Every word that has not a signification is sheer nonsense?"

Mat.—I do.

Trans.—"Universe," therefore, if it be not a mere unmeaning sound, has a corresponding signification.

Mat.—"Universe," means the sum total of sensible objects: I say, sensible objects, in contradistinction to such beings as many of the religious world affirm not to be manifest to the corporeal senses.

Trans.—The universe, as we have said, is never present to the senses at once. Nay, it even requires a considerable time to apprehend a portion a mile or two in extent. Take a walk from Charing Cross to Whitechapel church, and observe what a variety of objects you must collect together to bring all you have passed through to a one.

Mat.—But why bring them to a one?

Trans.—Why we have to add objects together to arrive at the universe, and what is adding but bringing to a one. In the common process of counting, you say 1, 2, that is *one* brought into one sum, with the previous one, 3, that is to say another *one* brought into one sum, with the sum previous to that; thus you see addition is successively bringing several objects to a one.

Mat.—Yes, I see now.

Trans.—Well, if the number of sensible objects be infinite, how can we ever complete our addition? The Universe is, as you say, a sum total, but how can we arrive at a sum total without completing our addition? You see an infinite universe is a word altogether without meaning for us. The universe is the aggregate of all sensible things; if we never arrive at this aggregate, it is nothing for us, and hence we might as well strike the word "universe" out of our vocabulary, if we attach to it the word, "infinite."

Mat.—Stay, let us look a little further into the requisite Synthesis, or adding process. Now a man has a very clear conception the meaning of the words "fifty miles," and yet if he performs a journey of fifty-miles, he does not collect into one view every pebble that happens to lie on the road. On the contrary he forgets many objects which attracted him at the beginning, of his journey. Thus it may be with the universe; we may not be able to bring before us, and successively add to our heap every lump of dirt in the world, but still we may be able to apprehend a sum total, as the man apprehends the fifty-miles without remembering what occupied every inch of the road.

Trans.—The cases are quite different. A man may walk on at a regular pace without looking at anything but his watch, and still apprehend fifty miles, signifying by a mile that distance which he can walk in a quarter of an hour. Or, if he puts faith in road surveyors, a mere counting of mile-stones will suffice. I do not require you to see every pebble. Take in worlds, systems at a glance, if you like, still if the things to be added are infinite in number, you will arrive at your task,

no sooner by adding thousands than units. I much suspect, that as we found both the finite and infinite division lead to absurdity, so we shall find ourselves puzzled by a finite or infinite universe. Good bye! Of the *finite* universe hereafter!

Erratum, p. 55, 2nd col. line 41, for "Tichte" read "Fichte."

THE SATAN OF THE POETS AND THE PRIESTS, COMPARED WITH THE SATAN OF NATURE.

(Concluded from No. 7.)

THE following is the reply of the Messiah of Heraud to the plea of Satan:—

— Right royally, serenely bright,
High on his winged chariot, paved with love,
Life its foundation, and its pillars light,
Peace for its canopy, o'er arched above,
Messiah, patient, heard the insensate plea
Wherewith the arch-apostate, wrathful, strove.
"Satan," thus spake the judge, "ere asked of thee
On the thick bosses of my buckler thou
Hurlst thy defence of ire, impetuously.
Thou knowest not the Father; but I know.
Thou hast not been his counsellor. To thee,
Say when to thee, did he his secrets show?
Where wert thou when he spake, begetting me
His word, and breathed his spirit infinite
Through the far echoes of eternity? &c. &c.

This claim of hereditary privilege, and native superiority in the Messiah, is kept up for a considerable time: we lose nothing of the force of the appeal by proceeding at once to the primitive state of the fallen angels.

"Gods were ye, each one to himself approved;
Divinest, *swayed by no intelligence*;
Superior, wisest, mightiest, self-emoved,
Each rested in his own magnificence,
Incapable of brighter, till the Sire
Made manifest a higher excellence;"

that is, till God brought forth the Messiah, and set him above the highest of his elder brethren. The principle is philosophically correct that the last is superior in wisdom to the first. It is also philosophically correct, that past, or first-born time, sinks into hell or forgetfulness; but the present, or eternally begotten time, lives in everlasting light. There are many other senses in which the Mythos of Satan and Messiah is beautifully correct. But when these principles are personified, and when the past becomes a hell of torture to a sensitive being, and the present a heaven of glory to a royal undefectible favourite, Humanity revolts at the thought. Justice repels it with indignation; and treats the sophistry of the schools by which it is defended, with the contempt it deserves. Satan envied the promotion of this younger son of heaven.

"Law proved thy love *defective*, faith *unsound*,
Will *rebel*, to the voice of the Supreme."

"Who made them so?" will be re-echoed to eternity by every thinking mind. "He hath mercy on whom he will have mercy, and whom he will he hardeneth," is genuine philosophy, but it is a philosophy that will not admit of hell-fire and misery. The moderate distribution of pain in this world is not inconsistent with benevolence, because it is an incentive to action; and, consequently, the hardening of the heart, as a means of creating pain and social and political activity, is perfectly justifiable; but when you send the poor creature whose love was *defective*, faith *unsound*, and will *rebel*, to hell, black fire, and horror eternal, because he was a hardened vessel, there is no logic in the universe to justify you. It is fearful blasphemy to assert it, reckless impiety, the scorn of the world to come. We would rather have all the iniquity of all the atheists and infidels of eternity upon our conscience, than carry such a fearful pilgrim's load. But Mr. H. is in good company, and even

we do not condemn him. The God of the *Shepherd* is not such an Inquisitor, that we must become monks Dominican.

Messiah even taunts Satan with his poverty and misery:—

— Look around,
"Thy place is of thy spirit!" "Let it be!"
Impatient of reproof, thus Satan said:
"It is as I—but who created me?
His is the wrath and fury, who hath made
The vessel for them. So he loves not me,
Nor these who dwell with me in this thick shade;
He is not love to all if love to thee."

How gentle! how angelic! how intelligent! Messiah then tells Satan that he was made free to stand or fall. How this consorts with St. Paul's doctrine, only the schoolmen can tell, but the scholars cannot understand them; and what is equally singular, the Messiah himself is equally free to fall, but will not to all eternity—because it is decreed he shall stand:—

— Other bond have I
None, with the Father, but obedience whole.
The Son returns to all eternity
Entire obedience to the Father's will," &c.

How can we wonder at the progress of infidelity in an age of thought, when the whole mass of human intellect is sunk in the gloomy caverns of a mythology so dark and unfathomable as this? Thanks to the colleges! Moses and the Prophets had no such notions. Happy men! Happy, indeed, is the people who can refer all things that are, and all events that occur, to the superintendence of a just and a wise being, who has seen proper to create a certain amount of evil, but whose justice will never suffer a creature to carry more than its nature can bear, and who will ultimately remove the load of misery, and give joy for mourning, the garment of praise for the spirit of heaviness.

But who and what is the Satan of Nature? It is the God of Nature working by antagonism, or through the selfish principle. It is not evil necessarily; but the selfish principle, in ignorance, produces animosities, which animosities can only be removed by a social union, and then the mass of separate beings, being actuated by one sympathetic spirit, is like unto God, in unity. The contentions work out this final result, in showing the evil of selfishness by experience. Satan, therefore, is the spirit of law and bondage, which brings us to liberty, that is Christ. Christ teaches us how to terminate the reign of Satan, by fraternal love and social community. It is for this reason that he is called the Messiah, because nothing else can save the world from contention but this spirit of communion, or crucifixion of self. The voluntary death of the founder of Christianity is a type of this great spiritual crucifixion, which is required of the Church before it can be saved. The death of Christ's body has inflicted no wound upon the reign of Satan. It has strengthened it, by the Church resting on a false basis; but the spirit of Christ imparted to the Church, and acting in a social capacity for the universal good, and giving up all that belongs to self, in order that the great body of the Church may be firmly united in love, is the true and the only saviour which man can ever have. The victim is Satan, and when self is crucified in this social manner, it rises again into newness of life more glorious than ever; for the new social state will not diminish, but infinitely increase, the happiness of the individual being. Satan is, therefore, at his destruction, transformed into an angel of light. There is no difficulty in understanding the fall and redemption of man, by regarding it as the connected plan of one great presiding spirit. But to set a Messiah over one selfish department, and a Satan over the other, and give each party a sect in society, is to open a sluice of delusion to inundate the world of thought.

Satan is not so evil that he is not admitted into heaven. The Lord sent a devil direct from heaven to deceive Ahab. In the book of Job, Satan is represented as taking a walk into heaven, and holding a free and easy conversation with God himself. Michael durst not bring against him a railing accusation. He is a sovereign prince, and reigns till the social principle supercedes the selfish. If, then, the poets and the priests really do wish to overcome Satan, instead of venting their elo-

quent abuse upon an ideal personage, who has no such local existence and habitation as they dream of, they ought to direct the inspiration of the muse, and the gifts of the Holy Spirit, to the advocacy of a religious or social system,* and thus subdue Satan in human society. But the wisdom of schools and colleges never dreams of this great work: it is wholly taken up with abstract propositions and poetical prosopopeias. It knows not God; it cannot analyse the Divine Nature, and discover the double personality. Though it attempts to demonstrate his infinite attributes, it invariably overlooks the negative department of his nature. It shows the light, but conceals the darkness, which is the most sublime feature of the Deity; and all the attributes of darkness are overlooked with the great and unfathomable abyss of obscurity and grandeur which involves them. Until this great abyss of divinity is penetrated, sectarianism must desolate the earth, and fill the bedlams of society. We must, like Christ, descend into hell, and deliver the spirits which are there imprisoned by the fear of God and Satan. We do not require to go far for this purpose. Hell, like heaven, is within us; it is in the mind; there is the lake, there is the prince of darkness, there is the fire; there also is the prisoner. This prisoner we must deliver—deliver by what means? by showing him his Redeemer in the pit; and what is this Redeemer, but such a reasonable view of the Divine Nature as will destroy the fear of God and Devil for ever. Fear is the slavery which makes the fearful religions of the world a hell upon earth. "And the fearful and unbelieving are cast into the lake of fire." Christ was sent "to destroy the works of the Devil, and deliver them who, through fear of death, were all their life-time subject to bondage:" but Christ has only come outside, he has not yet come into the heart. This heart—Christ is the true and the only Saviour. The whole work of atonement and resurrection, that was performed in Jerusalem, is but a type of that which must be performed in the heart of every member of the Church individually, and in the Church socially, as a body politic.

The mythos of Satan and Christ is the most sublime of all subjects for an epic poem. It will yet immortalize the man who fairly delineates it. There are several ways in which it might be done. We will suggest one. Let Satan be the representative of the present system of society. Let him be an intelligent, vigorous, humane, well-meaning, contented spirit, who maintains, with all the powers of language, and all the eloquence of poetry, the necessity of gradations in wealth amongst individuals, the wealthier ruling the poor, keeping them in subjection by the fear of punishment, both in this world and the next, and inculcating moral and religious lessons of obedience to the laws, respect for property, and patient submission to the afflictive dispensations of Political Providence. Let the character be perfectly sincere, untainted with hypocrisy, thoroughly convinced of his own rectitude, and the infallibility of his philosophy. On the other hand, let the Messiah adopt the social view of the question; let him insist upon the voluntary humiliation of the rich—the brotherly co-operation of all for the good of all—the universal education of mankind in the principles of honour—the government of society by love, rejecting the doctrine of eternal torture, and adopting merely the simple responsibility of Nature, which punishes evil in every well-cultivated mind by the moral instrument of social intercourse. Let the two parties contend with fair argument, by intellect, which is the sword of the spirit; not with words, and guns, and thunderbolts, and other Hotspur instruments, except through the instrumentality of half-tutored men. Such unholy weapons are degrading to the character of a moral being, but

* It is only as a social principle that we advocate the cause of religion. We do not admire the sour sectarianism of the world; neither do we admire that selfish spiritualism which retires within itself, and pretends to enjoy intercourse with God, whilst it alienates itself from society. "He that says he loveth God, and loveth not his brother, is a liar, and the truth is not in him." "Religion" comes from the Latin verb, "religo," to bind together. It is higher than spiritualism, as sociality is higher than selfishness. False religion is selfishness—true religion is social love.

are the only tribunal to which the ignorant can appeal, and would constitute a field sufficiently spacious to give romance and interest to the poem.

Were this plan adopted, it would be found that the greatest proportion of the clergy would range themselves on the side of Satan, and Christ would have the poor and the simple-minded only. Yet this is a right reverend and orthodox statement of the case, and by no means at variance with the character of Satan as portrayed in the Bible, whilst it is as practical a personification of the Satan of Nature, as can well be imagined. We heartily wish that the muse would inspire some one to sing such a song before we go hence, and be no more. Byron and Goethe have done much to prepare the way for such an epic. The Lucifer of Byron is a splendid character. But the motive or object of his wickedness is not such as ought to characterise the Satan of nature, who must be represented as acting always upon the principle of doing evil that good may come. The prologue to Faustus by Goethe, is a paraphrase upon the book of Job—the devil is in heaven talking freely with God, and receiving a commission to tempt the Doctor—but, although, he justly complains the evils of human life, and expresses his disaffection with the system prevailing in society, there is a low vulgarity about him, which throws his opinions into contempt. Perhaps the prologue to Job is the closest approximation to a correct drama of God and Devil that the spirit of poetry has on record. It is astonishing that the epic genius has not pursued the idea. It can only be accounted for by the corruption of the schools of Theology and of the public taste. The Satan of Job is neither a liar nor a fiend; he tries Job, to see if he would curse God in Poverty. The victory is fairly divided between Satan and God; Satan says 'take all that he hath, or touch his bone and his flesh, and he will curse thee to thy face.' This was done. "After this, Job opened his mouth and cursed his day." He who curses his day, curses the providence of God, and God himself. "He who sweareth by heaven, sweareth by the throne of God, and by him who sitteth thereon." There is a chastity and delicacy about the "prologue in heaven of the book of Job," which it requires "not talent but taste," in our modern poets to exceed.

SCHISM AMONGST THE AMERICAN PRESBYTERIANS.

For some years past there has been a violent contest between an old and a new party, in the Presbyterian union in the United States. This has at last terminated by the excommunication of the minority, consisting of about 600 congregations, by the majority, consisting of about 2,400 congregations. The corruptions complained of, are traced by the General Assembly to the "wide spread and ever restless spirit of Radicalism." The following is the testimony of the Assembly on this point, contained in a general epistle to all the churches of Jesus Christ:—

"One of the most formidable evils of the present crisis is, the wide-spread and ever restless spirit of Radicalism, manifest both in the Church and in the State. Its leading principle, everywhere, seems to be, to level all order to the dust. Mighty only in the power to destroy, it has driven its deep agitations through the bosom of our beloved Church. Amidst the multiplied and revolting forms in which it has appeared, it is always animated by one principle. It is ever the same levelling, revolutionary spirit, and tends to the same ruinous results. It has, in succession, driven to extreme fanaticism the great cause of Revivals of Religion, of Temperance, and of the rights of man. It has aimed to transmute our pure faith into destructive heresy; our scriptural order into confusion and misrule. It has crowded many of our churches with ignorant zealots and unholy members; driven our pastors from their flocks; and with strange fire consumed the heritage of the Lord, filling our churches with confusion, and our judicatories with conflict; making our venerated name and beloved institutions, so far as its fearful influence extends, a hissing and a by-word before the American people; and even threatening the dissolution of our national union, as well as the dismemberment of the Presbyterian Church."

Such is the work of demolition, even in America, the land of promise to our British Radicals; but a land of fanatics and gripping money-mongers, notwithstanding. We are glad to see the tower of Babel falling—the legs of the image, partly iron, and partly clay, crumbling to pieces. The kingdom of the beast is to fall “without hand,” that is to say, it must fall by its rottenness; it comes apart like a statue made of wet sand, when the sun sheds a few rays of genial warmth upon it. Our readers will, no doubt, be curious to know what these corruptions of doctrine are, which have separated the six hundred congregations from their former allies. They are contained in the following sixteen heterodoxies:—

1. That God would have prevented the existence of sin in our world, but was not able, without destroying the moral agency of man; or for aught that appears in the Bible to the contrary, sin is incidental to any wise moral system.

2. That election to eternal life is founded on a foresight of faith and obedience.

3. That we have no more to do with the first sin of Adam, than with the sins of any other parent.

4. That infants come into the world as free from defilement, as was Adam, when he was created.

5. That infants sustain the same relation to the moral government of God as brute animals, and their suffering and death are to be accounted for on the same principles as those of brutes, and not by any means to be considered as penal.

6. That there is no other original sin than the fact that all the posterity of Adam, though by nature innocent, or possessed of no moral character, will always begin to sin when they begin to exercise moral agency; or that original sin does not include a sinful bias of the human mind, and a just exposure to penal suffering; and that there is no evidence in Scripture that infants, in order to salvation, do need redemption by the blood of Christ, and regeneration by the Holy Ghost.

7. That the doctrine of imputation, whether of Adam's sin, or Christ's righteousness, has no foundation in the Word of God, and is both unjust and absurd.

8. That the sufferings and death of Christ were not truly vicarious and penal, but symbolical, governmental, and instructive only.

9. That the impenitent sinner is by nature, and independently of the renewing influence or almighty energy of the Holy Spirit, in full possession of all the ability necessary to a full compliance with all the commands of God.

10. That Christ never intercedes for any but those who are actually united to him by faith; or that Christ does not intercede for the elect until after their regeneration.

11. That saving faith is the mere belief of the word of God, and not a grace of the Holy spirit.

12. That regeneration is the act of the sinner himself; and that it consists in a change of his governing purpose, which he himself must produce, and which is the result, not of any direct influence of the Holy Spirit on the heart, but chiefly a persuasive exhibition of truth, analogous to the influence which one man exerts over the mind of another; or that regeneration is not an *instantaneous act*, but a progressive work.

13. That God has done all that he can for the salvation of all men, and that man himself must do the rest.

14. That God cannot exert such influence on the minds of men as shall make it certain that they will choose and act in a particular manner, without impairing their moral agency.

15. That the righteousness of Christ is not the sole ground of the sinner's acceptance with God; that in no sense does the righteousness of Christ become ours.

16. That the reason why some differ from others in regard to their reception of the gospel is, that they make themselves to differ.

Such a curious hodge-podge of truth and absurdity we have not often witnessed; but we forego any critical observations at present, leaving our readers to form each a judgment for himself on the condemned articles.

In some of the resolutions (says the *Scottish Guardian*) adopted by the convention of the orthodox party, the extravagancies and errors to which Radicalism has led, are more distinctly pointed out. They complain of the following disorders:—

“The disorderly and unseasonable meetings of the people, in which unauthorised and incompetent persons conducted worship in a manner shocking to public decency; in which females often led in prayer, and sometimes in public instruction; the hasty admission to church privileges, and the failure to exercise any wholesome discipline over those who subsequently fell into sin, even of a public and scandalous kind; and of these and other disorders, grieving and alienating the pious members of our churches, and so filling many of them with rash, ignorant, and unconverted persons, as gradually to destroy all visible distinctions between the Church and the world.

“While many of our ministers have propagated error with great zeal, and disturbed the church with irregular and disorderly conduct; some have entirely given up the stated preaching of the gospel, others have turned aside to secular pursuits, and others still, while nominally engaged in some part of Christian effort, have embarked in the wild and extravagant speculations which have so remarkably signalized the times, thus tending to secularize and disorganize the very ministry of reconciliation.”

The Assembly (continues the same *clerical* paper), in their General Epistle, part of which we have cited above, have published the following excellent testimony, with which we must close our account of the proceedings:—

“As the great truths of the gospel lie at the foundation of all Christian hope, as well as of the purity and prosperity of the Church, we felt ourselves bound to direct early and peculiarly solemn attention to those doctrinal errors, which, there was but too much evidence, had gained an alarming prevalence in some of our judicatories. The advocates of these errors, on their first appearance, were cautious and reserved, alleging that they differed in words only from the doctrines as stated in our public standards. Very soon, however, they began to contend that their opinions were really new, and were a substantial and important improvement of the old creed of the Church; and at length, that revivals of religion could not be hoped for, and that the souls of men must be destroyed, if the old doctrines continued to be preached. The errors thus promulgated were by no means of that doubtful or unimportant character which seems to be assigned to them by some of their professed friends of orthodoxy. You will see by their published acts, that some of them affect the very foundation of the system of Gospel truth, and that they all bear relations to the Gospel plan of very serious and ominous import. Surely doctrines which go to the formal or virtual denial of our covenant relation to Adam; the native and total depravity of man; the entire inability of the sinner to recover himself from rebellion and corruption; the nature and source of regeneration; and our justification solely on account of the imputed righteousness of the Redeemer, cannot, upon any just principle, be regarded as “minor errors.” They form, in fact, “another Gospel;” and it is impossible for those who faithfully adhere to our public standards, to walk with those who adopt such opinions with either comfort or confidence.

“It cannot be denied, indeed, that those who adopted and preached these opinions, at the same time declared their readiness to subscribe our Confession of Faith, and actually professed their assent to it in the usual form, without apparent scruple. This, in fact, was one of the most revolting and alarming characteristics of their position. They declared that in doing this, they only adopted the Confession “for substance,” and by no means intended to receive the whole system which it contained. Upon this principle, we had good evidence that a number of Presbyteries, in the ordination and reception of ministers, and other church officers, avowedly and habitually acted. And hence it has not been uncommon for the members of such Presbyteries publicly and formally to repudiate some of the important doctrines of the formulæ which they had thus subscribed; and even, in a few extraordinary cases, to hold up the system of truth which it contains, as “an abomination;” as a system which it were to be “wished had never had an existence.” No wonder that men feeling and acting thus, should have been found, in some instances substituting entirely different confessions of faith in place of that which is contained in our constitution. Who can doubt that such a method of sub-

scribing to articles of faith is immoral in principle; that it is adapted to defeat the great purpose of adopting confessions; and that, if persisted in, it could not fail to open the door of our church wider and wider to the introduction of the most radical and pestiferous heresies, which would speedily destroy her character as an evangelical body?"

We shall only observe of this subscription to this formal Confession of Faith, that it is in perfect accordance with the conduct of Christ and his Apostles, who subscribed to the outward form of the law, whilst they attempted to supersede the letter with the spirit. We ourselves have no objection to subscribe the Confession of Faith, we could do it most conscientiously, but having done it, we could not conscientiously preach the "letter" as taught and understood by the Church. We should insist at all times on the spirit and substance of religion being superinduced upon a mere formal observance; and the substance of Christianity differs as much from its priestly caricature, as the Christianity of the priest from the religion of Moses and Aaron.

INDIAN PROPHET.

TO THE EDITOR OF THE SHEPHERD.

SIR,—Your quotation in No. 5, page 34, from the *Hickate American* publication, to the effect that "the natives (Indians) have a higher sense of this divine light in the soul than the professors of Christianity generally have," receives a curious confirmation from the notes of an honest zealous sectarian, who viewed such manifestations as wild fancy, or the works of the devil. His solution of the difficulty, by seriously attributing the origin to Satan, must be admirable in the eyes of the natural Christian and mechanical philosopher. The witness being respectable, while he rejects the true source of the phenomenon, makes his evidence of the fact of double weight. If the account is not too well-known, perhaps you may use the following extract, which I made some time ago, and indulge the public with your comments. I believe the book was printed in America.—Yours respectfully,

August, 1837.

Extract from the Diary of David Brainerd, Missionary to the Indians in the years 1742 to 1747, when the present United States was a Colony of Great Britain, and almost entirely a wilderness.

"What increases their (the Indians) aversion to Christianity is the influence their powwows have upon them. These are supposed to have a power of foretelling future events, of recovering the sick, and of charming persons to death. And their spirit, in its various operations seems to be a satirical imitation of the spirit of prophecy, that the church in early ages was favoured with.

"I have laboured to gain some acquaintance with this affair, and have for that end, consulted the man mentioned in my journal, of May 9, who, since his conversion to Christianity, has endeavoured to give me the best intelligence he could of this matter. But it seems to be such a mystery of iniquity that I cannot well understand it; and so far as I can learn he himself has not any clear notions of the thing, now his spirit of divination is gone from him. However, the manner in which he says he obtained this spirit was, he was admitted into the presence of a great man, who informed him that he loved, pitied and desired to do him good. It was not in this world that he saw the great man, but in a world above at a vast distance from this. The great man, he says, was clothed with the day; yea, with the brightest day he ever saw; a day of many years, yea, of everlasting continuance! this whole world, he says, was drawn upon him, so that in him the earth and all things in it might be seen. I asked him, if rocks, mountains, and seas were drawn upon him, or appeared in him? He replied, that every thing that was beautiful and lovely in the earth was upon him, and might be seen by looking on him, as well as if one was on the earth to take a view of them there. By the side of the great man, he says, stood his shadow or spirit. This shadow, he says, was as lovely as the man himself, and filled all places, and was most

agreeable as well as wonderful to him. Here, he says, he tarried some time, and was unspeakably entertained and delighted with a view of the great man, of his shadow or spirit, and of all things in him. And what is most of all astonishing he imagined all this to have passed before he was born. He never had been, he says, in this world at that time. And what confirms him in the belief of this, is, that the great man told him that he must come down to earth, be born of such a woman, meet with such and such things, and in particular that he should once in his life be guilty of murder. At this, he was displeased, and told the great man he would never murder. But the great man replied, "I have said it, and it shall be so." Which has accordingly happened. As this time, he says, the great man asked him what he would chose in life. He replied, first to be a hunter, and afterwards to be a powwow or diviner. Whereupon the great man told him that he should have what he desired, and that his shadow should go along with him down to earth, and be with him for ever. There was, he says, all this time no words spoken between them. The conference was not carried on by any human language, but they had a kind of mental intelligence of each others' thoughts. After this, he says, he saw the great man no more; but supposes he came down to earth to be born, but the spirit or shadow of the great man still attended him, and ever after continued to appear to him in dreams and other ways, until he felt the power of God's word upon his heart, since which it has entirely left him.

This spirit, he says, used sometimes to direct him in dreams to go to such a place and hunt, assuring him he should there meet with success, which accordingly proved so. And when he had been there some time, the spirit would order him to another place. So that he had success in hunting, according to the greatman's promise, made to him at the time of his choosing this employment.

There were some times when this spirit came upon him in a special manner, and he was full of what he saw in the great man; and then, he says, he was all light, and not only light himself, but it was light all around him, so that he could see through man, and know the thoughts of their hearts. These depths of Satan I leave to others to fathom, and do not know what ideas to affix to such terms, nor can guess what conceptions of things these creatures have at the times when they call themselves all light. But my interpreter tells me that he heard one of them tell a certain Indian the secret thought of his heart, which he had never divulged. The case was this: The Indian was bitten with a snake, and was in extreme pain; whereupon the diviner (who was applied to for his recovery) told him, that at such a time he had proposed, that the next deer he killed, he would sacrifice it to some great power, but had broken his promise. And now, said he, that great power has ordered this snake to bite you for your neglect. The Indian confessed it was so, but said he had never told anybody of it. But as Satan, no doubt, excited the Indian to make that promise, it was no wonder he should be able to communicate the matter to the conjurer." [No wonder at all.]

FORMATION OF WOOD AND FLESH.—The circulation of sap in trees proceeds upon the same principle as the circulation of the blood in animals. The sap rises from the root by one set of vessels, and descends from the leaves by another set of vessels. In the leaf this sap undergoes a peculiar change by the action of light and heat. This change is indispensable for its nutritive or lignifying virtues. When stripped of leaves, the branches cease to grow. It is on this account that growth ceases in winter, even when the life of the tree is preserved. This juice returns between the wood and the bark, and forms what is called the alburnum, or new growth of wood, of a soft substance. This alburnum becomes hard during winter, and forms a sort of layer above the growth of the former year, so that the age of a tree can be easily determined by the number of concentric rings perceived in a transverse section. The age of any particular branch may be determined in a similar manner. This fact in reference to trees, leads us by analogy to determine the difference between arterial and venous blood in animals. It is often asserted that arterial blood being the purest is the most nutritive, and that the veins contain merely

the refuse of the circulating fluid; but the veins are the returning vessels of the animal system, and it seems most probable that the change which the blood undergoes at the extremities of the vessels, by the action of heat and light upon the skin, is of a nature corresponding to that which is effected upon the sap in the leaf.

EQUIVOCATION OF THE CHURCH.—In 1816 James I. issued his orders to the heads of houses in Cambridge University, that all who took any degree should subscribe to the three articles mentioned in the six-and-thirtieth canon. This was acted upon till the year 1772, when the senate having previously appointed commissioners (or syndics) to inquire into the legality of the step, enacted, that candidates for the degree of B. A. instead of the usual subscription to the three articles, should, for the future, subscribe to the following sentence: "I, A. B., do declare, that I am *bona fide* a member of the Church of England, as by law established." This relaxation was still farther extended to Bachelors of civil law, of medicine, and of music, and to doctors of music. But what is the difference between a *bona fide* member of the church of England, as by law established, and one who subscribes to the articles of the church? Surely this was intended as a loop-hole for hypocrisy. The pure churchman would not hesitate to subscribe the articles, the pure dissenter would disdain to subscribe the *bona fide* evasion. The despicable hypocrite only would demand such a mask, and priestcraft alone would condescend to sanction it. One thing, however, may be gathered from the fact, viz., that nobody can tell what the church, by law established, means, except it be that portion of it, which relates to temporal possessions, upon which there is considerable unanimity among the sleeved and gowned.

NATURE AND HER TWO CHILDREN.—The mineral, vegetable, and animal world may be compared in their relationship to the letter Y. Both vegetable and animal spring from the mineral, but the animal is a moving twin, and feeds upon its brother vegetable. In this respect, they both resemble the two jaws; one of which is fixed, and the other is moveable. The highest order of vegetables and animals are farthest removed from each other. The point of union is at the bottom of the scale, where it is scarcely possible to distinguish between an animal and a vegetable. Nature, therefore has two distinct families, both proceeding from the same matrix, and, according to geological discovery, their creation was contemporaneous, and the progression in both has been from the lowest to the highest.

TO CORRESPONDENTS.

A Universalist.—*The passage in p. 122, of vol. 1, which traces all men's thoughts and actions to God, as the prime source, is not affirmed to be the language of Scripture, but only in harmony with it. We suppose it is not necessary to prove that man's righteousness is from God only; and it is equally scriptural and philosophical to assert, that God hath power, like a potter, over the clay, to make vessels of honour and vessels of dishonour—to harden and soften the heart as he willeth. Who else has power? "Not even a sparrow falls to the ground" without the power of God, for all power cometh from God, in whom we live, move, and have our being. The paragraph headed "Impartiality of Nature," in p. 24, is a collection of texts from Eccles. ix. 11, 12, and vii. 15—16. The passage quoted 1 Kings, 22, 33, instead of 1 Kings, 22, 23, is merely a typographical error, not easily detected. We are obliged to our Correspondent for pointing it out; we were not aware of the blunder. Our Correspondent also complains of our severity to Mr. Harris, in vol. 2. We did not know, until the termination of the volume, that he had given the £100 to the poor; when we heard it, we resolved to make reparation. Still, notwithstanding this new colouring matter, the whole affair is absurd. Why should a money-bait be held out to write against money, and why should the writers nibble at the bait? The giving it away does not alter the case. Money given in charity, and advertised in flattering terms in the newspapers, is money spent*

upon oneself. A man cannot eat money; he must spend it on something, and the greater portion of rich men's wealth is spent on the gratification of vanity. We mean no offence to Mr. Harris personally. We spoke of him more as the representative of a class, than as an individual. We never persecute individual character, and never will do it, not even in retaliation. We will rather suffer wrong. But certainly we do abhor the religious principles of such a work as that we quoted from. It is most uncharitable, and really impious. It lays the blame where it ought not to lie, and acquits the guilty. Why blame Liberalism, Radicalism, and Infidelity, for the evils of society? These are merely the natural reaction against the corruption of a false faith, and a selfish money and benefice-mongering priesthood, conspiring with an equally-corrupt class of lay brethren, to smother the religion of the Son of God. They are the Great Dragon, that spueth out floods of water against the Man-child, who is obliged to fly into the wilderness for a season from their fury.

The following is the Transcendentalist's reply to Universalist: With respect to the Universalist's P. S., the Transcendentalist begs to assure him that he can attach no meaning to the words "bounded only by space," though he is aware that this property is often predicated of worlds. Let the body bounded be of what shape you please. Why is it of this or that shape? Because it is bounded in this or that manner. If U. reflects on the meaning of the word "space," he will find that it is merely the form in which outward things appear, and that it is by no means a thing in itself, or even an appearance. If we look at the sky, and call it a large space, we mean that we see an extended blue surface. If at night we say we see the stars floating in space; we mean we see little night spheres bounded all round by a dusky coloured surface. Let U. only try to imagine a circle, without at the same time picturing to himself the surrounding surface, and that of a different colour. U. supposes a body as existing in space, and the space it immediately occupies as being all the space existing. This body, therefore, occupies all space,—supposing it to be spherical, what lies without the sphere? Body? No; for that would occupy further space. Space? No; by the hypothesis. And then, why is it a sphere more than a cube, if it be not bounded at all? And admitting that space is external to the body, what is mere space? is it of any colour, has it any properties whatever, unless the mere absence of body be called a property? How then shall we distinguish it from nothing? And if a body be bounded by nothing, how can there be different forms, &c. T. will write on this subject more at large in his next dialogue, and hopes to hear again from the Universalist, who is evidently far above a mere common place reasoner.

The Commercial Traveller in our next.

We have received complaints from several places, that The Shepherd cannot be got, the former agents declaring that it has ceased, &c. We do not pretend to divine their motives, but we wish to apprise the complaining parties that they are imposed upon, and advise them to credit no report of the kind which is not communicated typographically by "The Shepherd" itself. Any bookseller, in regular correspondence with London, will serve them, by merely giving him the publisher's name.

A Theocratist came too late, but he will find an answer to his letter in the leading article.

We are aware of Heraud's Legion in the "Judgment of the Flood," and may probably review it on a future occasion, when we have compared it with the book of Enoch.

LONDON: Printed and Published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

Sold by Watts, 14, Snow-hill, Birmingham, and Heywood, Oldham-street, Manchester; Baker, St. Nicholas-street, Worcester; France, 87, Side, Newcastle-upon-Tyne; Smith, Tradesman's Mart, Nottingham; Tinker, Huddersfield; Chappell, Southey's-buildings, Bristol; Riches, St. George's Bridge-street, Norwich; Pring, 7, Turner's-buildings, Exeter; Marmont, Nelson-street, Stroudwater; Cousins, Half-moon-court, Tiverton; Bird, Cox-lane, Ipswich; Blackshaw, Edward-street, Stockport.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Pantheism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*
"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 9, Vol. III.]

SATURDAY, AUGUST 26, 1837.

[PRICE 1½d.]

MESSIAH'S KINGDOM.

Behold, a king shall reign in righteousness, and princes shall rule in judgment.—*Isaiah.*

Jam redit et Virgo, redeunt Saturnia Regna,
Jam nova progenies cœlo demittitur alto.—*Virgil.*

The base, degenerate, iron offspring ends:

A golden progeny from Heaven descends.

—*Dryden's Virgil.*

Of all the magnificent ideas which have ever captivated the human imagination, none has ever equalled, far less excelled, the idea of the Messiah's personal reign upon earth. It is the splendour of the conception that has created the fanaticism respecting it. Men do not become fanatics for a trifling object. A fanatic soars too high up, above the common-place realities of life, to be excited into devotional frenzy upon a mere political question. It is by lowering the ambition of men that you cool their devotion.

The Radical has made a curious parachutical descent from the balloon of religion. His heaven upon earth is, annual parliaments, vote by ballot, and universal suffrage. The Millenarian anticipates no less than the descent of the immortal body of Jesus Christ, with all his saints, to take possession of a regenerated earth, bind the devil, and cast him into hell, and then live and reign on earth for a thousand years, unmolested by sin or death, or any kind of misery, until Satan be again let loose, like an incorrigible rogue, to pursue his old game of political and social mischief.

We like the Millenarian idea for its grandeur. It is sublime without being ridiculous; and we are not at all surprised that it has been the means of overturning many a sober mind, which meditated too boldly upon its imposing mysteries. But this bewildering effect was principally occasioned by the impractical view which was taken of the subject. The Millenarians are mere waiters. They do nothing. They merely tell each other, and tell the rest of the world, if they will listen to them, that Christ *will* come again; and they *try* to calculate the time, and they make all sorts of fanciful conjectures; and still, after all, they do nothing. It is a dreamy doctrine, and very well calculated for creating spiritual intoxication. We know what it is from experience. We have been of the party, heated up to the highest fever heat on the brilliant idea of the second advent. It was this very idea that first drew us out of the Established Church, and launched us into a sea of interesting inquiry, which has ultimately landed us in the haven of Universalism.

Nor was it from want of faith in the fulfilment of this promise of a Messiah, that we ceased to identify ourselves with the Millenarians. We still are Millenarians. We still look for the coming of the Messiah. The change which has taken place in our mind has merely been an opening of the original idea. When we belonged to the Church political, we entertained the common undefined ideas of a Millennium, which are peculiar to the Christian world,—such ideas as are to be found delineated, in forcible and luxuriant language, in the popular and successful poem of "The Course of Time," by Pollok, with whom we were intimate during the time of its composi-

tion, and to whom we suggested several ideas now embodied in the work.* The idea opened upon us by the discussion of the Millenarian question, by Irving, in the year 1828. We began then to see it politically. We saw the necessity of Christianizing the state; and seeing that the prophetic announcements of the Messiah spoke decidedly of the personal reign of a divine deliverer, we naturally enough gave our assent to the doctrine of the second advent, because at that time we had no idea of any other individual than Jesus of Nazareth representing the Son of God, or God on Earth. In a very few months, however, i. e. before the close of the year 1828, we overcame this difficulty, or rather this absurdity, by the discovery that the true Messiah was a divine principle, or in other words, the spirit of God manifested in the adoption of a beneficent ruling principle by human society; and that, whenever the fundamental character of Christianity, namely, social love and equality, was received, as the basis of political government, then it might be positively asserted that Christ was come, and that the Messiah had begun to reign.

In these three stages of religious opinion, therefore, we had the same original idea as a polar star to direct us. Apparently different, we are still the same—still looking for a Messiah, still expecting a Millennium; but neither looking for Christ to descend from heaven in a cloud, nor man nor earth to undergo any other species of regeneration than that which takes place through the exercise of the moral and intellectual faculties, the exercise of which alone entitles man, by pre-eminence, to the designation of the Son of God and the Lord of Creation. We know that there are many worthy men, of strong faith in the Messiah's coming, and whose zeal for the amelioration of the people's condition is equal, if not superior, to that of the most boasted liberalism, who will stoutly oppose this view of the subject, and tell us that it is giving the lie to the Scriptures, which distinctly specify Jesus Christ as the man who is to return and rule over the earth in its regenerated state. We do not wish to spurn away such believers, because we know from our own experience that they may be on the way to more expanded views of the Providence of God, but still, like all other opinionists, whether spiritual or material, they are hard to deal with. The Scriptures do speak of "this same Jesus, so coming in like manner as he went into heaven." Those who rest upon the *letter* of the Bible, consider this conclusive. We have not much faith in the *letter*, and we know not by what authority we can have faith in it. This same Jesus said of the bread which he brake to his disciples, "This is my body." The Roman Catholics insist that this is to be literally understood—and certainly nothing can be plainer than these four words; yet a figure of speech is evidently meant. Had the letter of

* We remember especially suggesting to the poet the idea of painting in heaven. He was highly pleased with the thought; but his fine poetic taste could not tolerate the idea of an angel's using a painter's brush, or *hog's-hair* pencil. He therefore makes the angels use their fingers only:—

"And dip their hands in colour's native well,
And on the everlasting canvas dash
Figures of glory, imagery divine."

prophecy ever been fulfilled, or generally been fulfilled, there might be some plausibility in the Millennialian argument; but it is notorious, that while the spirit of prophecy has received very ample confirmations and most marvellous fulfilments, the strict letter of great or universal predictions never has been fulfilled on any occasion. Hence we have no right to trust to it; nay, we are bound in common prudence to reject it as an ignis fatuus, which has proved delusive to all who have preceded us.

The general spirit of prophecy, we say, has never yet failed, or, if apparent failures may be pointed out, the fulfilments are so obvious, and so emphatic, as to over-rule any objection which may be made against them. The details of Christ's coming were not distinctly foretold; but a *special coming* was foretold, and distinctly expected. The same may be said of all that has taken place since. The general character of the Christian apostasy was foretold in a very striking manner; but the personalities with which it has been intermixed, have all proved a stumbling-block, both to Christians and Infidels. It is these personalities which delude the simple. Men are all idolatrous, whether they be Infidels or Christians, Papists or Protestants. They all hanker after favourite persons of their special worship. Hence, it is very difficult to persuade a Christian that the spirit of Christ can come in any other person than he came of old. Yet nothing is more in accordance with an enlightened view of the history of prophecy and the Church. The idea of Christ is too small, it is confined to a person. This is idolatry. And for this idolatry the Church is punished, and by this idolatry the Church is corrupted.

Were we to trust to a prophecy in this personal sense, we would trust to a delusion. Our idea of the Millennium is even still more sublime than that of the Millennialians themselves. We make every man Christ, who is imbued with Christ's standard principles. The whole mass of men thus united, is the great Christ, and the chosen individual who presides over them is the personal Christ. An association composed in this manner is Christ's kingdom upon earth. The hope of this kingdom is not connected in our mind with any magnificent theatrical display of trumpets, and processions in the clouds, or the personal descent from heaven of the great minister of the circumcision. We neither expect fire from heaven to consume certain obnoxious sects and parties, nor to regenerate the soil of the earth without the industry and the skill of man. Experience has taught us a little wisdom, and judging from the mistakes of our ancestors upon these important subjects, and comparing the vulgar expectations with the facts themselves, we have arrived to the very orthodox conclusion, that the kingdom of heaven is within us—that the clouds of heaven are the darkness that obscures the mind on religious subjects—and that the descent of Christ in these clouds of thought, is only the opening of the unblown idea of the Messiah, which had formerly been confined to the person of an individual, but now expands to the fulness of the godhead, and fills every human being that apprehends it. In this sense we feel that Christ is already *coming*. The descent has commenced. The vulgar Millennialian doctrine is the natural harbinger of it. This doctrine is wholly outward in its character. It chiefly directs the mind to the demonstration of the senses, and this very circumstance becomes the means of blinding it to truths of a higher order. This speedily dies of disappointment. It is the Baptist which *deceases*, whilst the more rational expectation of the spiritual and personal Messiah combined, is gradually on the increase.

We believe the Irvingites still continue to hope in the personal appearance of Jesus of Nazareth. It is very difficult, however, to ascertain their opinions on this or any other subject. They publish nothing by the press. The spirit has interdicted the use of the press for a season. Their doctrine is, therefore, wholly circulated by tradition. Any information which we can obtain respecting the creed of this universal church, as it styles itself, rests entirely on the testimony of private individuals. We have attended their meetings several times, but we heard only exhortation and admonition. This was rather irksome to one who does not consider any of the clergy, or any public instructor in the country, as in a suitable frame of mind for giving admonition and exhortation to the people. In our private conversation with the members or preachers, we are generally

annoyed with the same everlasting, unfinished, and useless ex postulation and dictation. If we put a direct question, we receive an indirect answer; and are told, at the same time, that our minds are not in a proper state for receiving the *answer direct*. We believe they do succeed in frightening many timid people into the faith by these means; but the *fearless*, who are not to be led by nervous apprehensions, retire in general as ignorant of the faith of their spiritual tormentors as when the interview began. We have been told, however, that Christ is expected in person, and that they are preparing a people to receive him. The church of the Irvingites is certainly a singular institution in these modern times. There can be no doubt that it has what is generally called revelation or inspiration to direct it; and there is no manner of doubt in our minds, that this spirit of revelation will deceive them, as it has deceived in all ages those who trusted to its literal meaning. The flesh and the letter are its leading principles.

There are several other parties in the country who entertain similar opinions. All the Southcottians, who, though scattered, are numerous, live in the same joyous expectations; and still continue to rise and walk after innumerable falls and disappointments. But all these parties are from the very spirit of their doctrine inactive. They religiously obey that mysterious and insulated text of Scripture so very convenient for the indolent mind; "Stand still and see the salvation of God." God is to do it all for them, and they have only to preach and pray for his coming. One would suppose from these worthies, that man was essentially a preaching and praying animal—that the highest rank of excellence, and the highest state of activity to which man as a regenerated being could reach, was exhortation and prayer. Our own opinion is, that it is the very lowest; that a man is in hell as long as he feels the spirit of prayer (else why does he pray? were he in heaven, he would not think of prayer), and that it is preposterous to extort or expostulate with human beings in a state of society which necessarily incites them to evil, so much so, that those who imagine they are being reclaimed from sins, are most frequently falling into sins of a more deceitful and dangerous nature. Do the exhorters and expostulators keep the laws of Christ themselves, that they take it upon them to reprove, and dictate to, their fellow creatures, living, like themselves, in the midst of temptation? Because they refrain from drunkenness and swearing, and from travelling or reading a newspaper on a Sunday, are they therefore holy men?

Have they left all and followed Christ? or what have they done, or what do they propose to do, which is calculated to promote the well being of their brethren? If all this activity is to be left to God or Christ when he comes, why not leave the preaching and praying to Christ also; and if anything at all is to be done by man, why not all or a part of all? Why not associate upon a Christian model, why not teach the Christian doctrine of association? What right has a clergyman to talk so long and so devoutly about points of faith, Sabbath breaking, drunkenness, and other heterodoxies, and forget the main cause of all these evils, the fundamental constitution of society upon the Satanic principle of selfish appropriation and money making? The kingdom of the Messiah begins by the destruction of Satan's kingdom. What is Satan's kingdom? Does it consist merely of gin-drinking and Sunday travelling, Sunday whistling and dancing, or the neglect of the ordinances of reading prayers three hundred years old, and singing psalms composed three thousand years ago, by a man whose feelings were not calculated to arouse the sympathies of an age like this? We should like the Church to give a definite answer to this question. "What is the kingdom of Satan, or of what does the kingdom of Satan consist?" We believe they do not know; and it is because they do not know what Satan is, that they cannot overcome the evil. Our own opinion is, that Satan may very easily be overcome, and that men will most effectually accomplish this feat, accounted so difficult, and by many impossible. The Scripture promise is, that we shall tread Satan under our feet, that is, we shall put him in subjection. Satan, in our opinion, is the selfish principle in society—the appropriation, monopolizing, and grasping principles in morals, and the *fearful* principle in religious faith, which makes men regard God as a fiend, and tremble to offend him, by thinking this, or saying that, or

holding opinions which are denounced by fearful fanatics like themselves. Selfishness and fear are the pillars of Satans kingdom. It requires only a Samson to take hold of both, and bring down the whole superstructure of iniquity.

Against this selfishness and fear we preach, and in so doing we believe we are more directly aiming at the vitals of evil, than any one of our contemporaries, either in the press or the pulpit. We teach simple and pure Christianity, undefiled by priestcraft, and for ever to be divorced from trade and commerce with human souls. We do not know of another publication in the country, in which Christianity is taught. The kingdom of Satan is supported by the whole craft of the hierarchy, and all the lay world of property is in concert with the ministers of Satan's theology, to defend the mystery of ungodliness. A large party has even the presumption to call itself CONSERVATIVE in Satan's kingdom! and this party is the special favourite and protégée of the Church! They evidently do not wish for the coming of Christ or his kingdom. The Lord's prayer is a mummery to them,* or used only as a blinder to keep up the delusion of the people, and prevent them from actively uniting to bring to pass the kingdom of the Messiah, which is really after all, nothing more than "THE GATHERING OF THE PEOPLE."

* "Thy kingdom come," &c.

SOCIAL CONDITION OF NORWAY.

ALMOST all the privileges for which the Radicals of England are now clamouring, have been already obtained by the inhabitants of Norway, who, according to Mr. Laing's journal, published last year, are evidently the happiest people in Europe, perhaps in the world. Indeed, he represents that republic as having advanced to a state of social comfort, which America, France, and England, may only expect to attain to about a thousand years hence. They have obtained universal suffrage, and the abolition of the hereditary peerage; they have a free and unfettered press, and the privilege of having their newspapers conveyed post-free: so that a daily newspaper costs only 28s. per annum. They have no entail, or primogeniture laws; and the property is so equally divided, that the greater proportion of the inhabitants are proprietors, or life-renters in comfortable circumstances, so much so, that every cottager has a house of several apartments, with many domestic comforts; and what is, perhaps, still more singular, in a Protestant country, they have a national church without dissenters! The people are satisfied with their clergy, and the clergy are evidently much more attentive to the instruction of their flock, than our spiritually proud divines of England and Scotland; for an Episcopal confirmation is an examination of such a searching character, that none are allowed to pass without giving most satisfactory proofs, not of being able to repeat a Church catechism for children, but of understanding thoroughly, in the usual orthodox style of understanding, all the leading principles of religion and morals. This confirmation is so highly valued, as a test of character and attainments, that it is usual in the newspapers to advertise for a confirmed shop-boy, housemaid, clerk, or any other species of servant. So says Mr. Laing. There is, no doubt, a good deal of mockery in this confirmation after all, and the circumstance of there being no dissenters, is a satisfactory proof that the controversial faculties of the people are not cultivated; and, therefore, in a theological, or metaphysical sense, they must be of an inferior order, and naturally prone to superstition and credulity. This is really the case; but still the fact of national unanimity, and so close an approximation to social equality is pleasing to contemplate, and forms a luminous contrast to the picture of misery which presents itself in the highly intellectualized countries of science and civilization. "He that increaseth knowledge," says Solomon, "increaseth sorrow." There is much truth in the remark, when applied merely to science, for science and wisdom are two different acquisitions, and we are making much more progress in the former than the latter.

The following is Mr. Laing's account of the people and press in Norway:—

"The liberty of the press is one of the articles of the ground law. It is free for every man to print and publish what he pleases; there, cannot, consequently, be any censorship, or any suppression of publication—but every man is responsible for what he chooses to publish. For treason or blasphemy he is amenable to public justice; but the ground law defines, that to constitute the offence, it must be open and intentional. Defamation, or libel, also, on private character, must be open, intentional, and false, to constitute the offence.

"The state of the periodical press in a country gives a true measure of the social condition of the people, of their intelligence, their openness for constitutional privileges, and even of their domestic comforts. The newspapers, since I came here, have been my principal and most instructive reading. In Norway there are upwards of twenty; but some only give the advertisements and official notices of the province or town in which they appear—even these are not without interest to a stranger. It is curious to see what is to be sold or bought, and all the various transactions announced in an advertising newspaper. Of those which give also the foreign and domestic news, the most extensive circulation appears engaged by a daily paper, called the *Morgen Blad*, published in Christiania. The cost of a daily paper, sent by post, is seven dollars, or twenty-eight shillings sterling, yearly. There is no duty on newspapers; and as there are six or seven published in Christiania alone, this price is probably as low as competition can make it. In paper and type this journal is superior to any French or German one that I have seen, and its articles of foreign news, and its editorial paragraphs, are often written with great ability. From the importance attached, in all these newspapers, to little local affairs, it is evident that the mass of the people, not merely an educated few, are the consumers. There being no tax on advertisements, the most trifling matter is announced, and a publisher appears to have a kind of brokerage trade at his counting house, and to be empowered to sell or buy for parties, or at least to bring buyers and sellers together. I have seen it advertised, with a reference to the Editor's counting house, that there was a turkey-cock to be sold, a cow in calf wanted, and such trifles as show that the class, to whom they are no trifle, read and have the benefit of newspapers.

"The most entire freedom of discussion exists. Public men and measures are handled freely, but I cannot say injuriously or indecorously. The Norwegian newspapers, and especially their numerous correspondents, are much occupied with objects of local interest, and keep a watchful eye over the conduct of men in office, from the lensman of a parish, to a minister of State. No neglect or abuse passes unseen or unnoticed, and if the accusation, even of an anonymous correspondent, appears well founded, the highest functionary feels himself morally obliged to bend to public opinion, and explain the transaction. If he is unjustly, or unreasonably blamed, he finds pens drawn in his defence, without trouble to himself. The public functionaries have been made to feel that they are the servants, not the masters of the public. Under the absolute government of Denmark, although authority was mildly and judiciously exercised, the functionary naturally felt himself the delegate of the master. The interest or accommodation of the public was a secondary consideration. The old officers bred in this school *cannot understand* the influence of public opinion, and feel rather awkward in being summoned before this tribunal, perhaps by an anonymous writer, to answer for real and obvious errors in their official conduct. The temperate, but firm manner in which these controversies are carried on, the absence of any outrage on the private feelings of public men, even when their public conduct is attacked or exposed, do honour to the good taste and good sense of the nation, and prove that a press, as free as that of the United States, may exist without scurrility, or brutal violation of the sanctity of private life. Such newspapers as the American people read, would not find editors or readers in this country.

In Sweden the press is under a very strict censorship. It is somewhat amusing to see published in the Norwegian newspapers, the articles for which, in the sister kingdom, the publisher has been prosecuted, his newspaper suppressed, his business, and the bread of many depending on it, interrupted as if

the peace of empires had been violated. Yet here the same articles are, as matters of course, given at large, commented on, circulated, read, and forgotten, without producing the slightest ill consequence. Prosecutions, at the instance of government, have been attempted, as in other countries, against the editors of newspapers; but the ground law is distinct as to what constitutes an actionable offence against Church, State, or individuals, in printed and published matters, and a peculiar principle in the jurisprudence of this country, which I shall endeavour to explain at another time, makes the judge responsible for, and obliged to defend, *as a party, the correctness of his legal decision*, before the Supreme Court, and that court a constituent part of the State, independent both of the executive and legislative, rendering it impossible, which it is not perhaps in Great Britain, that judges, in their decisions upon political offences, should be swayed by political feelings and party spirit. Such prosecutions have, accordingly, in every instance, been determined in this country on the most impartial principles, without any leaning, either towards government, or towards popular feeling.

"Besides newspapers, there are a considerable number of periodical and occasional works published. There is a Penny Magazine in great circulation. The matter, and even the plates, I believe, taken or borrowed from its English namesake. And there is another weekly magazine, upon the same cheap plan. There are several monthly journals, on literary, antiquarian, agricultural, and military subjects, and in almost every newspaper there is the announcement of some new work or translation."

PROTESTANT DELUSION.

THE following awful specimen of Protestant Christianity we have copied from the last number of the *Evangelical Magazine*—

Extract of a letter from the Rev. W. Cooper, sen., Dublin, to a friend, a very influential person in New York.

"You are, I am persuaded, better acquainted with the political affairs of this country than I am; and concerning its religious affairs I am almost afraid to write. Popery is increasing by its splendid churches (as they now call their chapels), and other religious houses, and by the number of its now well dressed, nay, *fashionably* dressed priests, monks, friars, &c. &c. They swarm like locusts in our streets, (see Rev. ix. 1—11.) and infidelity stalks abroad. Yet 'the glorious gospel of the blessed God' is evidently, and even rapidly, gaining ground. Popery is spreading over the land; but 'the streams which gladden the city of our God,' (Ps. xlv. 4, *study the whole psalm*) are running, and swelling, and spreading, and fertilizing underneath; and (you know the amazing power of vegetation) as the grass grows, its spring will burst, and the ever-green (not Popish) of Ireland shall adorn its every rood. 'Then shall the earth yield its increase, and God, even our God, shall bless us,' &c. (Ps. lxxvii. 6, 7, *study the whole*).

"Ah! my infatuated brother, John Bull, strong to make money and to fight, is yet very *gullable*; and, therefore, no wonder that Jesuitical practices have deceived him, and led him to suppose that Popery is not the same as in ages past! 'Can the leopard change his spots?' The tiger is very docile to his keeper, in our mild climate, and in his den; but loose him into his own wilds, in his own country, and you will soon perceive that no reformation has been wrought. Satan can appear, when it suits his purposes, 'as an angel of light'—so can Popery; but, like the devil, it is '*always the same*.' (This, you know, is the English of its Latin motto).

"Popery has not the germ of reformation in it. Other religious communities, however they may have gone astray as lost sheep, yet, if they 'forget not God's commandments'—if they hold that principle, namely, THE ALL-SUFFICIENCY OF GOD'S WRITTEN WORD FOR FAITH AND PRACTICE, they may reform, and I believe they will. (See Ps. cxix. 176). But Rome has not that principle. Rome has rejected and persecuted it, and still rejects and persecutes; and, therefore, Rome cannot be reformed. The fiat of God's decree has gone forth against her,

She shall not be reformed, but destroyed. The Almighty angel of the covenant shall lift this mill-stone from the earth, which it has oppressed so long, and ground to pieces thousands of its best inhabitants, and 'cast it into the sea, where it shall sink to rise 'no more.' (Rev. xviii. 21). And, in the inscrutable ways of God's providential dealings, perhaps the present elevation of that devoted mill-stone is but the immediate precursor of its final fall, and only intended to make its plunge into the sea more signal and more dire."

"W. C."

This is a ludicrous specimen of the self-conceit of a Church, which actually boasts of rejecting the living spirit of Christ, by appealing to the *letter of the written word* as the supreme authority; and with this indecisive judge, whose meaning is dependent upon a living interpreter, condemning another Church, which appeals to the living spirit of Christ in the Church. We do not know which of the two contending parties are most to be marvelled at—the Catholic, for its impudence in calling that a universal Church, which is merely a close corporation of cardinals; or the Protestant, for its presumption in calling that a Church which has not the living spirit of Christ as a supreme court of appeal, and for want of this living spirit, represented in a visible form, obliged to resort to a written book, about which no two Protestants can be found to agree. If the Catholic Church be the tower of Babel, Protestantism is merely the loose brickwork which has fallen from the summit. Its countless heaps of churches, chapels, and conventicles, present a hideous picture of a temple of the Holy Ghost, the church of the Saviour of *lost sinners*! It certainly is the Church of *lost sinners*. But where is the Saviour? Gone to heaven, says the Protestant—in the Church, says the Catholic. Which of the two is most in accordance with the written word, after all? "Behold, I am with you always, even to the end of the world." Verily, we believe both Protestants and Catholics are in sad delusion, but Catholicism is the Church in a corrupt state. Protestantism is not a Church at all; it is merely a heap of fallen rubbish and loose brickwork. The true Church is the general assembly of Christians, organized upon the principle of universal suffrage, and social love. The Head of the Church is, then, the TRUE and INFALLIBLE representative of Christ and the people at one and the same time. This is Universalism. Every man may understand it. A Church so constituted is superior to the Bible.

THE TRANSCENDENTALIST'S DIALOGUES.*

No. VIII.

ON "THE ONE."—(Continued from p. 60.)

Transcendentalist.—Materialist.

Trans.—Before we proceed to the consideration of a *finite* universe, as is proposed in our last dialogue, there is a subject I wish to consider, and as it really bears on the point, it will not be misplaced. I have received a communication in which a gentleman expresses himself not altogether convinced of my theory, that the existence of a finite body *necessarily* involves that of another, which is its boundary.

Mat.—Indeed!

Trans.—Yes, and he says that he can conceive an atom, or a finite body, bounded merely by empty space.

Mat.—Why, so do the astronomers treat of planets &c. They say there are worlds floating in space. Your correspondent's view seems perfectly correct.

Trans.—We will examine it. You grant, of course, that the planets, &c., are spheres, spheroids, or something of the kind?

Mat.—I do.

Trans.—And, indeed, that every finite body has some figure or other?

Mat.—I do.

Trans.—Well, then, we will consider the body as a sphere, though of course, our arguments will extend to every other sort of solid figure. Now, I will tell you another observation of my correspondent's. He says that even if the space which the

* The Universalist will oblige me by reading this dialogue.—T.

body immediately occupied were all the space there was, still that space would be sufficient for the existence of the body.

Mat.—And so it would!

Trans.—Let us first enquire whether the hypothesis itself be possible. Granted that there is no other space but that immediately occupied by the special body, would the space itself be spherical?

Mat.—Yes.

Trans.—Good, not only the body, but the space it occupied, namely, the whole region of space would be spherical. Now, what lies without this sphere of space. Is there any space beyond it?

Mat.—No!

Trans.—What, then? Is there any space beyond it?

Mat.—No, for then the body would occupy space, and by our hypothesis the spherical space is all space.

Trans.—Then, if there is nothing beyond it, not even empty space (assuming for a moment empty space to be more than nothing), how can it be said to be bounded at all? And if not bounded at all, how can it be of any figure?

Mat.—I see, I see. It will not do to admit the existence of a portion of empty space of any definite form. But still that is no argument against a body being surrounded by empty space.

Trans.—That I grant. But I pray you tell me what this empty space is? Have you ever seen any?

Mat.—No, no, certainly; but I can imagine it.

Trans.—Well, here is a black ball, now imagine it floating in empty space.

Mat.—I do.

Trans.—And now tell me the picture that your imagination formed.

Mat.—I fancied I saw the ball swimming through the sky.

Trans.—And the sky was blue?

Mat.—Yes.

Trans.—And is empty space blue also?

Mat.—No. Empty space can have no colour.

Trans.—Then it appears, you have not imagined a ball floating in empty space at all.

Mat.—Perhaps not imagined, if you mean formed a picture. But still that does not prove that I cannot form a conception of it. Now, I have a perfect conception of such powers as magnetism, gravitation &c., and yet I cannot imagine, or form a picture of "magnetism."

Trans.—No. But you have seen needles drawn by a load-stone, you find by experience that certain stones can draw iron, and then to this power that you see manifested you give the name of "magnetism." When you say "this stone is magnetic," you mean no more than that if brought within a certain distance of particles of iron, it would attract them.

Mat.—True, I cannot picture to myself the power, but only its manifestation. I see certain phenomena and conclude on a power; may not I, equally well, from certain appearances which I can perceive, conclude in the existence of empty space which I cannot perceive?

Trans.—Yes; but before we talk of its existence, I want to know what is this mysterious something the existence of which you desire to prove.

Mat.—Why, it is the reverse of body; body stands in space, and the interstices between bodies, are occupied by space.

Trans.—I ask *what* it is; not *where* it is, nor what stands in it. Is it something or nothing?

Mat.—That is a difficult question. Empty space can scarcely be called nothing; and yet it is that which remains after every thing is taken away.

Trans.—Come, come, I am sure that these shades of "nothing" are too subtle for the apprehension of either of our brains. After deducting every thing, what *can* remain but nothing?

Mat.—Well, well, empty space is nothing, but yet it has its uses.

Trans.—Very good. Then, when we talk of two planets with empty space between them, we say there is nothing between them; and when we say there is nothing between two things, we generally mean they are in contact.

Mat.—Now, that is a mere pun. I can easily perceive two

bodies with nothing but space between them, and yet being distant from each other. Stay, stay, I find I was very wrong in calling space absolutely "nothing," it possesses one property and that is extension.

Trans.—Still I am in the dark. I can understand what is meant by coloured extension, and so on; but extension by itself conveys to me no meaning whatever. Yonder sky is extended; that is, we see a surface of blue.

Mat.—But mathematicians often treat of extension alone. When they treat of a triangle; (for instance,) they consider it merely as a portion of extension; they neither regard colour nor material,—in fact, a triangle cannot be a body, it is a mere surface.

Trans.—And what does this prove? Merely, that if I draw a triangle on a piece of paper, that I can reason on those properties of the triangle, which are likewise possessed by a triangle drawn on a slate, &c. A connoisseur of colours, looking at a painted door, will direct your attention to the beauty of the piece, without once calling your attention to the size of the surface. But this does not prove that he ever saw, or even can conceive a colour which occupies no space at all. Thus it is with space; we see a body and regard its magnitude alone, which is all very well; one of the properties of body is extension, and we direct our thoughts to that particular property. But, then, what right have we to fancy that the extension would continue, even if all body were annihilated, when we admit, that by the greatest effort of imagination, we cannot picture to ourselves extension without colour, or some other quality? Extension merely expresses the *nebensinnderseyn* (German) of a body; that is, merely means, that the parts of a body lie one without the other. Hence, extension can never be the *sole* attribute of any thing; for how can one part lie without another, if there are no parts? How can the position of parts be the only attribute of anything? Our phenomenon is bounded by another phenomenon, or is a bound to ourselves; though, perhaps, the boundary manifested to one sense is not manifested to another. Suspend an orange from the middle of the ceiling by a thread. To the eye of a person standing against one wall of the room, the orange appears surrounded by the opposite wall; does he stand under it, the orange appears bounded by the ceiling. To his touch no such boundary is manifested; he can grasp the orange with his hand, and of course does not feel the wall, which is at some yards distance. But how is the orange revealed to his touch? Because it acts as a boundary to himself; he is not so free when he holds the orange, as while his hand is empty. In one case he can shut or open his hand as he pleases, in the other he cannot. We cannot conceive of one thing bounded otherwise than by another thing, we cannot arrive at it by argument. It was no pun, when I said I could not conceive of bodies separated by "nothing" otherwise than as in contact. If we say two bodies are in different places, we express their relation with regard to each other. "Place" (*i. e.* occupied space) itself is merely a relation of various bodies, or phenomena; there can be no relation between place itself and body.

And now for the finite universe. Empty space, as I have shown, can be no boundary for body; and hence, the universe, which includes all body, cannot be bounded in space. Hence the universe is not finite.

Mat.—The deuce, it is not! And, in our last dialogue, we came to the conclusion that it was not infinite. Is not that absurd?

Trans.—Of course it is. It is absurd to reason on the properties of the universe altogether. On that which is manifested to us we can argue, but how can we discourse on that which is never revealed. What is the universe? merely a word to express the fact, that whatever quantity of finite bodies we imagine, we must always imagine them bounded by something beyond—and so on—and so on. In the same way, take any number you please, however high, and you can always conceive one still higher. But this does not prove that you conceive the really highest number. Neither can you conceive the universe; if you assume it to be infinite, it is obvious that no synthesis will be sufficient to take it in; if you assume it to be finite, you find that you are always asking for something beyond,—in

other words, that you have not grasped the *whole* universe. When you talk of things which are impossible to be perceived or conceived, you are admitting the existence of a world altogether independent of a conscious being, which is, as I always labour to prove, an atheistical absurdity.

AN ARTICLE FROM AND FOR A SPIRITUALIST.

THE following article was sent some time ago by a gentleman, who really is what he styles himself, a Commercial Traveller. He is also an abstainer from animal food, and a water drinker. He is, moreover, a professed Spiritualist. We cannot insert the dialogue, however, without a comment. In the first place, the language is not suitable for the *Shepherd*. It is unintelligible, and equivocal; not calculated to incite enquiry, and far less calculated to stimulate activity. We must use common language in our publication. We are not strong enough to *palm* a language upon the public. The repugnance of mankind to learn new languages, even when their personal interest is evidently deeply interested in the acquisition, is very great; but when nothing but the eccentricity or whim of an unknown individual is the moving cause, pray what effect can follow but contempt, and refusal even to read?

We insert the dialogue, after having rejected a former communication still more unreadable, in the hope that our commercial friend, by merely looking at it in print, may feel satisfied, that whatever truth there may be in it, it is not a mode of instruction likely to kindle a flame of useful activity in the simple mind. *Mere spiritualism is selfishness.* All Spiritualists, who do not employ their vital principle of action in active co-operation with their fellow-men for bettering the outward modes of social intercourse, are monks only. They may preach to all eternity upon abstractions, without making any useful impression upon the minds of their hearers; and all the while, their enemy is ruling the people in the only way in which men can be ruled, namely, the modes of social and political action. Men can understand modes of action, but they cannot be bothered with abstractions. Our abstract gentlemen have this important truth to learn, and we put it in italics, that they may meditate upon it, that *their finely wrought principles of abstract being, are only useful when employed by themselves inwardly as guides to direct them how to proceed in urging forward the public mind to the adoption of some outward means for producing a vital change in the religious and political condition of human society.* The people will never go deep into any subject.—Why should they? It is not necessary. They may understand the solar system sufficiently well, without algebra, or conic sections—It is the business of astronomical leaders to understand all the principles of mathematical calculation, but the people only want to know the *arrangement of the system.* The attempt to teach the people any thing more than the *outward mode of arrangement* will defeat itself for ever.

A question of eating and drinking is too trifling in its character, and so purely individual or selfish, that as our Commercial Traveller informs us, every man should have the answer to it in his own bosom, head, or heart. This is the best part of the dialogue, and is our principal reason for admitting it. In other respects, he has evaded the question altogether, talked about any thing but the point of discussion, and left us just where we wish to be left, to ourselves and to God. But would we not have been better left, had nothing at all been said or written? He tells us that "no other man can answer a man's own interrogation." We are afraid our Traveller has travelled to little purpose, if he has acted upon this principle in his commercial dealings. We should not like to employ such a traveller. There is, however, a portion of truth in the proposition, but our Traveller does not seem to be able to analyze it. No man can answer my question, unless I am qualified to become a recipient of his answer—but if I can receive it, the answer becomes mine by appropriation. We are none of those ascetics who seek truth in solitude, "we light our own at other men's torches." Intellect is the organ of communication between man and man, and there are truths belonging to every

mind, which could not, by any possibility, have been there, without intellectual intercourse with other men. Ideas are generated upon a principle resembling the generation of animals—one animal cannot generate life, neither can one man generate ideas. Ideas are procreated by union, and every man is male and female as a generator of ideas; for he not only begets ideas in others, but conceives ideas in return. Our Traveller, therefore, when he tells us to receive nothing from without, or nothing on the negative side, talks unmeaning language. The negative side is the only recipient. The positive is the giver, the negative is the receiver. He may put another meaning on his language, and make it correct; but of what use is it, after all? It is merely *hair-splitting*; it wants *heart*. It is a play upon words—a word philosophy, a word theology, a selfish spirituality, which decries the social and intellectual principles, which are the only means which God has ordained for conveying any happiness that is worth enjoying. With these few observations, we insert the dialogue, hoping that if our friend live twenty years longer, nay, ten, and cast his eyes over it, he will say, "Aye, I was a monk then, but now I am a *social fellow*."

Intellectualist.—I am glad, Sir, to have the pleasure of meeting with you, having had, for some time, a great desire to hear, from your own lips, an account of your reasons for living upon a vegetable diet; and I also furthermore wish to hear from your own mouth, whether it be true, that you have dared to protest against the continuance of human marriages. I am persuaded, Sir, from what I have heard of you, that you will not consider it as impertinence in me to make this request, seeing that my motive is not mere curiosity, but a sincere desire to obtain instruction. Permit me, dear Sir, to add,—you cannot but be aware, that in thus daring to differ from a vast majority of your fellow-men (yea, even the Christian section of them,) you are singularising yourself as *one* to whom the Almighty must have extended a peculiar degree of illumination. Did not the prophets and holy men of old eat flesh, and that, too, by the express command of their God? Nay, but more than this, did not He, of whom it is written, "This is my beloved Son, in whom I am well pleased, hear ye him,"—I repeat it, did not the acknowledged Son of God, the great example for men, partake of animal food, and drink wine also? If you cannot deny this, it seems but needless to refer you to the example and practice of the most illustrious of the Fathers, those eminently pious men, who scrupled not to follow their Saviour's example; and again, to the continuation of this practice, as now exemplified in the conduct of our strictest pietists. Do not all follow on in the well-beaten track of flesh eating? Perhaps, Sir, it may be as well to waive the marriage question, until you have a little explained yourself concerning the abstinence from animal food, and fermented drinks.

Unionist.—Instead of considering your thus questioning me as impertinent, I am, with much delight, obliged to acknowledge that I esteem it as a favour, inasmuch as that thus an opportunity is afforded me to *outwardly* express *what* is my inward state of *being*. But, my good friend, although I so cheerfully comply with your request in submitting to give the best explanation I can of myself, I by no means engage that it shall be satisfactory to you, seeing that no other man can answer a man's *own* interrogations. When you ask a question, it is but the expression of a question *asked* in you, and when you answer a question, it is but the expression of an answer *answering* in you. No answer given to you from *without* by other being, will avail to satisfactorily answer the interrogation of your own being. The questioner and the answerer are ONE.

I.—I think I can partly understand what you mean by the questioner and the answerer being one, at least so far as it regards bodily sensations; but, indeed, I must confess that I am far from being able to go the whole length of your assertion, I do most assuredly perceive, that with regard to our sensations, we must individually be the answerers of our own questions; for instance, I ask you what is tooth-ache, knowing you to be, or to have *been*, the subject of it; you give me a minute

description of its effects, and I am just where I was in regard to a conscious knowledge of tooth-ache, I must be it to know it, with reference to my constitutional sensations I must be my own answerer. But, surely, this does not apply to all questions asked, I do not at all perceive its bearing upon the question I have just proposed, and I do not at all see why you should not be able to satisfactorily answer them. You, of course, must have some motive in thus depriving yourself of those indulgencies, (nay, even common necessities) so amply provided for us by our bountiful Creator. Do you suppose me to be void of common understanding, or are you about to speak to me in an unknown tongue? You will excuse me, Sir, but I am not without fear lest you should think somewhat too highly of yourself. Perhaps I am a little impatient—will you proceed, Sir.

U.—If I consent to be interrogated by you in your own manner, is it more than fair that I should be allowed to answer your interrogations in my own manner? This you admit. Very well. Supposing, then, that my mode of answering is an interrogatory one, you must, of course, be prepared to answer my questions in your own manner.

I.—Sir, you are, without exception, the oddest man I ever met with, however, I suppose there is no getting on with you unless one submits to oddness. I must consent to be a little foolish, just for once, but I can't promise that it will be for long, for I expect I shall never be able to endure your Quakerish mode of discussion; but, pray go on, and let us have your first question, if I must be questioned by way of eliciting an answer to my own question.

U.—To begin, I ask you a threefold question; *what* are you from, whence are you, and whither are you tending?

I.—Sir, nothing but the firm conviction I have of the sincerity of your motives, would induce me to continue this correspondence a moment longer; what in the world can the question just proposed, have to do with your explaining your reasons for abstaining from animal diet; just be so kind as to give me some little idea of the relationship of the two questions, if I can but perceive that remotely they have a bearing towards each other, I will endeavour to answer you.

U.—A man's outward conduct is always representative of his inward state of being, it is the very expression or likeness thereof; if you ask him why he does this or that particular thing, he must, if he speak his feelings, say my *inward* nature (or whatever term you please to give it) inclineth me to it, I am but following out a propensity, or bias in my nature.

I.—Excuse the interruption; but, Sir, permit me to ask, are there no outward motives for action? do we not sometimes follow outward attraction? do you mean to assert that all our actions are involuntary? are you going also to deny the freedom of the will? are we not free agents?

U.—The human will, considered as a secondary will, must depend on a primary will, which also depends on unity—the *all centre*. The freedom of the human will consists in its consenting to co-operate with its primary or universal will, in union with unity. The human will, considered only as a secondary will, is *will* in bondage, in limits; whatsoever, therefore, it does from itself as an end, cannot be an act of a free will, it is will acting in limitation. You ask, is not the will free? but why do you not ask, in *what* is the will free? Is the man *free*? what man? the man in *prison*? no. But the man in prison has a capacity for freedom? yes. But he loses his freedom the moment he ceases to co-operate with the laws of the law-giver, whatever country he may be in. A man is exteriorly free no longer than while he lives in harmony with the laws of his country; let him once break his connection with these, and those who before preserved him in freedom, now bind him hand and foot, and cast him into prison; he has set himself in *opposition* to them; they, therefore, are now become his opponents. The human will, in harmony with its universal, and most antecedent will, lives in freedom; but let it once be broken off from this connection, and it immediately becomes an imprisoned will, and however secure it may be in its chains, none of its acts are free-will acts, but only the acts of a prisoner!

I.—Ah! Now, Sir, I begin to perceive that you would have

me to understand that we are quite mistaken in supposing that the outward objects we perceive are the *inciting* cause of action, and that there is some difference between incitement and excitement. You would have me to understand, I suppose, Sir, that excitement is merely the drawing out into action already incited feeling.

U.—Yes, Sir, and that thus what is termed wicked conduct, is but the expression of a universal evil spirit, that holds a generating relationship with the nature, through whom, it, by primary impressions, or imregnations, ultimately expresses itself into outwardness of action.

I.—But, pray Sir, how do you dispose of man's accountability, or his responsibility? How can man ever be in fault, if all his actions are but the expression of an antecedent spirit in his nature.

U.—I am glad, Sir, that you are in some measure able to understand me; only be quiet, and, as much, as possible, lay aside all pre-conceived *notions* (for the best of these are of no value), and I make no doubt that you will very shortly begin to perceive the propriety of my mode of answering questions with regard to it.

I.—Again, pardon me for interrupting you, but I cannot forbear thanking you for the great pains you have taken in endeavouring to force me to *think* for myself; I was at first disposed to be a little angry at what I imagined as dogmatism in you, but I am now glad that you had the patience to bear with me, and that, instead of cutting me off with a few abstract *reasons* for your singular conduct, you have driven me as it were into the depth of my own being for the answer.

U.—Unless you are driven to a deeper depth than *your own* being you will not obtain the satisfactory answer, you must not consent to be put off with the either ultimate or mediate answer, these leave you unconnected with the *antecedent end*, which is indeed the asker of the questions, and therefore the only satisfactory answerer, when the *end* answers the *end itself* in you, then you will be a conscious satisfactory answerer. You can only *really* know *what* you *really* are in the spirit. If you *really* will know *more*, you must *really* be more in the spirit. And to *really* be more in spirit, you must, as to your degenerated and self-acquired being, become less: why did I not attempt to form an answer to your question that your understanding could have embraced, just that because I would by all means avoid making any addition to the immense quantity of excrescences or fictitious self-accumulated knowledge, which, as an incrustation or crust, covers you. Had I given you an answer from *without*, I should but have assisted to further encase or entomb you. But this is not my *office*, I cannot assist you on the negative side; but on the contrary, I must constantly call upon you to take nothing *in* on that side, whether it is called good or evil, I must incessantly remind you that your only activity must be, that of *not* satisfying a single want of your fictitious existence be it of what kind or sort it may; but above all, it must never cease to tell you that until *SELF* (or a *degenerating principle* in your will) is denied, not one step can be taken towards your regeneration.

I.—Sir, I must beg leave, at least for the present, to decline the conversation, for I am by no means equal for it, *what* you mean I cannot even imagine, and as to attaching a meaning to what you say myself, this I can't do; I am in a complete mist; you have raised a dense fog about me; I don't know that I shall ever be able to find my way *home* again.

U.—Your account of yourself is truly encouraging, and I can only hope that you may indeed never find that *home*, from which it is clear you have at any rate been a little removed. Be not afraid of the dense mist yet surrounding you; your piercing it is a sure sign that the *density* is decreasing, otherwise your perception could not increase.

I.—Well, Sir, I can but thank you for your patience with me, but really I had no idea that my asking you such a simple question would have led to all this: however, as I must confess that the discussion is not altogether uninteresting to me, perhaps you will have no objection to our resuming it, when we next meet. In the mean time, Sir, I wish that you would make an effort to render yourself more intelligible. Good bye, Sir.

SAVAGE THEOLOGY.

THE speculations of the Yellow Knife Indians, regarding the creation, are dwelt on at length in Franklin's journey to the Polar Sea, but most of them are either forgotten, or strangely distorted by the present generation, who content themselves with a simple belief in the existence of one great spirit, who rewards the good, and punishes the evil doer. I was once speaking to a Camarade de Mandeville, a Chippewyan chief, on this subject, and was endeavouring to impress on his mind a few moral precepts for his future guidance, to which he listened with the most profound gravity and attention. When I had concluded, he raised his head a little, and with eyes fixed on the floor, said, in a low and solemn tone, "The chief's words have sunk deep into my heart, and I shall often think of them when I am alone. It is true that I am ignorant, but I never lie down at night in my lodge, without whispering to the Great Spirit a prayer for forgiveness if I have done any thing wrong that day."

The following is a good lesson for Christians, we question if any of the missionaries could teach a better:—

"These people (Chippewyans) are by no means wanting in shrewdness, when occasion offers for the display of it. Mr. McLeod was reproving one of them for the bickerings he had had with the other tribe, and after expostulating with him on the danger of so bad an example, informed him that they were all brothers, created by the same power, which made no distinction between man and man, but regarded every one according to the quality of his actions; that they should be kind, therefore, and charitable towards each other, for that such conduct was pleasing to the Great Spirit. 'Ah!' said the Indian, with a heavy sigh, 'that is good, and if the chief wishes to teach us in that way, which is very good, let him show that he fears the Great Spirit, and give me a gun to hunt with, for my family are starving.'"—*Capt. Back's Journal.*

CHRISTIANITY IN INDIA.

"Of the three hundred native Christians (at Singapore) mentioned in the census, at least nine-tenths are Roman Catholics, who are either descendants of the Portuguese, or converts to the French Jesuits. There is a clergyman of the Church of England in the settlement, who performs divine service in a house which has been fitted up, and consecrated for a chapel. There are, also, two or three dissenting missionaries at Singapore, but they do not appear to have much success in the conversion of the natives, the effects of their labours being rarely heard of in the settlements, except through the medium of missionary publications, brought out from England(!)

"The labours of the Jesuits are confined to the Pagan natives in the settlement, for the Mahomedans hold their form of religion in great contempt, and are apt to designate it as *Christian idolatry*. The great success they have met with in Cochin China, and in other parts of Eastern Asia, is to be attributed to their entire devotion to the cause in which they are engaged, their attention being solely turned towards the propagation of their faith: pecuniary emolument cannot be their object, for the pittance allowed for their support is in itself insufficient to tempt them to embark in so difficult and dangerous a service. Whenever they have gained a considerable body of converts, they generally endeavour to acquire apostolical supremacy, with a view to convert the entire population by a *coup-de-main*. This was the case in Cochin China, during my stay in the Archipelago. The Jesuits, who had been tolerated by the Government, made great progress; but they induced their converts to rebel, and the consequence was, that two of them were beheaded, and the remainder were expelled the country. The system may be found to answer in countries like Paraguay and California, where the natives are divided into many petty tribes; but in powerful kingdoms, which possess a substantial government, the results must be very different.—*Earl's Voyages and Adventures in the Indian Archipelago. Lond. 1837, p. 392.*

DRUMMERS' FESTIVAL.—The patience and constancy of the Spartan youth most conspicuously appeared in a certain festival, celebrated in honour of Diana, surnamed Orthia, where the children, before the eyes of their parents, and in presence of the whole city, suffered themselves to be whipped till the blood ran down upon the altar of this cruel goddess, where sometimes they expired under the strokes, and all this without uttering the least cry, or so much as a groan or a sigh; and even their own fathers, when they saw them covered with blood, and ready to expire, exhorted them to persevere to the end, with constancy and resolution. Plutarch assures us, that he had seen with his own eyes a great many children lose their lives at the celebration of these cruel rites. Hence it is that Horace gives the epithet of patient to the city of Lacedæmon—*Patiens Lacedæmon*; and another author makes a man, who had received three strokes of a stick without complaining, say, "*Tres plagas Spartana nobilitate concori.*"—I have borne three strokes with Spartan nobleness."

A CHURCH OFFERING IN NORWAY!—There is a kind of pride among the Bonder (yeomen) to make a handsome one, a dollar or two, at Yule. The mode of presenting it is not very decorous. The clergyman, in his embroidered robes, is on his knees at the altar, after the service is performed, apparently absorbed in meditation and prayer. The people go round the altar in procession, and as each deposits his offering on the altar, the clergyman makes a nod of acknowledgment.—*Laing's Residence in Norway, 1836.*

TO CORRESPONDENTS.

We believe the principal difference between a Theocratist and us, is the body of Jesus Christ of Nazareth. He does not make the Saviour universal in his being, but confines him to an individual; we regard him as universal in his being, and consider the Son as existing in the Church, or any individual member of the true Christ, in the very same sense (but a different manifestation) in which he existed in Jesus Christ. But every man to his office. Jesus Christ the first, afterwards those that are associated with him. Christ, therefore, may come again in another individual, and still be the same Christ, for it is not the flesh but the spirit that is the Christ. Such is our meaning. We do not pretend to know where the body of Jesus Christ is, neither have we any authority to take the mystical language of prophecy in a literal sense. We believe that the Son of God was identified with Jesus Christ; but the Son of God, like God himself, is infinitely divisible, and is formed in every man who conceives him "the hope of glory." "Ye are the body of Christ, and members in particular." We suspect our Correspondent does not fully apprehend what we mean by the universal Christ. But we will try him again, by telling him that the universal Christ is the Church; that at present he is dead in the tomb, in hell; and that we are waiting at the tomb to see the Saviour arise, for it is only by the Church that salvation can come to the people. We allow that the last leading article was only a partial answer, but it was not written on purpose. To the inquiry respecting Mr. S., we reply—"not at present;" but he has it in contemplation when a suitable opening presents itself. We would be obliged to T. to point out any thing particular he observes in the public papers of interest to our inquiries.

We must have close readers for close writers.

[PRICE 1½d.]

TWO GODS.

"Thou art my Son; this day have I begotten thee."

"There are Lords many, and Gods many."—*Bible.*

Two Gods! why should there be two? why should there be three? why should the Gods be infinite in number, and yet all one? We cannot tell, but as the Yezedi said to Joseph Wolff, when he asked him why he did not pray, when he believed in a God,—“thus it is.”

God may be represented in a twofold light, theoretical and practical; or universal and particular. The first, according to Scripture, is the Father; the second is the Son.

The first is too great for our finite minds to comprehend; we are lost in the sublimity of the Father, but we have a fellow-feeling with the Son, who is God brought down to our comprehension.

The Son is the practical God—he is man. We cannot correspond *practically* with the Father; we require a mediator, and that mediator is our own human nature, directed by the Father's counsel.

When Moses saw God, it was not the theoretical or universal God, but the practical or particular manifestation (in shape and form) of a divine energy; when the prophets saw him in human shape, it was only a mediator that they saw. They could see nothing else. No man ever saw God—no angel or archangel ever saw God—God is invisible, and will be as invisible in heaven to eternity as he is now on earth.

“He that hath seen me,” says Christ, “hath seen the Father; I and the Father are one;” and no man is a Christian who cannot say the same. If the Church be the body of Christ, and the temple of the Holy Ghost, surely it has a right to say, like Christ,—“I and my Father are one; he that hath seen me, hath seen the Father.” We will never acknowledge a Church, nor a Christian, who does not confidently say the same. We do not want a human Church, destitute of divinity; we despise it. Of what benefit can it be to us? Whence does it derive its authority? what is the spirit that possesses it? who is its father? If the Father be divine, surely the Son should be a partaker of the divinity. With whom does it correspond? what are its means of communication between earth and heaven? has it direct influence from the Father? does it know the Father's will? has it the means of decisively ascertaining the Father's will on all important subjects of Church discipline? If not, pray, what is the Church but a usurpation—an alien from God?

Our venerable Church of England has not the courage to maintain that she has direct intercourse with the Father, and for this we despise her.

But how is this direct intercourse to be obtained? by a union of the Church upon Christian principles. “A new commandment I give unto you, that ye love one another;” “love even your enemies.” It is not theoretical love we mean, but practical; the active co-operation of the whole Christian Church to

adopt means for cultivating the minds and improving the condition of the universal population. This only requires an attempt. Love cannot fail, the people would flock around it. Only convince them that you do love them, and their hearts are won for ever. It is not enough to preach and pray to them, or expound the mysteries of metaphysical science to them, or to send them to the light within, when they are wading in the mud without. You must take them by the shoulders, and say to them, “here is food, and here is clothing, here is a comfortable dwelling; you must keep this dwelling clean, and yourselves clean, and your children clean; and you must send all your children to school; here are schools for them—here are baths for you. You are all members of the Church—you must study its interests, think seriously upon the modes of action and of instruction which it ought to pursue, appoint your representatives to maintain these modes, and let Providence determine the rest by the majority of the Church. You can do no more. But do not regard the Church as immutable, nor a decree of the Church this year to be binding for ever. The Church is progressive. Therefore, urge upon the people whatsoever you consider right, but always faithfully and patiently submit to the decisions of the majority. This is the practical God of the Church. This is the Son who is with it for ever. This is the Judge, who supersedes the Father. This is the infallible Head, whose bulls are just and right, until they be repealed by the same authority which emitted them.”

Society, so constituted, is the practical God. The theoretical God consigns all authority to this only-begotten and well-beloved Son.—“The Father judgeth no man, but hath committed all judgment unto the Son.”

When, therefore, our spiritual friends insist upon our crucifixion of self, we thoroughly agree with them; but when they inform us, that this self is the social self, that we are to abandon that duty which we owe to the practical God of society, and deliver ourselves up to the impractical God within ourselves, we say, “you know not what spirit ye are of; you are rejecting the Mediator; you are destroying your own and other men's peace of mind, by thrusting your head into the holiest of all without authority, only to be thrust out again in confusion of mind and defeat of purpose.”

“No man cometh unto the Father but by the Son.” We must seek God, not inwardly in ourselves singly, but in mankind socially. We must seek him in human nature. They that look to the light within their own special selves, without commingling their own light with that of others, will obtain a very miserable supply of illumination. The light within does not mean the light of your own sweet self, but the light of human nature. Mankind ought to be regarded as one man. Language is the uniting principle that combines the different members; it is the electric chain, through which the divine fluid is transmitted from soul to soul, and thus animates all with the same living spark. By this chain the mind that strikes the fire communicates it to all that are in immediate connexion with itself; and were this connexion more intimate and social, the sympathies of men would be more perfect, and the intercommunications of mind would be improved, like those of

roads and railways, which are the harbingers of a more intimate correspondence between individuals and nations.

To this social intercourse we look for the accomplishment of the promise of God dwelling with men. By this social intercourse the prejudices of different tribes and nations are gradually destroyed. Provinces that hitherto have hated or despised each other, on account of some slight difference of manner or speech, are being reconciled. Men are beginning to perceive, that differences of modes of thought, of worship, of speech, of dress, of form or complexion, do not involve the idea of moral guilt. Reconciliation is taking place; interchange of thoughts is opening up new views of religion and morals; bigotry is rapidly giving way to a spirit of toleration; intellectual discussion is breaking the chains and fetters of priestcraft and superstition; and in proportion to the facility of this intellectual intercourse and discussion is the work of the demolition of Babel's tower proceeding. Men are being prepared for unity.

And pray what is doing all this? Social and intellectual intercourse—the electric chord of society—the navel-string that unites every man to the practical God. Snap that chord, and the man falls away into the unfathomable abyss of the impractical or theoretical God, who has firmly declared, that no man shall come unto him but through the Son. They are dreamers all, who think they have found him except in *mankind*. The God in a single individual is an idol. They are idolaters who worship him; and he is an idolator who cannot perceive God in any other man but himself. The most interesting manifestations of Deity we have ever witnessed have been in fools and fatuated people. It is chiefly amongst them that prophetic powers are developed.* But the most practical and useful manifestations of the Deity are in the wise, who employ largely the intellectual and social means for re-uniting the scattered limbs of Christ's mystical body—the Church.

Now let us state again what is the difference between the two Gods of whom we speak. The one is the God of *Nature*, and the other the God of *Human Nature*. The latter is "The Son." The other won't speak to us. He

"Warms in the sun, refreshes in the breeze,
Glow in the stars, and blossoms on the trees,"

We live in him, breathe in him, and move in him; but it is only as man that we know him, and by the social intellect only that we know him as man.

But still the intellect is not the final resting-place. Love is the end. Love is the haven to which we are all sailing; it is only in love that we can find enjoyment—but it is social love, the love of one another. Mere love of God is an impossibility, an abstraction—"he that says he loveth God, and loveth not his brother, is a liar, and the truth is not in him." Hence God-love, as it is called, is merely an imposition of self-love, unless it be socially developed, and then it is social love.—"Love the Lord thy God with all thy heart, and thy neighbour as thyself; on these two commandments hang all the law and the prophets." Are they two commandments? No, indeed, they are merely one—"A new commandment I give unto you, that ye love one another." This is the two commandments in one.

Love is the end, but intellect is the means of promoting it; there is no intercourse without intellect—there is no union without intellect. By intellect the experience of all is brought into a heap, and made one; by intellect the stock of human observation is concentrated. But it is merely a servant. There is no satisfaction in mere intellectual pursuits, except in so far as they contribute to the moral and social feelings. How wonderfully every intellectual gem is enhanced by the idea that others are admiring the gem as well as ourselves, and that is may be instrumental in procuring some new blessing for society! But a mere intellectual idea, which is solitary in its origin, which is not meant to be communicated to others, which is not expected ever to be outwardly employed for any interesting purpose, is an idea of no value. The social feelings set

the price upon intellect; the social feelings are the best inspirers of genius. It is at the social board, where genius flashes with the fire of wit, and the blazonry of truth—it is in the true social spirit that the orator speaks and the penman writes, when they speak and write to the heart. Love—social love—is the God that inspires, and intellect is the vehicle which communicates the feelings by the use of written or spoken signs of speech.

"God is love"—social love; an idol is self love; and we may easily and practically determine the amount of divinity possessed by any individual by the breadth of love which his disposition manifests. But what sort of love is it that is valuable to society? not that sexual love which striplings exhibit towards one another, when they sigh and long for each other's society, and make every other person unhappy with their fretfulness, when their favourite is absent; this is rank selfishness: not that family love which wastes itself on some few individuals of kindred extraction, who have sprung from the same loins, and are known by the same name, who are christened after *me*, or suckled by *her*, and which has scarcely even common civility left for the other members of the family of God. Family affections are very useful and virtuous in a state of life like ours; but they may be carried to a selfish extent, by the shutting up of the spiritual affections for kinsmen of another description than those of flesh and blood. The broadest love is the best, it is the most generous, it has always obtained the richest tribute of admiration, because it requires the highest order of being, and the greatest sacrifice of individual feelings. It is the love which seeks the good of men, not of individuals only. It is such a love that Christ evidently meant when he requested his followers to abandon the luxuries of the world, and divide their substance with their fellow men and follow him. We candidly admit that it would be extremely foolish for single individuals to do this in the present state of society. It is a duty for society at large to perform *en masse*. It cannot be done on a small scale, to any effectual purpose. Individuals with money at command have more opportunities of doing good, and more good is really done by the judicious distribution of their wealth betimes, according to their own discretion, than could be effected by a total squandering of the principal among the poor, who would soon disperse the substance, and leave the scattered wealth to be gathered up by some coarser and more grasping mind than that which in charity dispensed it. But the faithful combination of Christian men and women, upon a principle of social affection, in which every individual would be domesticated as one of the great family of the church, every child properly educated, and reared to industry and honourable feeling, and every man and woman *practically* taught to regulate their passions and co-operate with God in limiting or extending the number of their offspring, according as the interests of society seemed to require it—such a union, we say, is not only simple and practicable, but is the only true Christian union, because it is the only method by which evil can be subdued and Satan's kingdom destroyed.

If you look for the destruction of Satan's reign of evil in the human heart, when some are exceedingly rich, others exceedingly poor, ill-fed, ill-clothed, and unhoused, you look for a delusion. It is no new doctrine that we teach, it is as old as society. Lycurgus knew it, and acted upon it in part, and Sparta kept his laws five hundred years, and actually ruled Greece, without the use of science or art. The arts and sciences were banished from Sparta; they were encouraged by Athens. Yet the Spartans were famous for wisdom and virtue; and the Athenians were famous for frivolity and caprice. But Sparta had social love and good manners; all her citizens dined at a common table, they were intimately known to each other. Social feeling is stronger than science. Solon, as a lawgiver, was weaker than Lycurgus, but, still, Solon knew and acknowledged what we have taught. According to Rollin, who takes his authority from Plutarch and Diogenes Laertius, Solon, "considered that such persons as have no fortune, and make use of no methods of industry to gain their livelihood, are ready to employ all manner of unjust and unlawful means for acquiring money; and that the necessity of subsisting some way or other then disposes them for committing all sorts of misdemeanours, rapine, knaveries, and frauds, from which spring up a school of vice in the bosom of the Common-

* The prophet is a fool, and the spiritual man is mad,—Hosea ix. 7.

wealth, and such a heaven gains ground as does not fail to spread its infection, and by degrees corrupt the manners of the public.

This is the true devil of society. Destroy this devil by a well concerted social plan, and society becomes Christ; and is infallible in promoting human happiness. "The comforter will lead you into all truth, and bring all things to your remembrance whatsoever I have said unto you." At present we are all of our Father, the Devil, and the lusts of our Father we do. The comforter is not yet come, but when he comes, the Devil our Father will be transformed into an angel of light. Hence, we are informed, in sacred allegory, that Satan is God's first born, and Christ the second born; each is a son, the first for evil, and the second for good, but the second is merely the first "born again." These two are one, and that one is merely the universal God manifested in human Nature; being one, two, three, seven, or as many as you can imagine, Monotheism, Tritheism, or Polytheism, according as you please to view the "All and in All."

SIR THOMAS MORE'S UTOPIA.

THE idea of Utopia* is evidently borrowed from Plato, and is illustrated in a more popular and less metaphysical style. It is more intelligible to the simple mind. Its truths are living truths, which even children may understand. The plan of the work is like that of an epic poem, and the description of Utopia and its interesting inhabitants, is related by a traveller of the name of Raphael, who is supposed to have visited the island, and to describe the outline of his own personal observations.

This Raphael Sir T. met at Antwerp, and in the introduction to Utopia an interesting conversation is recorded, in which all the principles of social community are discussed, and the truth pointed out by this hero of the poem. "Dreadful punishments," says Raphael, "are inflicted on thieves; but it were better to make good provisions that all might know how to gain a livelihood, and be preserved from the necessity of stealing, and of dying for it." This sentence contains the whole secret of the doctrine, namely, that evil ought to be prevented by kindness, not checked by punishment or fear. Society, however, in ignorance, has not attained to this enlightened conviction; and those whose sacred duty it is to teach this religion (for religion it really is) instead of pointing out the truth to the world, have merely striven to accommodate the principles of Christian love to the Satanic system of old society—"observing that the world would not suit their lives to Christ's rules, they (the preachers) have adapted his doctrine to their lives, that they might agree some way or other. But this compliance hath had no other effect than that men become more secure in their wickedness by it."

Of property and money, the substance of the author's opinions may be comprised in the following quotations:—"As long as there is any property, and money is the standard of all things else, I cannot think that a country can be governed justly or happily. Not justly, for the best things will fall to the lot of the best men; not happily, for all things will be divided among a few who are not completely happy, while the rest are in absolute misery." "I confess, that without destroying it (private property) entirely, the oppressions of many may be lightened, but they can never be quite removed. It will happen, as in a complication of disorders, that applying a remedy to one part, you do harm elsewhere."

Utopia, then, is an island five hundred miles in length, and about two hundred broad in some parts,† governed upon the foregoing political principles. It is a monarchy and republic in one; the prince is elective, and the suffrage is universal. The prince, however, is chosen by the syphogrants, or philarchs, and the syphogrants by the people.

Each philarch has the charge of thirty families, who elect him as their ruler. A country family consists of about forty persons, besides two slaves, and they live in town and country alternately; but in town a family consists of from ten to sixteen,

It consists of relations, but small families are made up from those which contain a surplus of children under age.

"The oldest man of every family presides in it. Wives obey their husbands, and children their parents—junior ever serving senior. Every city is divided into four equal parts, and in the middle of each is a market-place. What is manufactured by the several families, and brought thither, is carried to houses appointed for that purpose. In these all things of that kind are laid together, and every father goeth thither and taketh whatever he or his family need, without paying for it, or leaving any exchange. There is no reason for giving any one a denial, since they have such plenty of all things. And there is no danger of any one asking for more than he needeth, for, being sure they shall always be supplied, they have no inducement of the kind.

"It is the fear of want which rendereth any animal greedy or ravenous. And, besides this fear, there is a pride in man which maketh him esteem it a glory to excel his fellow-creatures in pomp and excess. The laws of Utopia leave no room for these feelings.

"Near these markets are others for every kind of provision. Here are herbs, fruit, bread, fish, fowl, and cattle. Without their towns are appointed places, near a running stream, for killing their beasts, which is done by their slaves. They allow none of the citizens to kill their cattle, thinking that pity and good nature (which are among the best of the affections born in us) are greatly impaired by butchering animals. Nor do they suffer any thing foul or unclean to be brought into their towns, lest the air be infected with ill scents, which might injure their health.

"In every street are spacious halls, lying at equal distances from each other, and distinguished by particular names. The syphogrants dwell in them with their thirty respective families, fifteen lying on one side, and as many on the other, and here they meet and hold their repasts. The steward of each goeth to the market at an appointed hour, and taketh home provision according to the number belonging to his hall."

The unpleasant services about these halls are done by slaves (who are convicts condemned to slavery for moral crimes); cooking and dressing are done by the women, and the youth of both sexes, between the ages of five and puberty, serve their elders at table.

"Thus live the inhabitants of towns. In the country, where they live at considerable distances asunder, every one eats at home, and no family is without necessary provision; for from them are sent provisions to those living in the towns."

Industry is universal. No one can leave his family to travel without a passport. If he be found rambling in idleness, without authority, he is punished; and, for a second offence, condemned to slavery.

"There are no idle people amongst them, nor any pretences for excusing any individual from labour. They have no taverns, ale-houses, or brothels, nor any other mediums of corruption, of gathering in corners, or forming parties. All live in full view, and all are obliged to do their duty, and employ well their leisure; and it is certain that a nation thus regulated must enjoy great abundance of all things, which being equally distributed, no one can want or be obliged to beg."

"At their great council at Amaurot (the capital), to which three from every town are sent yearly (annual parliaments), they examine what towns abound in provisions, and in which is any scarcity, that the one may be supplied from the other, and this is done without any exchange; for, according to their plenty or scarcity, they supply or are supplied, so that the whole island is, as it were, one family."

They have amassed considerable treasure by foreign commerce, chiefly exportation of surplus produce. This treasure is kept in reserve for unavoidable wars, in which foreigners are employed; but they employ gold and silver in domestic life in a manner somewhat original. Plate must convey a very different idea to their minds from ours, when chamber-pots, and close stools, and other vulgar utensils, are made of gold and silver. Slaves are fettered with gold and silver chains, and earrings of gold are hung upon some of them as badges of infamy. Under such training children are taught to despise gold, and

* Utopia means "a fine country."

† England is evidently meant by the author.

when the good of their country requires it, people have no objection to resign their chamber-pots and close-stools to pay the expences of a military campaign.

Pleasure is their *summum bonum*; this consists in temperance and social love—all excesses are reprobated. Their religion is simple natural theology; their morality unperverted by the fanaticism of divines and fearful fanatics; and universal toleration is granted for men to worship God as they please. There are varieties of religion amongst them; but as no persecution is employed, and no favouritism shown by government, no particular dislike is felt by individuals against those who differ from them, and proselytism is pursued with great composure.

Marriage is consecrated amongst them, and its duties and privileges strictly enforced. Adultery is punished with slavery, divorce not encouraged, but may be obtained by application to the prince, with consent of both parties; but no two parties ever engage in matrimonial compact without being first introduced to each other in a state of nature, "in beauty unadorned." "They wonder at the folly of mankind in all other countries, who, if they buy but an inferior horse, examine him all over, and take off his trappings; yet a wife, on whom dependeth the happiness of the remainder of life, they take upon trust, regarding only her face, and leaving the rest of her body covered, where contagious and loathsome disorders may be concealed."

We have heard of the paradise of fools; but where is the country that can lay claim to that venerable designation? here it is.

"They (the Utopians) take great pleasure in fools. It is esteemed base and unbecoming to use them ill, and they think it not amiss for people to divert themselves with their folly, and that it is an advantage to the fools. For were men so morose and severe, as not to be at all amused with their ridiculous behaviour, and foolish sayings (which is all they can do to recommend themselves to others), it could not be expected that they would be so well provided for, nor so tenderly used as otherwise."

This is the very attics of philosophy, we perfectly coincide with it. God has created fools, why should we not enjoy them? Only let them be put in their proper places, not in official situations, and in cathedral seats. Every man to his office. "To your tents, O Israel."

They have few laws, and every man understands them; no lawyers, and few priests, but the priests superintend the education of children. They are all taught not to fear death; and when life becomes burdensome by disease or age, the priest may give a warrant for an individual to remove himself by poison; but unwarranted suicide is accounted infamous.

The Utopian system seems to us to be defective in grandeur. There is a modest simplicity and comfort about it; but it is weak, it wants science and art, and the homeliness of a people who dye not their wool—and wear only one suit a year—and work in leather clothes which last seven—and whose families make their own clothes—and who require few of those artificial comforts which, amongst modern civilians, are now ranked amongst the necessities of life—is by no means alluring to our perhaps spoiled and perverted imaginations. Moreover, we do not see any necessity for such homeliness. We suspect that man cannot be refined inwardly without the instrumentality of outward refinements; the fine arts are especially useful in polishing the human being.

"Emolliunt mores nec sinunt esse ferus."

"They soften our manners, and preserve us from barbarism."

This defect belongs also to Plato's republic. We regard both, therefore, as unnatural; as pictures which in practice could not be realized, without introducing many instruments of polish which the ingenious authors have neglected to employ.

PRACTICAL NATIONAL EDUCATION.

It is not a very easy matter to make plain to other minds that which is deeply felt in one's own. The deeper the feeling, the more difficult the explanation in words. Now, as the well-fare of the human race, viewed in the phrase "Education," is to

me, the absorbing idea, I feel that my former letter, which you so far approved as to insert, will require on the part of the public some further discussion. Many things are too familiar and obvious to my mind to occur as necessary to be written of. To keep alive the subject and to vindicate, what may appear to some, mystic views, I hold myself ready to answer any objections, either inserted in your paper, or which may be left in writing at your publishers.

A little more experience will convince every religious and political party, as many are already convinced, that the courses hitherto pursued are no longer capable of preserving their order, and will not accomplish their proposed human improvement. As the age of brute force is passed, the powerful will endeavour to keep their power by mental influences, and "Education" will probably be the next popular demand. But why should it be expected that the education of the rising generation will preserve them from physical want or immoral actions? Not all the education the world has yet laboured at, has been able to preserve its chosen subjects from the wretched extremity of the gallows, nor from crimes as black as any which lead poverty to that end. Yet there is a latent feeling, nearly universal, that a further refinement of mind would prove a preventive of almost every evil. It is supposed that ignorance, or a want of more knowledge, is the reason that men are not so morally right, or so socially happy, as we all strongly feel they are capable of becoming. But friendly as I am to intellectual progress, I am convinced that other than intellectual results can never come from intellect. Sowing brute force you reap an animal result; sowing intellect you reap intellect; but upon a totally different basis must education proceed, if it is to arrive at a result different and better than has yet been exhibited. How shall a truly moral result be attained if we never so propose or think of it; or, thinking of it, conclude it will grow out of intellectual culture? As well might we expect a harvest of wheat where we have planted potatoes.

A correspondent who friendly charges me with obscurity wishes to know what is the "moral practice," recommended. "What are the teacher and his pupils to be doing for this hour per day?" I take it as good evidence of what I have asserted regarding the absence of moral or divine end in our systems that a most intelligent man informs me I am "not understood by him or ten readers of the *Shepherd*." He declares he has no idea whatever corresponding to my expressions. Such is no doubt the general condition of mere intellectual men. He is correct. I am not understood, nor should I be if I entered ever so much into the details of treatment suitable in my view to the mathematical, practical, grammatical, musical, or any other peculiar mental organization through which the universal voice may speak. Nay, were I actually at work, few would appreciate. But, be it respectfully declared to such friends, that it is for that reason I write. Were my aspirations commonly current, and on the high road to success, I need not put them forth. That which is adopted requires no advocate. The progressive scheme of to-day, becomes a hindrance and a stumbling block to progression to-morrow. Even that which I now recommend to support, I should myself, were it accomplished, be the first to supersede by something which would then be the mysticism of that day, as what I now put faintly forth is mysticism at this day. A pair of kitchen bellows were once mystical; now even the oxy-hydrogen blowpipe is a familiarity; and mystery dwells in the next undeveloped discovery.

While on the subject of reception and intelligibility, I cannot forbear relating a fact, which, I hope, will be a novelty to your readers, as it was indeed surprising to me, while it is enough to rouse a sluggard to action. In my neighbourhood I had observed an Infant School conducted by a female, in what I guessed to be a superior manner. Thinking such a teacher would be interested in the subject, I called with a copy of your No. 7, to leave her to read, and favour me with any remarks thereon. Being before school hours, I sent it into her room by an intelligent girl I saw in the school, but I had not departed many steps when she came after me with a message that "she thought I had better not leave it." From the poverty of the place I had not imagined she was a dependant on patronage. Her supporters would, perhaps, be astonished to learn that the effect

of their benevolence is so cruel as to reduce her to that condition which they pretend to deplore in Roman Catholic Countries. At all events my indignation against its authors was completely absorbed by unmixed pity for the poor victim. And does this occur, I asked, in the most enlightened district of the most enlightened nation in the world? But I believe that Islington is the most priest-ridden parish in England. If I mistake not, too, her party is the most liberal of them all, for there was a money-box in the school-room, labelled "Church Missionary Society," the party, I presume, in whose hands are the great Universities, and, by patent right, the morals and intellects of the rising generation. On me, who have never experienced in my own family, or in my connexions, anything like the rejection of an offer, because it might lead to deeper thought, to whom, till this hour, it had been an occurrence only reported, I must confess it made a deep and sad impression. A woman with talent enough to earn her bread in any situation in life, to be brought to such a state of miserable dependance that her *index expurgatorius* must extend to every scrap of paper, not sifted through some Committee of monied people, who have not half her abilities, is a result so deadly as to excite in me feelings similar to the occurrence of a murder. Indeed, it leads to nothing short of mind-murder—murder by starvation.
